i.MX 6Solo/6DualLite Applications Processor Reference Manual

Document Number: IMX6SDLRM
Rev. 5, 05/2020

Contents

Section number **Title** **Page**

Chapter 1
Introduction

1.1 About This Document....193

1.1.1 Audience....193

1.1.2 Organization....194

1.1.3 Suggested Reading....194

1.1.3.1 General Information....194

1.1.3.2 Related Documentation....194

1.1.4 Conventions....194

1.1.5 Register Access....196

1.1.5.1 Register Diagram Field Access Type Legend....196

1.1.5.2 Register Macro Usage....197

1.1.6 Signal Conventions....198

1.1.7 Acronyms and Abbreviations....198

1.2 Introduction....201

1.3 Target Applications....201

1.4 Features....202

1.5 Architectural Overview....206

1.5.1 Block Diagram....206

1.5.1.1 Simplified Block Diagram....206

1.5.2 Architectural Partitioning....207

1.5.3 Endianness Support....209

1.5.4 Memory Interfaces....209

Chapter 2
Memory Maps

2.1 Memory system overview....211

2.2 Arm Platform Memory Map....211

2.3 DDR mapping to MMDC controller ports....216

2.4 DMA memory map....217

Chapter 3
Interrupts and DMA Events

3.1 Overview....219
3.2 Cortex A9 interrupts....219
3.3 SDMA event mapping....223

Chapter 4
External Signals and Pin Multiplexing

4.1 Overview....225
4.1.1 Pin Assignments....225
4.1.2 Muxing Options....287

Chapter 5
Fusemap

5.1 Boot Fusemap....329
5.2 Fusemap Description Table....338

Chapter 6
External Memory Controllers

6.1 Overview....347
6.2 Multi-mode DDR controller (MMDC) overview and feature summary....347
6.3 Raw NAND flash controller overview....349
6.3.1 NAND interface features....350
6.3.2 NAND control features....351
6.3.3 Internal interface features....351
6.3.4 APBH-DMA overview....351
6.3.5 ECC-BCH features....351
6.4 EIM-PSRAM/NOR flash controller overview....352
6.4.1 EIM features....352
6.4.2 EIM boot scenarios....353
6.4.3 EIM boot configuration....353
6.4.4 OneNAND requirements....354

Chapter 7
System Debug

7.1 Overview....355

7.2 Chip and Arm Platform Debug Architecture....355

7.2.1 Debug Features....356

7.2.2 Debug system components....357

7.2.2.1 AMBA Trace Bus (ATB)....358

7.2.2.2 ATB replicator....358

7.2.2.3 Embedded Cross Triggering....358

7.2.2.3.1 Cross-Trigger Matrix (CTM)....359

7.2.2.3.2 Cross-Trigger Interface (CTI)....360

7.2.2.4 Debug Access Port (DAP)....360

7.2.2.5 Coresight Embedded Trace Buffer (ETB)....361

7.2.2.5.1 Performance Profiling with the ETB....362

7.2.2.5.2 ETB Counter Control....362

7.2.3 Chip-Specific SJC Features....363

7.2.3.1 JTAG Disable Mode....363

7.2.3.2 JTAG ID....363

7.2.4 System JTAG Controller - SJC....364

7.2.5 System JTAG controller main features....364

7.2.6 TAP Port....364

7.2.7 SJC main blocks....365

7.3 Smart DMA (SDMA) core....365

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary....366

7.3.1.1 Other SDMA Debug Functionality....367

7.3.1.2 SDMA ROM Patching....367

7.4 Miscellaneous....367

7.4.1 Clock/Reset/Power....367

7.5 Supported tools....368

Chapter 8
System Boot

8.1 Overview....369

8.2 Boot modes....371

8.2.1 Boot mode pin settings....371

8.2.2 High-level boot sequence....372

8.2.3 Boot From Fuses mode (BOOT_MODE[1:0] = 00b)....373

8.2.4 Serial Downloader....374

8.2.5 Internal Boot mode (BOOT_MODE[1:0] = 0b10)....375

8.2.6 Boot security settings....376

8.3 Device configuration....376

8.3.1 Boot eFUSE descriptions....377

8.3.2 GPIO boot overrides....379

8.3.3 Device Configuration Data (DCD)....380

8.4 Device initialization....380

8.4.1 Internal ROM/RAM memory map....380

8.4.2 Boot block activation....381

8.4.3 Clocks at boot time....382

8.4.4 Enabling MMU and caches....384

8.4.5 Exception handling....384

8.4.6 Interrupt handling during boot....385

8.4.7 Persistent bits....385

8.5 Boot devices (internal boot)....386

8.5.1 NOR flash/OneNAND using EIM interface....387

8.5.1.1 NOR flash boot operation....387

8.5.1.2 OneNAND flash boot operation....387

8.5.1.3 IOMUX configuration for EIM devices....388

8.5.2 NAND flash....389

8.5.2.1 NAND eFUSE configuration....390

8.5.2.2 NAND flash boot flow and Boot Control Blocks (BCB)..... 391
8.5.2.3 Firmware configuration block..... 395
8.5.2.4 Discovered Bad Block Table (DBBT)..... 398
8.5.2.5 Bad block handling in ROM..... 398
8.5.2.6 Toggle mode DDR NAND boot..... 399
8.5.2.6.1 GPMI and BCH clocks configuration..... 399
8.5.2.6.2 Setup DMA for DDR transfers..... 400
8.5.2.6.3 Reconfigure timing and speed using values in FCB..... 400
8.5.2.7 Typical NAND page organization..... 401
8.5.2.7.1 BCH ECC page organization..... 401
8.5.2.7.2 Metadata..... 402
8.5.2.8 IOMUX configuration for NAND..... 402
8.5.3 Expansion device..... 403
8.5.3.1 Expansion device eFUSE configuration..... 403
8.5.3.2 MMC and eMMC boot..... 406
8.5.3.3 SD, eSD, and SDXC..... 414
8.5.3.4 IOMUX configuration for SD/MMC..... 414
8.5.3.5 Redundant boot support for expansion device..... 415
8.5.4 Serial ROM through SPI and I2C..... 417
8.5.4.1 Serial ROM eFUSE configuration..... 417
8.5.4.2 I2C boot..... 418
8.5.4.2.1 I2C IOMUX pin configuration..... 419
8.5.4.3 ECSPI boot..... 419
8.5.4.3.1 ECSPI IOMUX pin configuration..... 421
8.6 Program image..... 422
8.6.1 Image Vector Table and Boot Data..... 422
8.6.1.1 Image vector table structure..... 423
8.6.1.2 Boot data structure..... 424
8.6.2 Device Configuration Data (DCD)..... 424

8.6.2.1 Write data command.... 426
8.6.2.2 Check data command.... 427
8.6.2.3 NOP command.... 429
8.6.2.4 Unlock command.... 429
8.7 Plugin image.... 430
8.8 Serial Downloader.... 430
8.8.1 USB.... 431
8.8.1.1 USB configuration details.... 432
8.8.1.2 IOMUX configuration for USB.... 433
8.8.2 Serial Download Protocol (SDP).... 433
8.8.2.1 SDP commands.... 434
8.8.2.1.1 READ_REGISTER.... 434
8.8.2.1.2 WRITE_REGISTER.... 435
8.8.2.1.3 WRITE_FILE.... 435
8.8.2.1.4 ERROR_STATUS.... 437
8.8.2.1.5 DCD_WRITE.... 437
8.8.2.1.6 JUMP_ADDRESS.... 438
8.9 Recovery devices.... 439
8.10 USB low-power boot.... 439
8.11 SD/MMC manufacture mode.... 441
8.11.1 Using manufacture mode / serial download mode with eMMC.... 442
8.12 High-Assurance Boot (HAB).... 443
8.12.1 HAB API vector table addresses.... 444

Chapter 9
Multimedia

9.1 Video Graphics Sub System.... 445
9.1.1 Display outputs.... 446
9.1.2 Video input.... 448
9.1.3 Synchronization Mechanisms.... 449

9.1.4 Supported applications....449
9.2 Image Processing Unit (IPU)....452
9.2.1 IPU External Ports....454
9.2.1.1 Camera Ports....455
9.2.1.2 Display Ports....456
9.2.1.2.1 Access Modes....456
9.2.1.2.2 Synchronous Access....456
9.2.1.2.3 Asynchronous Access....457
9.2.1.2.4 Interface details....457
9.2.1.2.5 Connecting To Display Devices....458
9.2.2 Processing....458
9.2.2.1 Display Processor (DP)....459
9.2.2.2 Video de-interlacer (VDIC)....460
9.2.2.3 Image Converter (IC)....460
9.2.2.4 Image Rotator (IRT)....461
9.2.3 Automatic Procedures....461
9.3 LVDS Display Bridge (LDB)....463
9.3.1 LDB Overview....463
9.3.2 LDB External Ports....464
9.3.3 Input Parallel Display Ports....464
9.3.3.1 Output LVDS Ports....464
9.3.3.2 Control signals....465
9.4 Video Data Order Adapter (VDOA)....465
9.5 Display Content Integrity Checker (DCIC)....465
9.6 Video Processing Unit (VPUv6)....465
9.6.1 Basic Structure....467
9.6.2 Feature summary....468
9.7 OpenGL ES 3D Graphics Processing Unit (GPU3Dv5)....468
9.7.1 OpenGL Overview....468

9.7.2 OpenGL Features ... 468
9.7.3 OpenGL Block Diagram ... 469
9.7.4 OpenGL Performance ... 469
9.7.5 OpenGL Software ... 470
9.8 2D Graphics Processing Unit (GPU2Dv2) ... 470
9.8.1 2D feature summary ... 470
9.8.2 2D Block Diagram ... 471
9.8.3 2D Performance ... 472
9.8.4 2D Software ... 472
9.9 HDMI TX - HD Multimedia Interface transmitter ... 472
9.9.1 HDMI Introduction ... 473
9.9.2 Features ... 474
9.10 Display / Sensor MIPI interfaces ... 475
9.10.1 Introduction ... 475
9.10.2 MIPI DSI ... 476
9.10.3 MIPI CSI-2 ... 477
9.10.4 D - PHY ... 478
9.11 Audio subsystem ... 479
9.11.1 Audio Subsystem Module Overview ... 480
9.11.2 Synchronous Serial Interface (SSI) ... 482
9.11.3 Digital Audio MUX (AUDMUX) ... 483
9.11.4 Enhanced Serial Audio Interface (ESAI) ... 485
9.11.5 Sony/Philips Digital Interface (SPDIF) ... 485
9.11.6 Asynchronous Sample Rate Converter (ASRC) ... 487

Chapter 10
Clock and Power Management

10.1 Introduction ... 491
10.2 Device Power Management Architecture Components ... 491
10.2.1 Centralized components of clock generation and management ... 492

10.2.2 Centralized components of power generation, distribution and management ... 493
10.2.3 Reset generation and distribution system ... 493
10.2.4 Power and clock management framework ... 493
10.3 Clock Management ... 494
10.3.1 Centralized components of clock management system ... 494
10.3.2 Clock generation ... 497
10.3.2.1 Crystal Oscillator (XTALOSC) ... 497
10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports ... 497
10.3.2.3 PLLs ... 497
10.3.2.3.1 General PLL Control and Status Functions ... 499
10.3.2.4 CCM ... 500
10.3.2.5 Low Power Clock Gating unit (LPCG) ... 500
10.3.3 Peripheral components of clock management system ... 501
10.3.3.1 Interface and functional clock ... 501
10.3.3.2 Block level clock management ... 502
10.3.3.2.1 Master clock protocol ... 503
10.3.3.2.2 Slave clock protocol ... 503
10.3.3.3 Clock Domain(s) ... 504
10.3.3.4 Domain level clock management ... 504
10.3.3.5 Domain dependencies ... 504
10.4 Power management ... 504
10.4.1 Centralized Components of Power Management System ... 505
10.4.1.1 Integrated PMU ... 505
10.4.1.1.1 Digital LDO Regulators ... 507
10.4.1.1.2 Analog LDO regulators ... 508
10.4.1.1.3 USB LDO ... 508
10.4.1.1.4 SNVS regulator ... 508
10.4.1.1.5 Reverse well biasing ... 509
10.4.1.2 GPC - General Power Controller ... 509

10.4.1.3 SRC - System reset Controller 509
10.4.1.4 Power domain(s) 510
10.4.1.4.1 Power distribution 511
10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating. 512
10.4.1.4.3 Power Gating Domain Management 512
10.4.1.4.3.1 Arm Core Platform 512
10.4.1.4.3.2 GPU3D, GPU2D and VPU 513
10.4.1.4.3.3 SoC 514
10.4.1.4.4 Power Gating domain dependencies 514
10.4.1.5 Voltage domains 515
10.4.1.6 Voltage domain management 515
10.4.1.6.1 Dynamic 515
10.4.1.6.1.1 Voltage Scaling 515
10.4.1.6.2 Static 515
10.4.1.6.2.1 Standby Leakage reduction (SLR) 515
10.4.1.6.2.2 ANALOG PHYs IPs 516
10.4.1.7 System domains layout 516
10.4.2 Power management techniques 518
10.4.2.1 Power saving techniques 519
10.4.2.2 Thermal-aware power management 520
10.4.2.3 Peripheral Power management 520
10.4.2.3.1 Main memory power management 520
10.4.2.3.2 IO power reduction 521
10.4.2.4 Examples of External Power Supply Interface 522
10.5 ONOFF (Button) 525

Chapter 11
System Security

11.1 Overview 527
11.2 Central Security Unit (CSU) 528

11.2.1 CSU Overview 528
11.2.2 CSU Features 528
11.2.3 CSU Functional Description 529
11.2.3.1 CSU Peripheral Access Policy 529
11.3 Cryptographic Acceleration and Assurance Module (CAAM) 530
11.3.1 CAAM Overview 530
11.4 Secure Non-Volatile Storage (SNVS) 531
11.4.1 SNVS Overview 531
11.4.2 Tamper Detection 531
11.5 Data Co-Processor (DCP) 532
11.6 High-Assurance Boot (HAB) 532
11.7 System JTAG Controller (SJC) 533

Chapter 12
ARM Cortex A9 MPCore Platform (ARM)

12.1 Overview 535
12.2 External Signals 535
12.3 Platform configuration 536
12.3.1 Platform and SCU configuration 537
12.3.2 Core configuration 537
12.3.3 PL310 L2 Cache configuration 537
12.3.4 Endian Modes 538
12.3.5 Memory Parity error support 538
12.4 Performance and Power 538
12.4.1 Low-Power design 538
12.4.1.1 SRPG (State Retention Power Gating) 539
12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS) 539
12.4.2 Clocks, frequency goals 539
12.4.2.1 ARM Clock 540
12.4.2.2 Bus Clocks 540

12.4.2.3 Debug Clocks....540
12.5 Core Platform Sub-Blocks details....540
12.5.1 ARM Cortex A9 MPCore Processor....540
12.5.2 Media Processing Engine (MPE - NEON)....541
12.5.3 Generic Interrupt Controller (GIC)....541
12.5.3.1 Interrupt Controller Features....541
12.5.3.2 About the Interrupt Controller....542
12.5.3.3 Interrupt Controller Clock frequency....542
12.5.3.4 TrustZone support....542
12.5.4 Instruction and data caches (L1)....542
12.5.4.1 L1 features....543
12.5.5 L2 Cache and controller (PL310)....543
12.6 Debug and Trace Sub-blocks (CoreSight components)....543
12.6.1 Debug Access Port (DAP)....543
12.6.2 Program Trace Macrocell (PTM)....544
12.6.2.1 Program Flow Trace (PFT)....544
12.6.3 Cross Trigger Interface (CTI)....545
12.6.4 Embedded Trace Buffer (ETB)....546
12.6.4.1 AMBA Trace Bus (ATB) Replicator....546

Chapter 13
AHB to IP Bridge (AIPSTZ)

13.1 Overview....547
13.1.1 Features....547
13.2 Clocks....547
13.3 Functional Description....548
13.4 Access Protections....549
13.5 Access Support....549
13.6 Initialization Information....550
13.6.1 Security Block....550

13.7 Off-Platform Peripherals Index....551
13.8 AIPSTZ Memory Map/Register Definition....554
13.8.1 Master Priviledge Registers (AIPSTZ*x*_MPR)....554
13.8.2 Off-Platform Peripheral Access Control Registers (AIPSTZ*x*_OPACR)....557
13.8.3 Off-Platform Peripheral Access Control Registers (AIPSTZ*x*_OPACR1)....560
13.8.4 Off-Platform Peripheral Access Control Registers (AIPSTZ*x*_OPACR2)....563
13.8.5 Off-Platform Peripheral Access Control Registers (AIPSTZ*x*_OPACR3)....566
13.8.6 Off-Platform Peripheral Access Control Registers (AIPSTZ*x*_OPACR4)....569

Chapter 14
AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

14.1 Overview....571
14.2 Clocks....572
14.3 APBH DMA....573
14.4 NAND Read Status Polling Example....578
14.5 APBH Memory Map/Register Definition....580
14.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0*n*)....586
14.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1*n*)....588
14.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2*n*)....591
14.5.4 AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL*n*)....596
14.5.5 AHB to APBH DMA Device Assignment Register (APBH_DEVSEL)....597
14.5.6 AHB to APBH DMA burst size (APBH_DMA_BURST_SIZE)....598
14.5.7 AHB to APBH DMA Debug Register (APBH_DEBUG)....599
14.5.8 APBH DMA Channel n Current Command Address Register (APBH_CH*n*_CURCMDAR)....600
14.5.9 APBH DMA Channel n Next Command Address Register (APBH_CH*n*_NXTCMDAR)....601
14.5.10 APBH DMA Channel n Command Register (APBH_CH*n*_CMD)....601
14.5.11 APBH DMA Channel n Buffer Address Register (APBH_CH*n*_BAR)....603
14.5.12 APBH DMA Channel n Semaphore Register (APBH_CH*n*_SEMA)....604
14.5.13 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG1)....605
14.5.14 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG2)....608

14.5.15 APBH Bridge Version Register (APBH_VERSION)..... 609

Chapter 15
Asynchronous Sample Rate Converter (ASRC)

15.1 Overview.....611
15.1.1 Features..... 613
15.1.2 Modes of Operation..... 614
15.1.2.1 Data Transfer Schemes..... 614
15.1.2.1.1 Data Input Modes.....615
15.1.2.1.2 Data Output Modes.....616
15.1.2.2 Word Alignment Supported 617
15.1.2.2.1 Input Data Alignment Modes 617
15.1.2.2.2 Output Data Alignment Modes 617
15.2 Clocks..... 618
15.3 Interrupts.....618
15.4 DMA requests..... 619
15.5 Functional Description.....619
15.5.1 Algorithm Description..... 619
15.5.1.1 Signal processing flow..... 619
15.5.1.2 Operation of the Filter.....623
15.5.1.2.1 Support of Physical Clocks.....623
15.6 Startup Procedure.....623
15.7 ASRC Memory Map/Register Definition..... 628
15.7.1 ASRC Control Register (ASRC_ASRCTR)..... 630
15.7.2 ASRC Interrupt Enable Register (ASRC_ASRIER)..... 633
15.7.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)..... 634
15.7.4 ASRC Filter Configuration Status Register (ASRC_ASRCFG)..... 636
15.7.5 ASRC Clock Source Register (ASRC_ASRCSR).....638
15.7.6 ASRC Clock Divider Register 1 (ASRC_ASRCDR1)..... 641
15.7.7 ASRC Clock Divider Register 2 (ASRC_ASRCDR2)..... 642

15.7.8 ASRC Status Register (ASRC_ASRSTR)....643
15.7.9 ASRC Parameter Register n (ASRC_ASRPMn*n*)....646
15.7.10 ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFR1)....647
15.7.11 ASRC Channel Counter Register (ASRC_ASRCCR)....648
15.7.12 ASRC Data Input Register for Pair *x* (ASRC_ASRDI*n*)....649
15.7.13 ASRC Data Output Register for Pair *x* (ASRC_ASRDO*n*)....649
15.7.14 ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA)....650
15.7.15 ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA)....650
15.7.16 ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB)....651
15.7.17 ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB)....651
15.7.18 ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC)....652
15.7.19 ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC)....652
15.7.20 ASRC 76 kHz Period in terms of ASRC processing clock (ASRC_ASR76K)....653
15.7.21 ASRC 56 kHz Period in terms of ASRC processing clock (ASRC_ASR56K)....654
15.7.22 ASRC Misc Control Register for Pair A (ASRC_ASRMCRA)....655
15.7.23 ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA)....657
15.7.24 ASRC Misc Control Register for Pair B (ASRC_ASRMCRB)....658
15.7.25 ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB)....660
15.7.26 ASRC Misc Control Register for Pair C (ASRC_ASRMCRC)....661
15.7.27 ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC)....663
15.7.28 ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1*n*)....664

Chapter 16
Digital Audio Multiplexer (AUDMUX)

16.1 Overview....667
16.1.1 Features....669
16.1.2 Modes and Operations....669
16.2 External Signals....669
16.3 Clocks....670
16.3.1 Clock Inputs....671

16.3.2 Clock Diagram....671
16.3.3 Clocking Restrictions....672
16.4 Default Register Configuration....672
16.4.1 Default Port Configuration....672
16.5 Functional Description....672
16.5.1 Operating Modes....672
16.5.1.1 Port Receive Data Modes....674
16.5.1.1.1 Normal Mode....675
16.5.1.1.2 Internal Network Mode....676
16.5.1.1.3 Transmit Data Output Enable Assertion....682
16.5.1.2 Tx/Rx Switch and External Network Mode....683
16.5.1.3 Timing Modes....684
16.5.1.3.1 Synchronous Mode (4-Wire Interface)....684
16.5.1.3.2 Asynchronous Mode (6-Wire Interface)....686
16.5.2 Connectivity Between Ports....689
16.5.2.1 Internal Port to External Port Connectivity....690
16.5.2.2 External Port to External Port Connectivity....691
16.5.2.3 Internal Port to Internal Port Connectivity....691
16.5.2.4 Loopback Connectivity....692
16.6 AUDMUX Memory Map/Register Definition....692
16.6.1 Port Timing Control Register 1 (AUDMUX_PTCR1)....693
16.6.2 Port Data Control Register 1 (AUDMUX_PDCR1)....695
16.6.3 Port Timing Control Register 2 (AUDMUX_PTCR2)....696
16.6.4 Port Data Control Register 2 (AUDMUX_PDCR2)....698
16.6.5 Port Timing Control Register 3 (AUDMUX_PTCR3)....699
16.6.6 Port Data Control Register 3 (AUDMUX_PDCR3)....701
16.6.7 Port Timing Control Register 4 (AUDMUX_PTCR4)....702
16.6.8 Port Data Control Register 4 (AUDMUX_PDCR4)....704
16.6.9 Port Timing Control Register 5 (AUDMUX_PTCR5)....705

16.6.10 Port Data Control Register 5 (AUDMUX_PDCR5)....707
16.6.11 Port Timing Control Register 6 (AUDMUX_PTCR6)....708
16.6.12 Port Data Control Register 6 (AUDMUX_PDCR6)....710
16.6.13 Port Timing Control Register 7 (AUDMUX_PTCR7)....711
16.6.14 Port Data Control Register 7 (AUDMUX_PDCR7)....713

Chapter 17
40-BIT Correcting ECC Accelerator (BCH)

17.1 Overview....715
17.2 Operation....717
17.2.1 BCH Limitations and Assumptions....718
17.2.2 Flash Page Layout....719
17.2.3 Determining the ECC layout for a device....721
17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213)....721
17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata....722
17.2.4 Data Buffers in System Memory....722
17.3 Memory to Memory (Loopback) Operation....724
17.4 Programming the BCH/GPMI Interfaces....725
17.4.1 BCH Encoding for NAND Writes....725
17.4.1.1 DMA Structure Code Example....728
17.4.1.2 Using the BCH Encoder....733
17.4.2 BCH Decoding for NAND Reads....734
17.4.2.1 DMA Structure Code Example....738
17.4.2.2 Using the Decoder....741
17.4.3 Interrupts....743
17.5 Behavior During Reset....744
17.6 BCH Memory Map/Register Definition....745
17.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRL*n*)....746
17.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0)....749

17.6.3 Hardware ECC Accelerator Mode Register (BCH_MODE)..... 750
17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR).....751
17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR)..... 751
17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR).....752
17.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT)..... 752
17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0).....754
17.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1).....756
17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0).....757
17.6.11 Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1).....759
17.6.12 Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0).....760
17.6.13 Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1).....762
17.6.14 Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0).....763
17.6.15 Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1).....765
17.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0*n*)..... 766
17.6.17 KES Debug Read Register (BCH_DBGKESREAD)..... 768
17.6.18 Chien Search Debug Read Register (BCH_DBGCSFEREAD)..... 769
17.6.19 Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD).....769
17.6.20 Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD).....770
17.6.21 Block Name Register (BCH_BLOCKNAME)..... 770
17.6.22 BCH Version Register (BCH_VERSION)..... 771
17.6.23 Hardware BCH ECC Debug Register 1 (BCH_DEBUG1)..... 772

Chapter 18
Clock Controller Module (CCM)

18.1 Overview.....775
18.1.1 Features..... 775
18.1.2 CCM Block Diagram..... 776
18.2 External Signals..... 778
18.3 CCM Clock Tree.....778
18.4 System Clocks.....782

18.5 Functional Description....793
18.5.1 Clock Generation....793
18.5.1.1 External Low Frequency Clock - CKIL....793
18.5.1.1.1 CKIL synchronizing to IPG_CLK....793
18.5.1.2 External High Frequency Clock - CKIH and internal oscillator....794
18.5.1.3 PLL reference clock....794
18.5.1.3.1 ARM PLL (PLL1)....794
18.5.1.3.2 System PLL (PLL2)....794
18.5.1.3.3 USB1 PLL (PLL3)....795
18.5.1.3.4 Audio PLL (PLL4)....795
18.5.1.3.5 Video PLL (PLL5)....796
18.5.1.3.6 MLB PLL....796
18.5.1.3.7 Ethernet PLL (PLL6)....796
18.5.1.3.8 USB2 PLL (PLL7)....796
18.5.1.4 Phase Fractional Dividers (PFD)....796
18.5.1.5 CCM internal clock generation....797
18.5.1.5.1 Clock Switcher....797
18.5.1.5.2 PLL bypass procedure....799
18.5.1.5.3 PLL clock change....799
18.5.1.5.4 Clock Root Generator....799
18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC)....811
18.5.1.5.6 Divider change handshake....812
18.5.1.6 Disabling / Enabling PLLs....812
18.5.1.7 Clock Switching Multiplexers....812
18.5.1.8 Low Power Clock Gating module (LPCG)....815
18.5.1.9 MMDC handshake....816
18.5.2 DVFS support....817
18.5.3 Power modes....817
18.5.3.1 RUN mode....817

18.5.3.2 WAIT mode ... 817
18.5.3.2.1 Entering WAIT mode ... 817
18.5.3.2.2 Exiting WAIT mode ... 818
18.5.3.3 STOP mode ... 818
18.5.3.3.1 Entering STOP mode ... 818
18.5.3.3.2 Exiting STOP mode ... 819
18.6 CCM Memory Map/Register Definition ... 820
18.6.1 CCM Control Register (CCM_CCR) ... 822
18.6.2 CCM Control Divider Register (CCM_CCDR) ... 824
18.6.3 CCM Status Register (CCM_CSR) ... 825
18.6.4 CCM Clock Switcher Register (CCM_CCSR) ... 826
18.6.5 CCM Arm Clock Root Register (CCM_CACRR) ... 828
18.6.6 CCM Bus Clock Divider Register (CCM_CBCDR) ... 829
18.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR) ... 832
18.6.8 CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1) ... 834
18.6.9 CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2) ... 837
18.6.10 CCM Serial Clock Divider Register 1 (CCM_CSCDR1) ... 838
18.6.11 CCM SSI1 Clock Divider Register (CCM_CS1CDR) ... 841
18.6.12 CCM SSI2 Clock Divider Register (CCM_CS2CDR) ... 842
18.6.13 CCM D1 Clock Divider Register (CCM_CDCDR) ... 844
18.6.14 CCM HSC Clock Divider Register (CCM_CHSCCDR) ... 846
18.6.15 CCM Serial Clock Divider Register 2 (CCM_CSCDR2) ... 849
18.6.16 CCM Serial Clock Divider Register 3 (CCM_CSCDR3) ... 851
18.6.17 CCM Divider Handshake In-Process Register (CCM_CDHIPR) ... 853
18.6.18 CCM Low Power Control Register (CCM_CLPCR) ... 856
18.6.19 CCM Interrupt Status Register (CCM_CISR) ... 859
18.6.20 CCM Interrupt Mask Register (CCM_CIMR) ... 862
18.6.21 CCM Clock Output Source Register (CCM_CCOSR) ... 865
18.6.22 CCM General Purpose Register (CCM_CGPR) ... 868

18.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)....869
18.6.24 CCM Clock Gating Register 1 (CCM_CCGR1)....871
18.6.25 CCM Clock Gating Register 2 (CCM_CCGR2)....872
18.6.26 CCM Clock Gating Register 3 (CCM_CCGR3)....874
18.6.27 CCM Clock Gating Register 4 (CCM_CCGR4)....875
18.6.28 CCM Clock Gating Register 5 (CCM_CCGR5)....876
18.6.29 CCM Clock Gating Register 6 (CCM_CCGR6)....878
18.6.30 CCM Module Enable Overide Register (CCM_CMEOR).... 879
18.7 CCM Analog Memory Map/Register Definition....880
18.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM*n*).... 884
18.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1*n*).... 886
18.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2*n*).... 889
18.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYS*n*)....891
18.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).... 893
18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM).... 893
18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM).... 894
18.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO*n*)....895
18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM).. 897
18.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)....897
18.7.11 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO*n*).... 899
18.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)...901
18.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).... 901
18.7.14 MLB PLL Control Register (CCM_ANALOG_PLL_MLB*n*).... 902
18.7.15 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET*n*).... 904
18.7.16 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480*n*)..... 905
18.7.17 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528*n*)..... 907

18.7.18 Miscellaneous Register 0 (CCM_ANALOG_MISC0*n*)..... 910
18.7.19 Miscellaneous Register 1 (CCM_ANALOG_MISC1*n*)..... 914
18.7.20 Miscellaneous Register 2 (CCM_ANALOG_MISC2*n*)..... 917

Chapter 19
MIPI CSI to IPU Gasket (CSI2IPU)

19.1 Overview..... 923
19.1.1 CSI2IPU feature summary..... 924
19.1.2 CSI2IPU architectural description..... 924
19.2 CSI2IPU signals..... 925
19.3 Timing interface..... 926
19.4 Payload data output formats..... 927
19.5 CSI2IPU Memory Map/Register Definition..... 934
19.5.1 CSI 2 IPU Gasket Software Reset (CSI2IPU_SW_RST)..... 935

Chapter 20
Display Content Integrity Checker (DCIC)

20.1 Overview..... 937
20.1.1 Block Diagram..... 938
20.1.2 Features..... 939
20.2 Functional Description..... 939
20.2.1 Generic synchronous parallel display interface..... 939
20.2.2 CRC Polynomial..... 940
20.2.3 Mode of operation..... 941
20.2.4 Interrupts..... 941
20.2.5 Software reset..... 941
20.2.6 Clock domains..... 942
20.2.7 External controller mismatch indication signal..... 942
20.2.8 Power saving..... 942
20.2.9 System Considerations..... 942
20.3 DCIC Memory Map/Register Definition..... 943

20.3.1 DCIC Control Register (DCIC*x*_DCICC)..... 944
20.3.2 DCIC Interrupt Control Register (DCIC*x*_DCICIC)..... 945
20.3.3 DCIC Status Register (DCIC*x*_DCICS)..... 946
20.3.4 DCIC ROI Config Register m (DCIC*x*_DCICRC)..... 947
20.3.5 DCIC ROI Size Register m (DCIC*x*_DCICRS)..... 948
20.3.6 DCIC ROI Reference Signature Register m (DCIC*x*_DCICRRS)..... 949
20.3.7 DCIC ROI Calculated Signature m (DCIC*x*_DCICRCS)..... 949

Chapter 21
Enhanced Configurable SPI (ECSPI)

21.1 Overview..... 951
21.1.1 Features..... 952
21.1.2 Modes and Operations..... 952
21.2 External Signals..... 953
21.3 Clocks..... 956
21.4 Functional Description..... 956
21.4.1 Master Mode..... 957
21.4.2 Slave Mode..... 957
21.4.3 Low Power Modes..... 957
21.4.4 Operations..... 957
21.4.4.1 Typical Master Mode..... 957
21.4.4.1.1 Master Mode with SPI_RDY..... 958
21.4.4.1.2 Master Mode with Wait States..... 960
21.4.4.1.3 Master Mode with SS_CTL[3:0] Control..... 960
21.4.4.1.4 Master Mode with Phase Control..... 961
21.4.4.2 Typical Slave Mode..... 962
21.4.5 Reset..... 963
21.4.6 Interrupts..... 963
21.4.7 DMA..... 965
21.4.8 Byte Order..... 966

21.5 Initialization....966
21.6 Applications....966
21.7 ECSPI Memory Map/Register Definition....967
21.7.1 Receive Data Register (ECSPI*x*_RXDATA)....969
21.7.2 Transmit Data Register (ECSPI*x*_TXDATA)....970
21.7.3 Control Register (ECSPI*x*_CONREG)....970
21.7.4 Config Register (ECSPI*x*_CONFIGREG)....973
21.7.5 Interrupt Control Register (ECSPI*x*_INTREG)....975
21.7.6 DMA Control Register (ECSPI*x*_DMAREG)....976
21.7.7 Status Register (ECSPI*x*_STATREG)....978
21.7.8 Sample Period Control Register (ECSPI*x*_PERIODREG)....979
21.7.9 Test Control Register (ECSPI*x*_TESTREG)....981
21.7.10 Message Data Register (ECSPI*x*_MSGDATA)....982

Chapter 22
External Interface Module (EIM)

22.1 Overview....983
22.1.1 Features....985
22.1.2 Modes of Operation....985
22.1.2.1 Asynchronous Mode....986
22.1.2.2 Asynchronous Page Read Mode....986
22.1.2.3 Multiplexed Address/Data Mode....986
22.1.2.4 Burst Clock Mode....987
22.1.2.5 Low Power Modes....988
22.1.2.6 Boot Mode....988
22.2 External Signals....988
22.2.1 Other Important Block I/O Signals Internal to the SoC....993
22.3 Clocks....994
22.4 Chip Select Memory Map....995
22.5 Functional Description....995

22.5.1 Continuous BCLK....995
22.5.2 Bus Sizing Configuration....996
22.5.2.1 8 BIT PORT SUPPORT....997
22.5.2.1.1 MOTOROLA 68000....997
22.5.2.1.2 INTEL 386....997
22.5.3 EIM Operational Modes....997
22.5.4 Burst Mode (Synchronous) Memory Operation....998
22.5.5 Burst Clock Divisor (BCD)....999
22.5.6 Burst Clock Start (BCS)....999
22.5.7 Multiplexed Address/Data Mode Support....1000
22.5.8 Mixed Master/Memory Burst Modes Support....1000
22.5.9 AXI (Master) Bus Cycles Support....1000
22.5.10 WAIT_B Signal, RWSC and WWSC bit fields Usage....1003
22.5.11 IPS Register Interface....1003
22.5.12 MRS Set for PSRAM....1003
22.5.13 EIM Access Termination....1004
22.5.14 Error Conditions....1004
22.5.15 DTACK Mode....1005
22.5.16 RDY_INT Signal as Interrupt....1005
22.5.17 RDY_INT Signal as Ready After Reset Indication....1005
22.5.18 EIM_GRANT / EIM_BUSY Handshake Description....1006
22.5.19 LPMD / LPACK Handshake Description....1006
22.5.20 Endianness....1006
22.5.21 Strobe Signal Use....1007
22.6 Initialization Information....1008
22.6.1 Booting from EIM....1008
22.7 Typical Application....1008
22.7.1 Access to Intel Sibley Flash....1009
22.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration....1009

22.7.1.2 Intel Sibley Flash Synchronous Mode Configuration....1009
22.7.1.3 Intel Sibley Flash Utility....1009
22.7.2 Access to MDOC Device....1010
22.7.2.1 MDOC Device Boot....1010
22.7.2.2 MDOC Device Asynchronous Mode Configuration....1010
22.7.2.3 MDOC Device Utility....1010
22.7.3 Access to Micron PSRAM....1011
22.7.3.1 Micron PSRAM Asynchronous Mode Configuration....1011
22.7.3.2 Micron PSRAM Synchronous Mode Configuration....1011
22.7.4 Access to Samsung OneNAND....1011
22.7.4.1 Samsung OneNAND Boot....1011
22.7.4.2 Samsung OneNAND Asynchronous Mode Configuration....1012
22.7.4.3 Samsung OneNAND Synchronous Mode Configuration....1012
22.7.4.4 Samsung OneNAND Utility....1012
22.7.5 Access to Samsung UtRAM....1013
22.7.5.1 Samsung UtRAM Asynchronous Mode Configuration....1013
22.7.5.2 Samsung UtRAM Synchronous Mode Configuration....1013
22.7.6 Access to Spansion Flash....1013
22.7.6.1 Spansion Flash Asynchronous Mode Configuration....1014
22.7.6.2 Spansion Flash Synchronous Mode Configuration....1014
22.7.6.3 Spansion Flash Utility....1014
22.7.7 8 bit support....1016
22.8 External Bus Timing Diagrams....1016
22.8.1 Asynchronous Read Memory Accesses Timing Diagram....1016
22.8.2 Asynchronous Write Memory Accesses Timing Diagram....1017
22.8.3 Asynchronous Read/Write Memory Accesses Timing Diagram....1018
22.8.4 Asynchronous Read/Write Using RAL, WAL and CSREC....1020
22.8.5 Consecutive Asynchronous Write Memory Accesses Timing Diagram....1021
22.8.6 Consecutive Asynchronous Read Memory Accesses Timing Diagram....1024

22.8.7 Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0 1026
22.8.8 Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1 1027
22.8.9 Burst (Synchronous Mode) Write Memory Access Timing - BCD=1 1028
22.8.10 Asynchronous Page Mode Access 1030
22.8.11 DTACK Mode - AXI Single Access 1030
22.8.12 DTACK Mode - AXI Single Write Access 1033
22.8.13 DTACK Mode - AXI Burst Access 1034
22.9 EIM Memory Map/Register Definition 1035
22.9.1 Chip Select n General Configuration Register 1 (EIM_CS*n*GCR1) 1038
22.9.2 Chip Select n General Configuration Register 2 (EIM_CS*n*GCR2) 1042
22.9.3 Chip Select n Read Configuration Register 1 (EIM_CS*n*RCR1) 1043
22.9.4 Chip Select n Read Configuration Register 2 (EIM_CS*n*RCR2) 1046
22.9.5 Chip Select n Write Configuration Register 1 (EIM_CS*n*WCR1) 1047
22.9.6 Chip Select n Write Configuration Register 2 (EIM_CS*n*WCR2) 1050
22.9.7 EIM Configuration Register (EIM_WCR) 1051
22.9.8 DLL Control Register (EIM_DCR) 1053
22.9.9 DLL Status Register (EIM_DSR) 1054
22.9.10 EIM IP Access Register (EIM_WIAR) 1055
22.9.11 Error Address Register (EIM_EAR) 1056

Chapter 23
10/100/1000-Mbps Ethernet MAC (ENET)

23.1 Introduction 1057
23.2 Overview 1057
23.2.1 Features 1058
23.2.1.1 Ethernet MAC features 1058
23.2.1.2 IP protocol performance optimization features 1059
23.2.1.3 IEEE 1588 features 1060
23.2.2 Block diagram 1060
23.3 External Signals 1061

23.4 Clocks ... 1066
23.5 Memory map/register definition ... 1067
23.5.1 Interrupt Event Register (ENET_EIR) ... 1072
23.5.2 Interrupt Mask Register (ENET_EIMR) ... 1075
23.5.3 Receive Descriptor Active Register (ENET_RDAR) ... 1078
23.5.4 Transmit Descriptor Active Register (ENET_TDAR) ... 1078
23.5.5 Ethernet Control Register (ENET_ECR) ... 1080
23.5.6 MII Management Frame Register (ENET_MMFR) ... 1082
23.5.7 MII Speed Control Register (ENET_MSCR) ... 1083
23.5.8 MIB Control Register (ENET_MIBC) ... 1085
23.5.9 Receive Control Register (ENET_RCR) ... 1087
23.5.10 Transmit Control Register (ENET_TCR) ... 1090
23.5.11 Physical Address Lower Register (ENET_PALR) ... 1092
23.5.12 Physical Address Upper Register (ENET_PAUR) ... 1092
23.5.13 Opcode/Pause Duration Register (ENET_OPD) ... 1093
23.5.14 Descriptor Individual Upper Address Register (ENET_IAUR) ... 1093
23.5.15 Descriptor Individual Lower Address Register (ENET_IALR) ... 1094
23.5.16 Descriptor Group Upper Address Register (ENET_GAUR) ... 1094
23.5.17 Descriptor Group Lower Address Register (ENET_GALR) ... 1095
23.5.18 Transmit FIFO Watermark Register (ENET_TFWR) ... 1095
23.5.19 Receive Descriptor Ring Start Register (ENET_RDSR) ... 1096
23.5.20 Transmit Buffer Descriptor Ring Start Register (ENET_TDSR) ... 1097
23.5.21 Maximum Receive Buffer Size Register (ENET_MRBR) ... 1098
23.5.22 Receive FIFO Section Full Threshold (ENET_RSFL) ... 1099
23.5.23 Receive FIFO Section Empty Threshold (ENET_RSEM) ... 1099
23.5.24 Receive FIFO Almost Empty Threshold (ENET_RAEM) ... 1100
23.5.25 Receive FIFO Almost Full Threshold (ENET_RAFL) ... 1100
23.5.26 Transmit FIFO Section Empty Threshold (ENET_TSEM) ... 1101
23.5.27 Transmit FIFO Almost Empty Threshold (ENET_TAEM) ... 1101

23.5.28 Transmit FIFO Almost Full Threshold (ENET_TAFL)..... 1102
23.5.29 Transmit Inter-Packet Gap (ENET_TIPG)..... 1102
23.5.30 Frame Truncation Length (ENET_FTRL)..... 1103
23.5.31 Transmit Accelerator Function Configuration (ENET_TACC)..... 1103
23.5.32 Receive Accelerator Function Configuration (ENET_RACC)..... 1104
23.5.33 Reserved Statistic Register (ENET_RMON_T_DROP)..... 1105
23.5.34 Tx Packet Count Statistic Register (ENET_RMON_T_PACKETS)..... 1106
23.5.35 Tx Broadcast Packets Statistic Register (ENET_RMON_T_BC_PKT)..... 1106
23.5.36 Tx Multicast Packets Statistic Register (ENET_RMON_T_MC_PKT)..... 1107
23.5.37 Tx Packets with CRC/Align Error Statistic Register (ENET_RMON_T_CRC_ALIGN)..... 1107
23.5.38 Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET_RMON_T_UNDERSIZE)..... 1108
23.5.39 Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET_RMON_T_OVERSIZE)..... 1108
23.5.40 Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_T_FRAG)..... 1109
23.5.41 Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET_RMON_T_JAB).... 1109
23.5.42 Tx Collision Count Statistic Register (ENET_RMON_T_COL)..... 1110
23.5.43 Tx 64-Byte Packets Statistic Register (ENET_RMON_T_P64)..... 1110
23.5.44 Tx 65- to 127-byte Packets Statistic Register (ENET_RMON_T_P65TO127)..... 1111
23.5.45 Tx 128- to 255-byte Packets Statistic Register (ENET_RMON_T_P128TO255)..... 1111
23.5.46 Tx 256- to 511-byte Packets Statistic Register (ENET_RMON_T_P256TO511)..... 1112
23.5.47 Tx 512- to 1023-byte Packets Statistic Register (ENET_RMON_T_P512TO1023)..... 1112
23.5.48 Tx 1024- to 2047-byte Packets Statistic Register (ENET_RMON_T_P1024TO2047)..... 1113
23.5.49 Tx Packets Greater Than 2048 Bytes Statistic Register (ENET_RMON_T_P_GTE2048)..... 1113
23.5.50 Tx Octets Statistic Register (ENET_RMON_T_OCTETS)..... 1113
23.5.51 Reserved Statistic Register (ENET_IEEE_T_DROP)..... 1114
23.5.52 Frames Transmitted OK Statistic Register (ENET_IEEE_T_FRAME_OK)..... 1114
23.5.53 Frames Transmitted with Single Collision Statistic Register (ENET_IEEE_T_1COL)..... 1115
23.5.54 Frames Transmitted with Multiple Collisions Statistic Register (ENET_IEEE_T_MCOL)..... 1115
23.5.55 Frames Transmitted after Deferral Delay Statistic Register (ENET_IEEE_T_DEF)..... 1116
23.5.56 Frames Transmitted with Late Collision Statistic Register (ENET_IEEE_T_LCOL)..... 1116

23.5.57 Frames Transmitted with Excessive Collisions Statistic Register (ENET_IEEE_T_EXCOL)..... 1117
23.5.58 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET_IEEE_T_MACERR)..... 1117
23.5.59 Frames Transmitted with Carrier Sense Error Statistic Register (ENET_IEEE_T_CSERR)..... 1118
23.5.60 Reserved Statistic Register (ENET_IEEE_T_SQE)..... 1118
23.5.61 Flow Control Pause Frames Transmitted Statistic Register (ENET_IEEE_T_FDXFC)..... 1119
23.5.62 Octet Count for Frames Transmitted w/o Error Statistic Register (ENET_IEEE_T_OCTETS_OK)..... 1119
23.5.63 Rx Packet Count Statistic Register (ENET_RMON_R_PACKETS)..... 1120
23.5.64 Rx Broadcast Packets Statistic Register (ENET_RMON_R_BC_PKT)..... 1120
23.5.65 Rx Multicast Packets Statistic Register (ENET_RMON_R_MC_PKT)..... 1121
23.5.66 Rx Packets with CRC/Align Error Statistic Register (ENET_RMON_R_CRC_ALIGN)..... 1121
23.5.67 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET_RMON_R_UNDERSIZE)..... 1122
23.5.68 Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENET_RMON_R_OVERSIZE)..... 1122
23.5.69 Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_R_FRAG)..... 1123
23.5.70 Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENET_RMON_R_JAB)... 1123
23.5.71 Reserved Statistic Register (ENET_RMON_R_RESVD_0)..... 1123
23.5.72 Rx 64-Byte Packets Statistic Register (ENET_RMON_R_P64)..... 1124
23.5.73 Rx 65- to 127-Byte Packets Statistic Register (ENET_RMON_R_P65TO127)..... 1124
23.5.74 Rx 128- to 255-Byte Packets Statistic Register (ENET_RMON_R_P128TO255)..... 1125
23.5.75 Rx 256- to 511-Byte Packets Statistic Register (ENET_RMON_R_P256TO511)..... 1125
23.5.76 Rx 512- to 1023-Byte Packets Statistic Register (ENET_RMON_R_P512TO1023)..... 1126
23.5.77 Rx 1024- to 2047-Byte Packets Statistic Register (ENET_RMON_R_P1024TO2047)..... 1126
23.5.78 Rx Packets Greater than 2048 Bytes Statistic Register (ENET_RMON_R_P_GTE2048)..... 1127
23.5.79 Rx Octets Statistic Register (ENET_RMON_R_OCTETS)..... 1127
23.5.80 Frames not Counted Correctly Statistic Register (ENET_IEEE_R_DROP)..... 1128
23.5.81 Frames Received OK Statistic Register (ENET_IEEE_R_FRAME_OK)..... 1128
23.5.82 Frames Received with CRC Error Statistic Register (ENET_IEEE_R_CRC)..... 1129
23.5.83 Frames Received with Alignment Error Statistic Register (ENET_IEEE_R_ALIGN)..... 1129

23.5.84 Receive FIFO Overflow Count Statistic Register (ENET_IEEE_R_MACERR)....1130
23.5.85 Flow Control Pause Frames Received Statistic Register (ENET_IEEE_R_FDXFC)....1130
23.5.86 Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK)....1131
23.5.87 Adjustable Timer Control Register (ENET_ATCR)....1131
23.5.88 Timer Value Register (ENET_ATVR)....1133
23.5.89 Timer Offset Register (ENET_ATOFF)....1133
23.5.90 Timer Period Register (ENET_ATPER)....1134
23.5.91 Timer Correction Register (ENET_ATCOR)....1134
23.5.92 Time-Stamping Clock Period Register (ENET_ATINC)....1135
23.5.93 Timestamp of Last Transmitted Frame (ENET_ATSTMP)....1135
23.5.94 Timer Global Status Register (ENET_TGSR)....1136
23.5.95 Timer Control Status Register (ENET_TCSR*n*)....1137
23.5.96 Timer Compare Capture Register (ENET_TCCR*n*)....1138
23.6 Functional description....1138
23.6.1 Ethernet MAC frame formats....1139
23.6.1.1 Pause Frames....1140
23.6.1.2 Magic packets....1141
23.6.2 IP and higher layers frame format....1142
23.6.2.1 Ethernet types....1142
23.6.2.2 IPv4 datagram format....1142
23.6.2.3 IPv6 datagram format....1143
23.6.2.4 Internet Control Message Protocol (ICMP) datagram format....1144
23.6.2.5 User Datagram Protocol (UDP) datagram format....1145
23.6.2.6 TCP datagram format....1145
23.6.3 IEEE 1588 message formats....1146
23.6.3.1 Transport encapsulation....1146
23.6.3.1.1 UDP/IP....1146
23.6.3.1.2 Native Ethernet (PTPv2)....1147
23.6.3.2 PTP header....1147

23.6.3.2.1 PTPv1 header ... 1148
23.6.3.2.2 PTPv2 header ... 1148
23.6.4 MAC receive ... 1150
23.6.4.1 Collision detection in half-duplex mode ... 1151
23.6.4.2 Preamble processing ... 1151
23.6.4.3 MAC address check ... 1152
23.6.4.3.1 Unicast address check ... 1152
23.6.4.3.2 Multicast and unicast address resolution ... 1152
23.6.4.3.3 Broadcast address reject ... 1153
23.6.4.3.4 Miss-bit implementation ... 1153
23.6.4.4 Frame length/type verification: payload length check ... 1154
23.6.4.5 Frame length/type verification: frame length check ... 1154
23.6.4.6 VLAN frames processing ... 1154
23.6.4.7 Pause frame termination ... 1154
23.6.4.8 CRC check ... 1155
23.6.4.9 Frame padding removal ... 1155
23.6.5 MAC transmit ... 1156
23.6.5.1 Frame payload padding ... 1157
23.6.5.2 MAC address insertion ... 1157
23.6.5.3 CRC-32 generation ... 1157
23.6.5.4 Inter-packet gap (IPG) ... 1158
23.6.5.5 Collision detection and handling — half-duplex operation only ... 1158
23.6.6 Full-duplex flow control operation ... 1160
23.6.6.1 Remote device congestion ... 1160
23.6.6.2 Local device/FIFO congestion ... 1161
23.6.7 Magic packet detection ... 1162
23.6.7.1 Sleep mode ... 1162
23.6.7.2 Magic packet detection ... 1162
23.6.7.3 Wakeup ... 1162

23.6.8 IP accelerator functions....1163
23.6.8.1 Checksum calculation....1163
23.6.8.2 Additional padding processing....1164
23.6.8.3 32-bit Ethernet payload alignment....1164
23.6.8.3.1 Receive processing....1165
23.6.8.3.2 Transmit processing....1165
23.6.8.4 Received frame discard....1165
23.6.8.5 IPv4 fragments....1166
23.6.8.6 IPv6 support....1166
23.6.8.6.1 Receive processing....1166
23.6.8.6.2 Transmit processing....1167
23.6.9 Resets and stop controls....1167
23.6.9.1 Hardware reset....1167
23.6.9.2 Soft reset....1167
23.6.9.3 Hardware freeze....1168
23.6.9.4 Graceful stop....1168
23.6.9.4.1 Graceful transmit stop (GTS)....1169
23.6.9.4.2 Graceful receive stop (GRS)....1169
23.6.9.4.3 Graceful stop interrupt (GRA)....1170
23.6.10 IEEE 1588 functions....1170
23.6.10.1 Adjustable timer module....1171
23.6.10.1.1 Adjustable timer implementation....1171
23.6.10.2 Transmit timestamping....1173
23.6.10.3 Receive timestamping....1173
23.6.10.4 Time synchronization....1173
23.6.10.5 Input Capture and Output Compare....1174
23.6.10.5.1 Input capture....1174
23.6.10.5.2 Output compare....1174
23.6.10.5.3 DMA requests....1174

23.6.11 FIFO thresholds....1174
23.6.11.1 Receive FIFO....1175
23.6.11.2 Transmit FIFO....1176
23.6.12 Loopback options....1177
23.6.13 Legacy buffer descriptors....1178
23.6.13.1 Legacy receive buffer descriptor....1178
23.6.13.2 Legacy transmit buffer descriptor....1178
23.6.14 Enhanced buffer descriptors....1179
23.6.14.1 Enhanced receive buffer descriptor....1179
23.6.14.2 Enhanced transmit buffer descriptor....1183
23.6.15 Client FIFO application interface....1185
23.6.15.1 Data structure description....1185
23.6.15.2 Data structure examples....1187
23.6.15.3 Frame status....1188
23.6.16 FIFO protection....1188
23.6.16.1 Transmit FIFO underflow....1188
23.6.16.2 Transmit FIFO overflow....1189
23.6.16.3 Receive FIFO overflow....1190
23.6.17 PHY management interface....1190
23.6.17.1 MDIO clause 22 frame format....1191
23.6.17.2 MDIO clause 45 frame format....1191
23.6.17.3 MDIO clock generation....1193
23.6.17.4 MDIO operation....1193
23.6.18 Ethernet interfaces....1193
23.6.18.1 RMII interface....1194
23.6.18.2 RGMII interface....1195
23.6.18.3 MII Interface — transmit....1196
23.6.18.3.1 Transmit with collision — half-duplex....1197
23.6.18.4 MII interface — receive....1197

Chapter 24
Electrophoretic Display Controller (EPDC)

24.1 Overview 1199

24.1.1 EPDC Block Diagram 1200

24.2 External Signals 1201

24.3 Programming Model 1203

24.3.1 Assumptions 1203

24.3.2 Register Space (Write/Set/Clear/Toggle) 1204

24.3.3 Interrupts 1205

24.3.3.1 Interrupt Sources 1205

24.3.3.2 Enabling/Masking Interrupts 1205

24.3.3.3 Handling/Clearing Interrupts 1205

24.3.4 Controller Setup 1206

24.3.4.1 Memory Requirements 1206

24.3.4.2 Panel Architecture Configuration 1207

24.3.4.3 TFT Panel Timing Configuration 1210

24.3.4.4 Source Driver and Pixel Clock Configuration 1215

24.3.4.5 Initializing the Display 1216

24.3.4.5.1 Reset/Clocks and Buffer Preparation 1217

24.3.4.5.2 Performing an Initialization Display Update 1217

24.3.5 Dual-Scan Configuration 1218

24.3.6 Update Buffer Analysis Functions 1221

24.3.7 Waveform Mode Selection (AUTOWV) 1222

24.3.8 Panel Interface Generator (Pigeon Mode) 1222

24.3.9 Display Update Programming 1226

24.3.9.1 Initiating a Display Update 1226

24.3.9.2 Update Processing and Collisions 1227

24.3.9.3 Multiple Update Flow 1231

24.3.10 Architectural Clock Gating (Low Power Mode) 1234

24.3.11 Performance Tuning and Considerations....1236
24.3.11.1 Memory and Bus Bandwidth Requirements....1236
24.3.11.2 Pixel Latency FIFO....1237
24.3.11.3 Basic Watermarking Control....1237
24.3.11.4 Update/Refresh Tuning (VSCAN_HOLDOFF)....1238
24.3.11.5 System-Level Arbitration Control....1238
24.4 EPDC Memory Map/Register Definition....1240
24.4.1 EPDC Control Register (EPDC_CTRL*n*)....1249
24.4.2 EPDC Waveform Address Pointer (EPDC_WVADDR)....1250
24.4.3 EPDC Working Buffer Address (EPDC_WB_ADDR)....1251
24.4.4 EPDC Screen Resolution (EPDC_RES)....1252
24.4.5 EPDC Format Control Register (EPDC_FORMAT*n*)....1252
24.4.6 EPDC FIFO control register (EPDC_FIFOCTRL*n*)....1254
24.4.7 EPDC Update Region Address (EPDC_UPD_ADDR)....1255
24.4.8 EPDC Update Region Stride (EPDC_UPD_STRIDE)....1256
24.4.9 EPDC Update Command Co-ordinate (EPDC_UPD_CORD)....1257
24.4.10 EPDC Update Command Size (EPDC_UPD_SIZE)....1257
24.4.11 EPDC Update Command Control (EPDC_UPD_CTRL*n*)....1258
24.4.12 EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED*n*)....1259
24.4.13 EPDC Temperature Register (EPDC_TEMP)....1260
24.4.14 Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT)....1261
24.4.15 EPDC Timing Control Engine Control Register (EPDC_TCE_CTRL*n*)....1261
24.4.16 EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFG*n*)....1263
24.4.17 EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFG*n*)....1265
24.4.18 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1*n*)....1266
24.4.19 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2*n*)....1266
24.4.20 EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCAN*n*)....1267
24.4.21 EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OE*n*)....1268
24.4.22 EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITY)....1268

24.4.23 EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1*n*)..... 1269
24.4.24 EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2*n*)..... 1271
24.4.25 EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3*n*)..... 1271
24.4.26 EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0*n*).....1272
24.4.27 EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1*n*).....1272
24.4.28 EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1*n*)..... 1273
24.4.29 EPDC IRQ Mask Register for LUT 32~63 (EPDC_IRQ_MASK2*n*)..... 1273
24.4.30 EPDC Interrupt Register for LUT 0~31 (EPDC_IRQ1*n*).....1274
24.4.31 EPDC Interrupt Registerr for LUT 32~63 (EPDC_IRQ2*n*)..... 1274
24.4.32 EPDC IRQ Mask Register (EPDC_IRQ_MASK*n*)..... 1275
24.4.33 EPDC Interrupt Register (EPDC_IRQ*n*)..... 1276
24.4.34 EPDC Status Register - LUTs (EPDC_STATUS_LUTS1*n*).....1278
24.4.35 EPDC Status Register - LUTs (EPDC_STATUS_LUTS2*n*).....1278
24.4.36 EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT)..... 1278
24.4.37 EPDC LUT Collision Status (EPDC_STATUS_COL1*n*)..... 1280
24.4.38 EPDC LUT Collision Status (EPDC_STATUS_COL2*n*)..... 1280
24.4.39 EPDC General Status Register (EPDC_STATUS*n*).....1281
24.4.40 EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD)..... 1283
24.4.41 EPDC Collision Region Size (EPDC_UPD_COL_SIZE)..... 1283
24.4.42 1-level Histogram Parameter Register. (EPDC_HIST1_PARAM)..... 1284
24.4.43 2-level Histogram Parameter Register. (EPDC_HIST2_PARAM)..... 1285
24.4.44 4-level Histogram Parameter Register. (EPDC_HIST4_PARAM)..... 1285
24.4.45 8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0)..... 1286
24.4.46 8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1)..... 1287
24.4.47 16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0)..... 1288
24.4.48 16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1)..... 1288
24.4.49 16-level Histogram Parameter Register. (EPDC_HIST16_PARAM2)..... 1289
24.4.50 16-level Histogram Parameter Register. (EPDC_HIST16_PARAM3)..... 1290
24.4.51 EPDC General Purpose I/O Debug register (EPDC_GPIO*n*).....1291

24.4.52 EPDC Version Register (EPDC_VERSION)..... 1292
24.4.53 Panel Interface Signal Generator Register 0_0 (EPDC_PIGEON_0_0).....1292
24.4.54 Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_1).....1294
24.4.55 Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_2).....1294
24.4.56 Panel Interface Signal Generator Register 1_0 (EPDC_PIGEON_1_0).....1295
24.4.57 Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_1).....1296
24.4.58 Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_2).....1297
24.4.59 Panel Interface Signal Generator Register 2_0 (EPDC_PIGEON_2_0).....1297
24.4.60 Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_1).....1298
24.4.61 Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_2).....1299
24.4.62 Panel Interface Signal Generator Register 3_0 (EPDC_PIGEON_3_0).....1300
24.4.63 Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_1).....1301
24.4.64 Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_2).....1301
24.4.65 Panel Interface Signal Generator Register 4_0 (EPDC_PIGEON_4_0).....1302
24.4.66 Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_1).....1303
24.4.67 Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_2).....1304
24.4.68 Panel Interface Signal Generator Register 5_0 (EPDC_PIGEON_5_0).....1304
24.4.69 Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_1).....1306
24.4.70 Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_2).....1306
24.4.71 Panel Interface Signal Generator Register 6_0 (EPDC_PIGEON_6_0).....1307
24.4.72 Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_1).....1308
24.4.73 Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_2).....1309
24.4.74 Panel Interface Signal Generator Register 7_0 (EPDC_PIGEON_7_0).....1309
24.4.75 Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_1).....1310
24.4.76 Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_2).....1311
24.4.77 Panel Interface Signal Generator Register 8_0 (EPDC_PIGEON_8_0).....1312
24.4.78 Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_1).....1313
24.4.79 Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_2).....1313
24.4.80 Panel Interface Signal Generator Register 9_0 (EPDC_PIGEON_9_0).....1314

24.4.81 Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_1)....1315
24.4.82 Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_2)....1316
24.4.83 Panel Interface Signal Generator Register 10_0 (EPDC_PIGEON_10_0).... 1316
24.4.84 Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_1).... 1318
24.4.85 Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_2).... 1318
24.4.86 Panel Interface Signal Generator Register 11_0 (EPDC_PIGEON_11_0).... 1319
24.4.87 Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_1).... 1320
24.4.88 Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_2).... 1321
24.4.89 Panel Interface Signal Generator Register 12_0 (EPDC_PIGEON_12_0).... 1321
24.4.90 Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_1).... 1322
24.4.91 Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_2).... 1323
24.4.92 Panel Interface Signal Generator Register 13_0 (EPDC_PIGEON_13_0).... 1324
24.4.93 Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_1).... 1325
24.4.94 Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_2).... 1325
24.4.95 Panel Interface Signal Generator Register 14_0 (EPDC_PIGEON_14_0).... 1326
24.4.96 Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_1).... 1327
24.4.97 Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_2).... 1328
24.4.98 Panel Interface Signal Generator Register 15_0 (EPDC_PIGEON_15_0).... 1328
24.4.99 Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_1).... 1330
24.4.100 Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_2).... 1330
24.4.101 Panel Interface Signal Generator Register 16_0 (EPDC_PIGEON_16_0).... 1331
24.4.102 Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_1).... 1332
24.4.103 Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_2).... 1333

Chapter 25
Enhanced Periodic Interrupt Timer (EPIT)

25.1 Overview....1335
25.1.1 EPIT features....1335
25.1.2 EPIT modes and operations.... 1336
25.2 External signals....1336

25.3 Clocks ... 1336
25.4 Functional Description ... 1338
25.4.1 Operating modes ... 1338
25.4.1.1 Operating in set-and-forget mode ... 1338
25.4.1.2 Operating in free-running mode ... 1338
25.4.2 Operations ... 1339
25.4.3 Compare Event ... 1339
25.4.3.1 Counter Value Overwrite ... 1340
25.4.3.2 Low-Power Mode Behavior ... 1341
25.4.3.3 Debug Mode Behavior ... 1341
25.5 Initialization/ Application Information ... 1341
25.5.1 Change of Clock Source ... 1341
25.6 EPIT Memory Map/Register Definition ... 1342
25.6.1 Control register (EPIT*x*_CR) ... 1342
25.6.2 Status register (EPIT*x*_SR) ... 1345
25.6.3 Load register (EPIT*x*_LR) ... 1345
25.6.4 Compare register (EPIT*x*_CMPR) ... 1346
25.6.5 Counter register (EPIT*x*_CNR) ... 1346

Chapter 26
Enhanced Serial Audio Interface (ESAI)

26.1 Overview ... 1347
26.1.1 Features ... 1349
26.1.2 Modes of Operation ... 1349
26.1.2.1 Normal/Network/On-Demand Mode Selection ... 1349
26.1.2.2 Synchronous/Asynchronous Operating Modes ... 1350
26.1.2.3 Frame Sync Selection ... 1350
26.1.2.4 Shift Direction Selection ... 1351
26.2 External Signals ... 1352
26.2.1 Serial Transmit 0 Data Pin ... 1353

26.2.2 Serial Transmit 1 Data Pin ... 1353
26.2.3 Serial Transmit 2/Receive 3 Data Pin ... 1354
26.2.4 Serial Transmit 3/Receive 2 Data Pin ... 1354
26.2.5 Serial Transmit 4/Receive 1 Data Pin ... 1355
26.2.6 Serial Transmit 5/Receive 0 Data Pin ... 1355
26.2.7 Receiver Serial Clock ... 1356
26.2.8 Transmitter Serial Clock ... 1357
26.2.9 Frame Sync for Receiver ... 1358
26.2.10 Frame Sync for Transmitter ... 1359
26.2.11 High Frequency Clock for Transmitter ... 1359
26.2.12 High Frequency Clock for Receiver ... 1360
26.2.13 Serial I/O Flags ... 1360
26.3 Clocks ... 1361
26.4 Functional Description ... 1362
26.4.1 ESAI After Reset ... 1362
26.4.2 ESAI Interrupt Requests ... 1362
26.4.3 ESAI DMA Requests from the FIFOs ... 1363
26.4.4 ESAI Transmit and Receive Shift Registers ... 1364
26.4.4.1 ESAI Transmit Shift Registers ... 1364
26.4.4.2 ESAI Receive Shift Registers ... 1367
26.5 Initialization Information ... 1367
26.5.1 ESAI Initialization ... 1367
26.5.2 ESAI Initialization Examples ... 1368
26.5.2.1 Initializing the ESAI using Personal Reset ... 1368
26.5.2.2 Initializing the ESAI Transmitter Section ... 1369
26.5.2.3 Initializing the ESAI Receiver Section ... 1369
26.6 ESAI Memory Map/Register Definition ... 1370
26.6.1 ESAI Transmit Data Register (ESAI_ETDR) ... 1372
26.6.2 ESAI Receive Data Register (ESAI_ERDR) ... 1372

26.6.3 ESAI Control Register (ESAI_ECR)....1373
26.6.4 ESAI Status Register (ESAI_ESR)....1374
26.6.5 Transmit FIFO Configuration Register (ESAI_TFCR)....1376
26.6.6 Transmit FIFO Status Register (ESAI_TFSR)....1378
26.6.7 Receive FIFO Configuration Register (ESAI_RFCR)....1379
26.6.8 Receive FIFO Status Register (ESAI_RFSR)....1381
26.6.9 Transmit Data Register n (ESAI_TX*n*)....1382
26.6.10 ESAI Transmit Slot Register (ESAI_TSR)....1382
26.6.11 Receive Data Register n (ESAI_RX*n*)....1383
26.6.12 Serial Audio Interface Status Register (ESAI_SAISR)....1384
26.6.13 Serial Audio Interface Control Register (ESAI_SAICR)....1386
26.6.14 Transmit Control Register (ESAI_TCR)....1389
26.6.15 Transmit Clock Control Register (ESAI_TCCR)....1397
26.6.16 Receive Control Register (ESAI_RCR)....1401
26.6.17 Receive Clock Control Register (ESAI_RCCR)....1405
26.6.18 Transmit Slot Mask Register A (ESAI_TSMA)....1408
26.6.19 Transmit Slot Mask Register B (ESAI_TSMB)....1409
26.6.20 Receive Slot Mask Register A (ESAI_RSMA)....1410
26.6.21 Receive Slot Mask Register B (ESAI_RSMB)....1411
26.6.22 Port C Direction Register (ESAI_PRRC)....1412
26.6.23 Port C Control Register (ESAI_PCRC)....1412

Chapter 27
Flexible Controller Area Network (FLEXCAN)

27.1 Overview....1415
27.1.1 Block Diagram....1415
27.1.2 FLEXCAN Module Features....1417
27.1.3 Modes of Operation....1418
27.2 External Signals....1419
27.3 Clocks....1420

27.4 Message Buffer Structure 1420
27.5 Rx FIFO Structure 1424
27.6 Functional Description 1428
27.6.1 Functional Overview 1428
27.6.2 Transmit Process 1428
27.6.3 Arbitration process 1429
27.6.3.1 Lowest Mailbox number first 1430
27.6.3.2 Highest Mailbox priority first 1430
27.6.3.2.1 Local Priority disabled 1430
27.6.3.2.2 Local Priority enabled 1431
27.6.4 Receive Process 1432
27.6.5 Matching Process 1434
27.6.6 Move Process 1438
27.6.6.1 Move-in 1439
27.6.6.2 Move-out 1440
27.6.7 Data Coherence 1440
27.6.7.1 Transmission Abort Mechanism 1440
27.6.7.2 Message Buffer Inactivation 1441
27.6.7.3 Message Buffer Lock Mechanism 1442
27.6.8 Rx FIFO 1443
27.6.9 CAN Protocol Related Features 1445
27.6.9.1 Remote Frames 1445
27.6.9.2 Overload Frames 1446
27.6.9.3 Time Stamp 1446
27.6.9.4 Protocol Timing 1446
27.6.9.5 Arbitration and Matching Timing 1449
27.6.10 Modes of Operation Details 1451
27.6.10.1 Freeze Mode 1451
27.6.10.2 Module Disable Mode 1452

27.6.10.3 Stop Mode ... 1453
27.6.11 Interrupts ... 1454
27.7 Initialization/Application Information ... 1454
27.7.1 FLEXCAN Initialization Sequence ... 1455
27.8 FLEXCAN Memory Map/Register Definition ... 1456
27.8.1 Module Configuration Register (FLEXCAN*x*_MCR) ... 1463
27.8.2 Control 1 Register (FLEXCAN*x*_CTRL1) ... 1468
27.8.3 Free Running Timer Register (FLEXCAN*x*_TIMER) ... 1471
27.8.4 Rx Mailboxes Global Mask Register (FLEXCAN*x*_RXMGMASK) ... 1471
27.8.5 Rx Buffer 14 Mask Register (FLEXCAN*x*_RX14MASK) ... 1472
27.8.6 Rx Buffer 15 Mask Register (FLEXCAN*x*_RX15MASK) ... 1473
27.8.7 Error Counter Register (FLEXCAN*x*_ECR) ... 1474
27.8.8 Error and Status 1 Register (FLEXCAN*x*_ESR1) ... 1475
27.8.9 Interrupt Masks 2 Register (FLEXCAN*x*_IMASK2) ... 1479
27.8.10 Interrupt Masks 1 Register (FLEXCAN*x*_IMASK1) ... 1479
27.8.11 Interrupt Flags 2 Register (FLEXCAN*x*_IFLAG2) ... 1480
27.8.12 Interrupt Flags 1 Register (FLEXCAN*x*_IFLAG1) ... 1480
27.8.13 Control 2 Register (FLEXCAN*x*_CTRL2) ... 1482
27.8.14 Error and Status 2 Register (FLEXCAN*x*_ESR2) ... 1488
27.8.15 CRC Register (FLEXCAN*x*_CRCR) ... 1490
27.8.16 Rx FIFO Global Mask Register (FLEXCAN*x*_RXFGMASK) ... 1491
27.8.17 Rx FIFO Information Register (FLEXCAN*x*_RXFIR) ... 1492
27.8.18 Rx Individual Mask Registers (FLEXCAN*x*_RXIMR*n*) ... 1493
27.8.19 Glitch Filter Width Registers (FLEXCAN*x*_GFWR) ... 1493

Chapter 28
General Power Controller (GPC)

28.1 Overview ... 1495
28.2 Clocks ... 1496
28.3 Power Gating Control (PGC) ... 1496

28.3.1 Overview ... 1497
28.3.1.1 Features ... 1498
28.4 GPC Interrupt Controller (INTC) ... 1498
28.4.1 Interrupt Controller features ... 1498
28.5 GPC Memory Map/Register Definition ... 1499
28.5.1 GPC Interface control register (GPC_CNTR) ... 1499
28.5.2 IRQ masking register 1 (GPC_IMR1) ... 1501
28.5.3 IRQ masking register 2 (GPC_IMR2) ... 1501
28.5.4 IRQ masking register 3 (GPC_IMR3) ... 1501
28.5.5 IRQ masking register 4 (GPC_IMR4) ... 1502
28.5.6 IRQ status resister 1 (GPC_ISR1) ... 1502
28.5.7 IRQ status resister 2 (GPC_ISR2) ... 1503
28.5.8 IRQ status resister 3 (GPC_ISR3) ... 1503
28.5.9 IRQ status resister 4 (GPC_ISR4) ... 1504
28.6 PGC Memory Map/Register Definition ... 1504
28.6.1 PGC GPU PGC Control Register (PGC_GPU_CTRL) ... 1505
28.6.2 PGC GPU Power Up Sequence Control Register (PGC_GPU_PUPSCR) ... 1506
28.6.3 PGC GPU Pull Down Sequence Control Register (PGC_GPU_PDNSCR) ... 1506
28.6.4 PGC GPU Power Gating Controller Status Register (PGC_GPU_SR) ... 1507
28.6.5 PGC CPU Control Register (PGC_CPU_CTRL) ... 1508
28.6.6 PGC CPU Power Up Sequence Control Register (PGC_CPU_PUPSCR) ... 1508
28.6.7 PGC CPU Pull Down Sequence Control Register (PGC_CPU_PDNSCR) ... 1509
28.6.8 PGC CPU Power Gating Controller Status Register (PGC_CPU_SR) ... 1510

Chapter 29
General Purpose Input/Output (GPIO)

29.1 Overview ... 1511
29.1.1 Block Diagram ... 1513
29.1.2 Features ... 1514
29.2 External Signals ... 1514

29.3 Clocks ... 1520
29.4 GPIO Functional Description ... 1521
29.4.1 GPIO Function ... 1521
29.4.2 GPIO pad structure ... 1521
29.4.2.1 Input Driver ... 1522
29.4.2.1.1 Schmitt trigger ... 1522
29.4.2.1.2 Input keeper ... 1523
29.4.2.2 Output driver ... 1523
29.4.2.2.1 Drive strength ... 1524
29.4.2.2.2 Output keeper ... 1524
29.4.2.2.3 PU / PD / Keeper Logic ... 1525
29.4.2.2.4 Open drain ... 1525
29.4.2.3 Operating Frequency ... 1526
29.4.3 GPIO Programming ... 1528
29.4.3.1 GPIO Read Mode ... 1528
29.4.3.2 GPIO Write Mode ... 1528
29.4.4 Interrupt Control Unit ... 1529
29.5 GPIO Memory Map/Register Definition ... 1529
29.5.1 GPIO data register (GPIO*x*_DR) ... 1531
29.5.2 GPIO direction register (GPIO*x*_GDIR) ... 1532
29.5.3 GPIO pad status register (GPIO*x*_PSR) ... 1533
29.5.4 GPIO interrupt configuration register1 (GPIO*x*_ICR1) ... 1533
29.5.5 GPIO interrupt configuration register2 (GPIO*x*_ICR2) ... 1537
29.5.6 GPIO interrupt mask register (GPIO*x*_IMR) ... 1540
29.5.7 GPIO interrupt status register (GPIO*x*_ISR) ... 1541
29.5.8 GPIO edge select register (GPIO*x*_EDGE_SEL) ... 1542

Chapter 30
General Purpose Media Interface (GPMI)

30.1 Overview ... 1543

30.2 External Signals.... 1544
30.3 Clocks.... 1545
30.4 GPMI NAND Mode.... 1546
30.4.1 Multiple NAND Support.... 1546
30.4.2 GPMI NAND Timing and Clocking.... 1547
30.4.3 Basic NAND Timing.... 1547
30.4.3.1 NAND Asynchronous Timing.... 1547
30.4.3.2 NAND Asynchronous EDO Mode Timing.... 1549
30.4.3.3 NAND ONFI Source Synchronous Mode Timing.... 1552
30.4.3.4 NAND Toggle Mode Timing.... 1557
30.4.4 Hardware BCH Interface.... 1565
30.5 Behavior During Reset.... 1566
30.6 GPMI Memory Map/Register Definition.... 1566
30.6.1 GPMI Control Register 0 Description (GPMI_CTRL0*n*).... 1568
30.6.2 GPMI Compare Register Description (GPMI_COMPARE).... 1570
30.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRL*n*).... 1571
30.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT).... 1572
30.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD).... 1572
30.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY).... 1573
30.6.7 GPMI Control Register 1 Description (GPMI_CTRL1*n*).... 1574
30.6.8 GPMI Timing Register 0 Description (GPMI_TIMING0).... 1577
30.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1).... 1577
30.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2).... 1578
30.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA).... 1579
30.6.12 GPMI Status Register Description (GPMI_STAT).... 1579
30.6.13 GPMI Debug Information Register Description (GPMI_DEBUG).... 1582
30.6.14 GPMI Version Register Description (GPMI_VERSION).... 1583
30.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2).... 1583
30.6.16 GPMI Debug3 Information Register Description (GPMI_DEBUG3).... 1586

30.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)..... 1587
30.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL).....1588
30.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)..... 1590
30.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)..... 1591

Chapter 31
General Purpose Timer (GPT)

31.1 Overview.....1595
31.1.1 Features..... 1597
31.1.2 Modes and Operation..... 1597
31.2 External Signals..... 1597
31.2.1 External Clock Input 1598
31.2.2 Input Capture Trigger Signals 1598
31.2.3 Output Compare Signals..... 1599
31.3 Clocks..... 1599
31.4 Functional Description.....1601
31.4.1 Operating Modes.....1601
31.4.1.1 Restart Mode..... 1601
31.4.1.2 Free-Run Mode..... 1601
31.4.2 Operation.....1602
31.4.2.1 Input Capture.....1602
31.4.2.2 Output Compare..... 1603
31.4.2.3 Interrupts..... 1604
31.4.2.4 Low Power Mode Behavior..... 1605
31.4.2.5 Debug Mode Behavior..... 1605
31.5 Initialization/ Application Information 1605
31.5.1 Selecting the Clock Source 1605
31.6 GPT Memory Map/Register Definition.....1606
31.6.1 GPT Control Register (GPT_CR)..... 1607
31.6.2 GPT Prescaler Register (GPT_PR)..... 1611

31.6.3 GPT Status Register (GPT_SR)....1612
31.6.4 GPT Interrupt Register (GPT_IR)....1613
31.6.5 GPT Output Compare Register 1 (GPT_OCR1)....1614
31.6.6 GPT Output Compare Register 2 (GPT_OCR2)....1615
31.6.7 GPT Output Compare Register 3 (GPT_OCR3)....1615
31.6.8 GPT Input Capture Register 1 (GPT_ICR1)....1616
31.6.9 GPT Input Capture Register 2 (GPT_ICR2)....1616
31.6.10 GPT Counter Register (GPT_CNT)....1617

Chapter 32
2D Graphics Processing Unit (GPU2D)

32.1 Overview....1619
32.2 GPU2D Block Diagram....1619
32.2.1 R2D GPU....1619
32.3 GPU2D Features....1620
32.3.1 Full Featured R2D GPU Pipeline....1620
32.4 GPU2D OPERATIONS....1621
32.4.1 R2D GPU Operations....1621
32.4.1.1 Line....1621
32.4.1.2 Rectangle Fill and Clear....1621
32.4.1.3 BitBLT....1622
32.4.1.4 Stretch BLT....1623
32.4.1.5 Monochrome Expansion and Mask BLT....1623
32.4.1.5.1 Monochrome expansion....1623
32.4.1.5.2 Mask BLT....1623
32.4.1.6 Filter BLT....1624
32.4.1.7 R2D Performance of different operations....1625
32.4.1.8 Rotation....1626
32.4.1.9 Transparency Mode....1626
32.4.1.10 Clipping....1626

32.4.1.11 R2D GPU Data Formats.... 1626
32.4.1.12 ARGB Data Conversion of R2D GPU.... 1627
32.4.1.13 YUV to RGB Conversion of R2D GPU.... 1627
32.4.1.14 Color Index Input Conversion Support of R2D GPU.... 1628
32.4.1.15 Source/Destination Pre-multiply and De-Multiply Support.... 1628
32.4.1.16 Alpha Blending.... 1628
32.4.1.17 GPU Cache Management.... 1630

Chapter 33
3D Graphics Processing Unit (GPU3D)

33.1 Overview.... 1631
33.2 GPU3D Block Diagram.... 1631
33.3 GPU3D Hardware Features.... 1633
33.3.1 Rasterization.... 1636
33.3.2 Fragment Processing.... 1636
33.3.3 Dest/Alpha Blending.... 1638
33.3.4 Z/Stencil Buffer.... 1638
33.3.5 Render Target.... 1638
33.4 Usage Mode.... 1639

Chapter 34
HDMI Transmitter (HDMI)

34.1 Overview.... 1641
34.1.1 HDMI Operational Model Overview.... 1641
34.1.1.1 Interfaces.... 1643
34.1.1.2 Features.... 1644
34.2 External Signals.... 1645
34.3 Clocks.... 1645
34.4 Functional Description.... 1646
34.4.1 HDMI TX Functional Overview.... 1646
34.4.2 Video Pixel Sampler.... 1647

34.4.2.1 HDMI Transmitter Controller Databook Functional Description....1648
34.4.3 Supported Video Mode....1650
34.4.4 Video Packetizer....1653
34.4.5 Color Space Conversion....1654
34.4.6 Audio Interfaces....1655
34.4.6.1 CTS Calculation....1656
34.4.6.2 Audio DMA Interface....1656
34.4.6.2.1 AHB Master....1657
34.4.6.2.2 DMA Engine....1659
34.4.6.2.2.1 Functional Behavior....1659
34.4.6.2.2.2 DMA Operation....1660
34.4.6.2.2.3 Transfer Data, Package, and Word....1662
34.4.6.2.3 Audio FIFO....1664
34.4.6.2.4 FIFO Occupancy/FIFO Almost Empty Flags....1664
34.4.7 Supported Audio Formats....1665
34.4.8 Frame Composer....1665
34.4.9 HDCP Encryption Engine....1667
34.4.10 EDID/HDCP I2C E-DDC Interface....1668
34.4.10.1 I2C Master Interface Normal Mode....1669
34.4.10.2 I2C Master Interface Extended Read Mode....1669
34.4.11 System Configuration Interfaces....1670
34.4.11.1 AMBA AHB Slave Interface....1670
34.4.12 CEC Hardware Engine....1670
34.5 HDMI Memory Map/Register Definition....1672
34.5.1 Design Identification Register (HDMI_DESIGN_ID)....1688
34.5.2 Revision Identification Register (HDMI_REVISION_ID)....1689
34.5.3 Product Identification Register 0 (HDMI_PRODUCT_ID0)....1690
34.5.4 Product Identification Register 1 (HDMI_PRODUCT_ID1)....1690
34.5.5 Configuration Identification Register 0 (HDMI_CONFIG0_ID)....1691

34.5.6 Configuration Identification Register 1 (HDMI_CONFIG1_ID)..... 1692
34.5.7 Configuration Identification Register 2 (HDMI_CONFIG2_ID)..... 1693
34.5.8 Configuration Identification Register 3 (HDMI_CONFIG3_ID)..... 1693
34.5.9 Frame Composer Interrupt Status Register 0 (HDMI_IH_FC_STAT0)..... 1694
34.5.10 Frame Composer Interrupt Status Register 1 (HDMI_IH_FC_STAT1)..... 1695
34.5.11 Frame Composer Interrupt Status Register 2 (HDMI_IH_FC_STAT2)..... 1696
34.5.12 Audio Sampler Interrupt Status Register (HDMI_IH_AS_STAT0)..... 1697
34.5.13 PHY Interface Interrupt Status Register (HDMI_IH_PHY_STAT0)..... 1698
34.5.14 E-DDC I2C Master Interrupt Status Register (HDMI_IH_I2CM_STAT0)..... 1699
34.5.15 CEC Interrupt Status Register (HDMI_IH_CEC_STAT0)..... 1700
34.5.16 Video Packetizer Interrupt Status Register (HDMI_IH_VP_STAT0)..... 1701
34.5.17 PHY GEN2 I2C Master Interrupt Status Register (HDMI_IH_I2CMPHY_STAT0)..... 1702
34.5.18 AHB Audio DMA Interrupt Status Register (HDMI_IH_AHBDMAAUD_STAT0)..... 1702
34.5.19 Frame Composer Interrupt Mute Control Register 0 (HDMI_IH_MUTE_FC_STAT0)..... 1704
34.5.20 Frame Composer Interrupt Mute Control Register 1 (HDMI_IH_MUTE_FC_STAT1)..... 1705
34.5.21 Frame Composer Interrupt Mute Control Register 2 (HDMI_IH_MUTE_FC_STAT2)..... 1706
34.5.22 Audio Sampler Interrupt Mute Control Register 0 (HDMI_IH_MUTE_AS_STAT0)..... 1706
34.5.23 PHY Interface Interrupt Mute Control Register (HDMI_IH_MUTE_PHY_STAT0)..... 1707
34.5.24 E-DDC I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CM_STAT0)..... 1708
34.5.25 CEC Interrupt Mute Control Register (HDMI_IH_MUTE_CEC_STAT0)..... 1708
34.5.26 Video Packetizer Interrupt Mute Control Register (HDMI_IH_MUTE_VP_STAT0)..... 1709
34.5.27 PHY GEN 2 I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CMPHY_STAT0)..... 1710
34.5.28 AHB Audio DMA Interrupt Mute Control Register (HDMI_IH_MUTE_AHBDMAAUD_STAT0)..... 1711
34.5.29 Global Interrupt Mute Control Register (HDMI_IH_MUTE)..... 1712
34.5.30 Video Input Mapping and Internal Data Enable Configuration Register (HDMI_TX_INVID0)..... 1712
34.5.31 Video Input Stuffing Enable Register (HDMI_TX_INSTUFFING)..... 1713
34.5.32 Video Input GY Data Channel Stuffing Register 0 (HDMI_TX_GYDATA0)..... 1714
34.5.33 Video Input GY Data Channel Stuffing Register 1 (HDMI_TX_GYDATA1)..... 1715
34.5.34 Video Input RCR Data Channel Stuffing Register 0 (HDMI_TX_RCRDATA0)..... 1715

34.5.35 Video Input RCR Data Channel Stuffing Register 1 (HDMI_TX_RCRDATA1)..... 1716
34.5.36 Video Input RCB Data Channel Stuffing Register 0 (HDMI_TX_BCBDATA0)..... 1716
34.5.37 Video Input RCB Data Channel Stuffing Register 1 (HDMI_TX_BCBDATA1)..... 1717
34.5.38 Video Packetizer Packing Phase Status Register (HDMI_VP_STATUS)..... 1717
34.5.39 Video Packetizer Pixel Repetition and Color Depth Register (HDMI_VP_PR_CD)..... 1718
34.5.40 Video Packetizer Stuffing and Default Packing Phase Register (HDMI_VP_STUFF)..... 1719
34.5.41 Video Packetizer YCC422 Remapping Register (HDMI_VP_REMAP)..... 1720
34.5.42 Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI_VP_CONF)..... 1721
34.5.43 Video Packetizer Interrupt Mask Register (HDMI_VP_MASK)..... 1721
34.5.44 Frame Composer Input Video Configuration and HDCP Keepout Register (HDMI_FC_INVIDCONF) 1722
34.5.45 Frame Composer Input Video HActive Pixels Register 0 (HDMI_FC_INHACTIV0)..... 1724
34.5.46 Frame Composer Input Video HActive Pixels Register 1 (HDMI_FC_INHACTIV1)..... 1724
34.5.47 Frame Composer Input Video HBlank Pixels Register 0 (HDMI_FC_INHBLANK0)..... 1725
34.5.48 Frame Composer Input Video HBlank Pixels Register 1 (HDMI_FC_INHBLANK1)..... 1725
34.5.49 Frame Composer Input Video VActive Pixels Register 0 (HDMI_FC_INVACTIV0)..... 1726
34.5.50 Frame Composer Input Video VActive Pixels Register 1 (HDMI_FC_INVACTIV1)..... 1727
34.5.51 Frame Composer Input Video VBlank Pixels Register (HDMI_FC_INVBLANK)..... 1727
34.5.52 Frame Composer Input Video HSync Front Porch Register 0 (HDMI_FC_HSYNCINDELAY0)..... 1728
34.5.53 Frame Composer Input Video HSync Front Porch Register 1 (HDMI_FC_HSYNCINDELAY1)..... 1728
34.5.54 Frame Composer Input Video HSync Width Register 0 (HDMI_FC_HSYNCINWIDTH0)..... 1729
34.5.55 Frame Composer Input Video HSync Width Register 1 (HDMI_FC_HSYNCINWIDTH1)..... 1730
34.5.56 Frame Composer Input Video VSync Front Porch Register (HDMI_FC_VSYNCINDELAY)..... 1730
34.5.57 Frame Composer Input Video VSync Width Register (HDMI_FC_VSYNCINWIDTH)..... 1731
34.5.58 Frame Composer Input Video Refresh Rate Register 0 (HDMI_FC_INFREQ0)..... 1731
34.5.59 Frame Composer Input Video Refresh Rate Register 1 (HDMI_FC_INFREQ1)..... 1732
34.5.60 Frame Composer Input Video Refresh Rate Register 2 (HDMI_FC_INFREQ2)..... 1732
34.5.61 Frame Composer Control Period Duration Register (HDMI_FC_CTRLDUR)..... 1733
34.5.62 Frame Composer Extended Control Period Duration Register (HDMI_FC_EXCTRLDUR)..... 1734
34.5.63 Frame Composer Extended Control Period Maximum Spacing Register (HDMI_FC_EXCTRLSPAC).1734

34.5.64 Frame Composer Channel 0 Non-Preamble Data Register (HDMI_FC_CH0PREAM)..... 1735
34.5.65 Frame Composer Channel 1 Non-Preamble Data Register (HDMI_FC_CH1PREAM)..... 1735
34.5.66 Frame Composer Channel 2 Non-Preamble Data Register (HDMI_FC_CH2PREAM)..... 1736
34.5.67 Frame Composer AVI Configuration Register 3 (HDMI_FC_AVICONF3)..... 1736
34.5.68 Frame Composer GCP Packet Configuration Register (HDMI_FC_GCP)..... 1737
34.5.69 Frame Composer AVI Packet Configuration Register 0 (HDMI_FC_AVICONF0)..... 1737
34.5.70 Frame Composer AVI Packet Configuration Register 1 (HDMI_FC_AVICONF1)..... 1739
34.5.71 FC_AVICONFFrame Composer AVI Packet Configuration Register 2 (HDMI_FC_AVICONF2)..... 1739
34.5.72 Frame Composer AVI Packet VIC Register (HDMI_FC_AVIVID)..... 1740
34.5.73 Frame Composer AVI Packet End of Top Bar Register 0 (HDMI_FC_AVIETB0)..... 1740
34.5.74 Frame Composer AVI Packet End of Top Bar Register 1 (HDMI_FC_AVIETB1)..... 1741
34.5.75 Frame Composer AVI Packet Start of Bottom Bar Register 0 (HDMI_FC_AVISBB0)..... 1741
34.5.76 Frame Composer AVI Packet Start of Bottom Bar Register 1 (HDMI_FC_AVISBB1)..... 1742
34.5.77 Frame Composer AVI Packet End of Left Bar Register 0 (HDMI_FC_AVIELB0)..... 1742
34.5.78 Frame Composer AVI Packet End of Left Bar Register 1 (HDMI_FC_AVIELB1)..... 1743
34.5.79 Frame Composer AVI Packet Start of Right Bar Register 0 (HDMI_FC_AVISRB0)..... 1743
34.5.80 Frame Composer AVI Packet Start of Right Bar Register 1 (HDMI_FC_AVISRB1)..... 1744
34.5.81 Frame Composer AUD Packet Configuration Register 0 (HDMI_FC_AUDICONF0)..... 1744
34.5.82 Frame Composer AUD Packet Configuration Register 1 (HDMI_FC_AUDICONF1)..... 1745
34.5.83 Frame Composer AUD Packet Configuration Register 2 (HDMI_FC_AUDICONF2)..... 1746
34.5.84 Frame Composer AUD Packet Configuration Register 3 (HDMI_FC_AUDICONF3)..... 1746
34.5.85 Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDIEEEID0)..... 1746
34.5.86 Frame Composer VSI Packet Data Size Register (HDMI_FC_VSDSIZE)..... 1747
34.5.87 Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDIEEEID1)..... 1748
34.5.88 Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDIEEEID2)..... 1748
34.5.89 Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDPAYLOAD0)..... 1749
34.5.90 Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDPAYLOAD1)..... 1749
34.5.91 Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDPAYLOAD2)..... 1750
34.5.92 Frame Composer VSI Packet Data IEEE Register 3 (HDMI_FC_VSDPAYLOAD3)..... 1750

34.5.93 Frame Composer VSI Packet Data IEEE Register 4 (HDMI_FC_VSDPAYLOAD4)..... 1751
34.5.94 Frame Composer VSI Packet Data IEEE Register 5 (HDMI_FC_VSDPAYLOAD5)..... 1751
34.5.95 Frame Composer VSI Packet Data IEEE Register 6 (HDMI_FC_VSDPAYLOAD6)..... 1752
34.5.96 Frame Composer VSI Packet Data IEEE Register 7 (HDMI_FC_VSDPAYLOAD7)..... 1752
34.5.97 Frame Composer VSI Packet Data IEEE Register 8 (HDMI_FC_VSDPAYLOAD8)..... 1753
34.5.98 Frame Composer VSI Packet Data IEEE Register 9 (HDMI_FC_VSDPAYLOAD9)..... 1753
34.5.99 Frame Composer VSI Packet Data IEEE Register 10 (HDMI_FC_VSDPAYLOAD10)..... 1754
34.5.100 Frame Composer VSI Packet Data IEEE Register 11 (HDMI_FC_VSDPAYLOAD11)..... 1754
34.5.101 Frame Composer VSI Packet Data IEEE Register 12 (HDMI_FC_VSDPAYLOAD12)..... 1755
34.5.102 Frame Composer VSI Packet Data IEEE Register 13 (HDMI_FC_VSDPAYLOAD13)..... 1755
34.5.103 Frame Composer VSI Packet Data IEEE Register 14 (HDMI_FC_VSDPAYLOAD14)..... 1756
34.5.104 Frame Composer VSI Packet Data IEEE Register 15 (HDMI_FC_VSDPAYLOAD15)..... 1756
34.5.105 Frame Composer VSI Packet Data IEEE Register 16 (HDMI_FC_VSDPAYLOAD16)..... 1757
34.5.106 Frame Composer VSI Packet Data IEEE Register 17 (HDMI_FC_VSDPAYLOAD17)..... 1757
34.5.107 Frame Composer VSI Packet Data IEEE Register 18 (HDMI_FC_VSDPAYLOAD18)..... 1758
34.5.108 Frame Composer VSI Packet Data IEEE Register 19 (HDMI_FC_VSDPAYLOAD19)..... 1758
34.5.109 Frame Composer VSI Packet Data IEEE Register 20 (HDMI_FC_VSDPAYLOAD20)..... 1759
34.5.110 Frame Composer VSI Packet Data IEEE Register 21 (HDMI_FC_VSDPAYLOAD21)..... 1759
34.5.111 Frame Composer VSI Packet Data IEEE Register 22 (HDMI_FC_VSDPAYLOAD22)..... 1760
34.5.112 Frame Composer VSI Packet Data IEEE Register 23 (HDMI_FC_VSDPAYLOAD23)..... 1760
34.5.113 Frame Composer SPD Packet Data Vendor Name Register 0 (HDMI_FC_SPDVENDORNAME0).....1761
34.5.114 Frame Composer SPD Packet Data Product Name Register 0 (HDMI_FC_SPDPRODUCTNAME0)... 1761
34.5.115 Frame Composer SPD Packet Data Source Product Descriptor Register (HDMI_FC_SPDDEVICEINF)..... 1762
34.5.116 Frame Composer Audio Sample Flat and Layout Configuration Register (HDMI_FC_AUDSCONF)... 1762
34.5.117 Frame Composer Audio Packet Sample Present Status Register (HDMI_FC_AUDSSTAT)..... 1763
34.5.118 Frame Composer Number of High Priority Packets Attended Configuration Register (HDMI_FC_CTRLQHIGH)..... 1764
34.5.119 Frame Composer Number of Low Priority Packets Attended Configuration Register (HDMI_FC_CTRLQLOW)..... 1764

34.5.120 Frame Composer ACP Packet Type Configuration Register 0 (HDMI_FC_ACP0).....1765
34.5.121 Frame Composer ACP Packet Type Configuration Register 1 (HDMI_FC_ACP1).....1765
34.5.122 FC_ISCR1_Frame Composer Packet Status, Valid, and Continue Configuration Register (HDMI_FC_ISCR1_0).....1766
34.5.123 Frame Composer ISCR1 Packet Body Register 1 (HDMI_FC_ISCR1_1)..... 1766
34.5.124 Frame Composer ISCR2 Packet Body Register 0 (HDMI_FC_ISCR2_0)..... 1767
34.5.125 Frame Composer Data Island Auto Packet Scheduling Register 0 (HDMI_FC_DATAUTO0)..... 1768
34.5.126 Frame Composer Data Island Auto Packet Scheduling Register 1 (HDMI_FC_DATAUTO1)..... 1768
34.5.127 Frame Composer Data Island Auto Packet Scheduling Register 2 (HDMI_FC_DATAUTO2)..... 1769
34.5.128 Frame Composer Data Island Manual Packet Request Register (HDMI_FC_DATMAN).....1770
34.5.129 Frame Composer Data Island Auto Packet Scheduling Register 3 (HDMI_FC_DATAUTO3)..... 1770
34.5.130 Frame Composer Round Robin ACR Packet Insertion Register 0 (HDMI_FC_RDRB0)..... 1771
34.5.131 Frame Composer Round Robin ACR Packet Insertion Register 1 (HDMI_FC_RDRB1)..... 1772
34.5.132 Frame Composer Round Robin ACR Packet Insertion Register 2 (HDMI_FC_RDRB2)..... 1772
34.5.133 Frame Composer Round Robin ACR Packet Insertion Register 3 (HDMI_FC_RDRB3)..... 1773
34.5.134 Frame Composer Round Robin ACR Packet Insertion Register 4 (HDMI_FC_RDRB4)..... 1773
34.5.135 Frame Composer Round Robin ACR Packet Insertion Register 5 (HDMI_FC_RDRB5)..... 1774
34.5.136 Frame Composer Round Robin ACR Packet Insertion Register 6 (HDMI_FC_RDRB6)..... 1775
34.5.137 Frame Composer Round Robin ACR Packet Insertion Register 7 (HDMI_FC_RDRB7)..... 1775
34.5.138 Frame Composer Packet Interrupt Mask Register 0 (HDMI_FC_MASK0)..... 1776
34.5.139 Frame Composer Packet Interrupt Mask Register 1 (HDMI_FC_MASK1)..... 1777
34.5.140 Frame Composer Pixel Repetition Configuration Register (HDMI_FC_PRCONF).....1777
34.5.141 Frame Composer GMD Packet Status Register (HDMI_FC_GMD_STAT)..... 1779
34.5.142 Frame Composer GMD Packet Enable Register (HDMI_FC_GMD_EN).....1780
34.5.143 Frame Composer GMD Packet Update Register (HDMI_FC_GMD_UP)..... 1780
34.5.144 Frame Composer GMD Packet Schedule Configuration Register (HDMI_FC_GMD_CONF)..... 1781
34.5.145 Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register (HDMI_FC_GMD_HB).....1782
34.5.146 Frame Composer GMD Packet Body Register 0 (HDMI_FC_GMD_PB0).....1782

34.5.147 Frame Composer GMD Packet Body Register 1 (HDMI_FC_GMD_PB1).....1783
34.5.148 Frame Composer GMD Packet Body Register 2 (HDMI_FC_GMD_PB2).....1783
34.5.149 Frame Composer GMD Packet Body Register 3 (HDMI_FC_GMD_PB3).....1784
34.5.150 Frame Composer GMD Packet Body Register 4 (HDMI_FC_GMD_PB4).....1784
34.5.151 Frame Composer GMD Packet Body Register 5 (HDMI_FC_GMD_PB5).....1785
34.5.152 Frame Composer GMD Packet Body Register 6 (HDMI_FC_GMD_PB6).....1785
34.5.153 Frame Composer GMD Packet Body Register 7 (HDMI_FC_GMD_PB7).....1786
34.5.154 Frame Composer GMD Packet Body Register 8 (HDMI_FC_GMD_PB8).....1786
34.5.155 Frame Composer GMD Packet Body Register 9 (HDMI_FC_GMD_PB9).....1787
34.5.156 Frame Composer GMD Packet Body Register 10 (HDMI_FC_GMD_PB10).....1787
34.5.157 Frame Composer GMD Packet Body Register 11 (HDMI_FC_GMD_PB11).....1788
34.5.158 Frame Composer GMD Packet Body Register 12 (HDMI_FC_GMD_PB12).....1788

34.5.289 CSC_COEF_C2_LSB (HDMI_CSC_COEF_C2_LSB)....1864
34.5.290 CSC_COEF_C3_MSB (HDMI_CSC_COEF_C3_MSB)....1865
34.5.291 CSC_COEF_C3_LSB (HDMI_CSC_COEF_C3_LSB)....1865
34.5.292 CSC_COEFC4_MSB (HDMI_CSC_COEFC4_MSB)....1866
34.5.293 CSC_COEFC4_LSB (HDMI_CSC_COEFC4_LSB)....1866
34.5.294 CEC_CTRL (HDMI_CEC_CTRL)....1867
34.5.295 CEC_MASK (HDMI_CEC_MASK)....1868
34.5.296 CEC_ADDR_L (HDMI_CEC_ADDR_L)....1869
34.5.297 CEC_ADDR_H (HDMI_CEC_ADDR_H)....1870
34.5.298 CEC_TX_CNT (HDMI_CEC_TX_CNT)....1871
34.5.299 CEC_RX_CNT (HDMI_CEC_RX_CNT)....1872
34.5.300 CEC_TX_DATA (HDMI_CEC_TX_DATA*n*)....1873
34.5.301 CEC_RX_DATA (HDMI_CEC_RX_DATA*n*)....1873
34.5.302 CEC_LOCK (HDMI_CEC_LOCK)....1874
34.5.303 CEC_WKUPCTRL (HDMI_CEC_WKUPCTRL)....1874
34.5.304 I2CM_SLAVE (HDMI_I2CM_SLAVE)....1875
34.5.305 I2CM_ADDRESS (HDMI_I2CM_ADDRESS)....1876
34.5.306 I2CM_DATAO (HDMI_I2CM_DATAO)....1876
34.5.307 I2CM_DATAI (HDMI_I2CM_DATAI)....1877
34.5.308 I2CM_OPERATION (HDMI_I2CM_OPERATION)....1877
34.5.309 I2CM_INT (HDMI_I2CM_INT)....1878
34.5.310 I2CM_CTLINT (HDMI_I2CM_CTLINT)....1879
34.5.311 I2CM_DIV (HDMI_I2CM_DIV)....1879
34.5.312 I2CM_SEGADDR (HDMI_I2CM_SEGADDR)....1880
34.5.313 I2CM_SOFTRSTZ (HDMI_I2CM_SOFTRSTZ)....1881

34.5.314 I2CM_SEGPTR (HDMI_I2CM_SEGPTR) 1881
34.5.315 I2CM_SS_SCL_HCNT_1_ADDR (HDMI_I2CM_SS_SCL_HCNT_1_ADDR) 1882
34.5.316 I2CM_SS_SCL_HCNT_0_ADDR (HDMI_I2CM_SS_SCL_HCNT_0_ADDR) 1882
34.5.317 I2CM_SS_SCL_LCNT_1_ADDR (HDMI_I2CM_SS_SCL_LCNT_1_ADDR) 1883
34.5.318 I2CM_SS_SCL_LCNT_0_ADDR (HDMI_I2CM_SS_SCL_LCNT_0_ADDR) 1883
34.5.319 I2CM_FS_SCL_HCNT_1_ADDR (HDMI_I2CM_FS_SCL_HCNT_1_ADDR) 1884
34.5.320 I2CM_FS_SCL_HCNT_0_ADDR (HDMI_I2CM_FS_SCL_HCNT_0_ADDR) 1884
34.5.321 I2CM_FS_SCL_LCNT_1_ADDR (HDMI_I2CM_FS_SCL_LCNT_1_ADDR) 1885
34.5.322 I2CM_FS_SCL_LCNT_0_ADDR (HDMI_I2CM_FS_SCL_LCNT_0_ADDR) 1885
34.5.323 BASE_POINTER_ADDR (HDMI_BASE_POINTER_ADDR) 1886

Chapter 35
HDMI 3D Tx PHY (HDMI_PHY)

35.1 Overview 1887
35.1.1 General Description 1887
35.1.2 Applications 1887
35.1.3 Standards Compliance 1888
35.1.4 Features 1888
35.1.5 HDMI 3D Tx PHY System-Level Overview 1889
35.1.5.1 System-Level Block Diagram 1889
35.1.5.2 HDMI 3D Tx PHY 1889
35.1.5.2.1 Interfaces 1890
35.1.5.3 HDMI 1.4 I/O Pads 1890
35.1.5.3.1 I/O Pads Description 1890
35.2 External Signals 1891
35.2.1 Top-Level I/O Diagram 1892
35.2.2 Top -Level Signal Descriptions 1893
35.2.2.1 TMDS Interface 1894
35.2.2.2 Reset Signals 1894
35.2.2.3 External Component 1895

35.3 Functional Description....1895
35.3.1 Functional Overview....1895
35.3.2 Operating Modes....1897
35.3.2.1 Power-Down Mode....1898
35.3.2.2 Active Mode....1899
35.3.2.2.1 Wide Interface Mode....1901
35.3.2.3 Power Sequence....1901
35.3.2.3.1 PLL/MPLL....1904
35.3.2.3.2 Resistor, ADC Calibration....1906
35.3.2.3.3 Clock Alignment....1908
35.3.2.4 Color Depth and Color Mode Selection....1909
35.3.2.4.1 Pixel Repetition Clock Generation Selection....1909
35.3.3 Configuration and Test Mode....1909
35.3.3.1 Power-Up Configuration....1910
35.4 System-Level Implementation....1913
35.4.1 System Operation....1913
35.4.1.1 Powering Up and Powering Down....1913
35.4.1.2 Active Mode Requirements....1915
35.4.1.3 Power-Up Requirements....1915
35.4.1.4 Power Supply Sequence When the HDMI 3D Tx PHY is Not Used....1915
35.4.1.5 Power-Down Requirements....1915
35.5 Reference Clock....1915
35.6 Control Registers....1916
35.6.1 Control Registers Module Design Architecture....1916
35.7 HDMI_PHY Memory Map/Register Definition....1916
35.7.1 Power Control (HDMI_PHY_PWRCTRL)....1918
35.7.2 Serializer Divider Control (HDMI_PHY_SERDIVCTRL)....1920
35.7.3 Serializer Clock Control (HDMI_PHY_SERCKCTRL)....1920
35.7.4 Serializer Clock Kill Control (HDMI_PHY_SERCKKILLCTRL)....1921

35.7.5 Transmitter and Resistance Calibration Control (HDMI_PHY_TXRESCTRL)..... 1922
35.7.6 Clock Calibration Control (HDMI_PHY_CKCALCTRL)..... 1923
35.7.7 Color Depth, Pixel Repetition, Clock Divider for PLL and MPLL, and Edge Rate Control (HDMI_PHY_CPCE_CTRL)..... 1924
35.7.8 Tx and Clock Measure Control (HDMI_PHY_TXCLKMEASCTRL)..... 1926
35.7.9 Tx Measure Control (HDMI_PHY_TXMEASCTRL)..... 1927
35.7.10 Clock Symbol and Transmitter Control (HDMI_PHY_CKSYMTXCTRL)..... 1929
35.7.11 Comparator Sequence Control (HDMI_PHY_CMPSEQCTRL)..... 1930
35.7.12 Comparator Power Control (HDMI_PHY_CMPPWRCTRL)..... 1931
35.7.13 Comparator Mode Control (HDMI_PHY_CMPMODECTRL)..... 1931
35.7.14 Measure Control (HDMI_PHY_MEASCTRL)..... 1932
35.7.15 Voltage Level Control (HDMI_PHY_VLEVCTRL)..... 1933
35.7.16 Digital-to-Analog Control (HDMI_PHY_D2ACTRL)..... 1934
35.7.17 Current Control (HDMI_PHY_CURRCTRL)..... 1935
35.7.18 Drive Analog Control (HDMI_PHY_DRVANACTRL)..... 1935
35.7.19 PLL Measure Control (HDMI_PHY_PLLMEASCTRL)..... 1936
35.7.20 PLL Phase and Bypass Control (HDMI_PHY_PLLPHBYCTRL)..... 1938
35.7.21 Gear Shift, Reset Mode, and Power State Control (HDMI_PHY_GRP_CTRL)..... 1939
35.7.22 Gmp Control (HDMI_PHY_GMPCTRL)..... 1940
35.7.23 MPLL Measure Control (HDMI_PHY_MPLLMEASCTRL)..... 1941
35.7.24 MPLL and PLL Phase, Scope Clock Select, and MUX Clock Control (HDMI_PHY_MSM_CTRL)..... 1943
35.7.25 Scope, Comparator Result and Power Bad Status (HDMI_PHY_SCRPB_STATUS)..... 1944
35.7.26 Transmission Termination (HDMI_PHY_TXTERM)..... 1946
35.7.27 Power Sequence, TX Clock Alignment, Resistance Calibration, Pattern Generator Skip Bit, and TMDS Encoder Enable (HDMI_PHY_PTRPT_ENBL)..... 1947
35.7.28 Pattern Generator Mode (HDMI_PHY_PATTERNGEN)..... 1949
35.7.29 The Soft-Reset and DAC Enable, Clock Alignment and PG Mode (HDMI_PHY_SDCAP_MODE)..... 1950
35.7.30 Scope Mode register (HDMI_PHY_SCOPEMODE)..... 1952
35.7.31 Digital Transmission Mode (HDMI_PHY_DIGTXMODE)..... 1953

35.7.32 Scope, Transmission Clock Alignment, and Resistance Calibration Set-on-Done Status (HDMI_PHY_STR_STATUS)..... 1957
35.7.33 Scope Counter on Channel 0 (HDMI_PHY_SCOPECNT0)..... 1959
35.7.34 Scope Counter on Channel 1 (HDMI_PHY_SCOPECNT1)..... 1959
35.7.35 Scope Counter on Channel 2 (HDMI_PHY_SCOPECNT2)..... 1960
35.7.36 Scope Counter on Clock Channel (HDMI_PHY_SCOPECNTCLK)..... 1960
35.7.37 Scope Sample Count MSB, Scope Sample Repetition (HDMI_PHY_SCOPESAMPLE)..... 1961
35.7.38 Scope Counter MSB Channel 0 and Channel 1 (HDMI_PHY_SCOPECNTMSB01)..... 1962
35.7.39 Scope Counter MSB Channel 2 and Clock Channel (HDMI_PHY_SCOPECNTMSB2CK)..... 1962
35.8 Appendix A: Driver Voltage Level Configuration..... 1963
35.9 Appendix B..... 1964
35.9.1 Single or Two-PLL in Coherent or Non-Coherent Mode of Operation..... 1965
35.9.2 PLL/MPLL Generic Configuration Settings..... 1965
35.10 Appendix C: 3D Video Formats..... 1971

Chapter 36
I2C Controller (I2C)

36.1 Overview..... 1975
36.1.1 Features..... 1977
36.1.2 Modes and operations..... 1978
36.2 External Signals..... 1978
36.3 Clocks..... 1979
36.4 Functional description..... 1979
36.4.1 I2C system configuration..... 1979
36.4.2 Arbitration procedure..... 1980
36.4.3 Clock synchronization..... 1980
36.4.4 Handshaking..... 1981
36.4.5 Clock stretching..... 1981
36.4.6 Peripheral bus accesses..... 1982
36.4.7 Generation of transfer error on IP bus..... 1982

36.4.8 Reset....1982
36.4.9 Interrupts....1982
36.4.10 Byte order....1982
36.5 Initialization....1983
36.5.1 Initialization sequence....1983
36.5.2 Generation of Start....1983
36.5.3 Post-transfer software response....1983
36.5.4 Generation of Stop....1984
36.5.5 Generation of Repeated Start....1984
36.5.6 Slave mode....1985
36.5.7 Arbitration lost....1985
36.6 Software restriction....1991
36.7 I2C Memory Map/Register Definition....1992
36.7.1 I2C Address Register (I2C*x*_IADR)....1993
36.7.2 I2C Frequency Divider Register (I2C*x*_IFDR)....1993
36.7.3 I2C Control Register (I2C*x*_I2CR)....1995
36.7.4 I2C Status Register (I2C*x*_I2SR)....1996
36.7.5 I2C Data I/O Register (I2C*x*_I2DR)....1998

Chapter 37
IOMUX Controller (IOMUXC)

37.1 Overview....1999
37.1.1 Features....2000
37.2 Clocks....2001
37.3 Functional description....2001
37.3.1 ALT6 and ALT7 extended muxing modes....2002
37.3.2 SW Loopback through SION bit....2003
37.3.3 Daisy chain - multi pads driving same module input pin....2003
37.4 IOMUXC Memory Map/Register Definition....2004
37.4.1 GPR0 (IOMUXC_GPR0)....2031

37.4.2 GPR1 (IOMUXC_GPR1)..... 2034
37.4.3 GPR2 (IOMUXC_GPR2)..... 2037
37.4.4 GPR3 (IOMUXC_GPR3)..... 2039
37.4.5 GPR4 (IOMUXC_GPR4)..... 2043
37.4.6 GPR5 (IOMUXC_GPR5)..... 2046
37.4.7 GPR6 (IOMUXC_GPR6)..... 2047
37.4.8 GPR7 (IOMUXC_GPR7)..... 2048
37.4.9 GPR8 (IOMUXC_GPR8)..... 2048
37.4.10 GPR9 (IOMUXC_GPR9)..... 2050
37.4.11 GPR10 (IOMUXC_GPR10)..... 2051
37.4.12 GPR11 (IOMUXC_GPR11)..... 2053
37.4.13 GPR12 (IOMUXC_GPR12)..... 2053
37.4.14 GPR13 (IOMUXC_GPR13)..... 2055
37.4.15 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA10)..... 2057
37.4.16 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA11)..... 2058
37.4.17 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA12)..... 2059
37.4.18 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA13)..... 2060
37.4.19 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA14)..... 2061
37.4.20 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA15)..... 2062
37.4.21 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA16)..... 2063
37.4.22 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA17)..... 2064
37.4.23 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA18)..... 2065
37.4.24 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA19)..... 2066
37.4.25 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA04)..... 2067
37.4.26 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA05)..... 2068
37.4.27 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA06)..... 2069
37.4.28 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA07)..... 2070
37.4.29 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA08)..... 2071
37.4.30 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA09)..... 2072

37.4.31 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_DATA_EN)..... 2073
37.4.32 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_HSYNC)..... 2074
37.4.33 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_PIXCLK)..... 2075
37.4.34 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI0_VSYNC)..... 2076
37.4.35 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DI0_DISP_CLK)..... 2077
37.4.36 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DI0_PIN15)..... 2077
37.4.37 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DI0_PIN02)..... 2078
37.4.38 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DI0_PIN03)..... 2079
37.4.39 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DI0_PIN04)..... 2079
37.4.40 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA00)..... 2080
37.4.41 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA01)..... 2081
37.4.42 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA10)..... 2082
37.4.43 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA11)..... 2082
37.4.44 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA12)..... 2083
37.4.45 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA13)..... 2084
37.4.46 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA14)..... 2085
37.4.47 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA15)..... 2086
37.4.48 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA16)..... 2087
37.4.49 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA17)..... 2088
37.4.50 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA18)..... 2089
37.4.51 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA19)..... 2090
37.4.52 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA02)..... 2091
37.4.53 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA20)..... 2092
37.4.54 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA21)..... 2093
37.4.55 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA22)..... 2094
37.4.56 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA23)..... 2095
37.4.57 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA03)..... 2096
37.4.58 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA04)..... 2097
37.4.59 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA05)..... 2098

37.4.60 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_DISP0_DATA06)..... 2099

37.4.564 Select Input Register (IOMUXC_SDMA_EVENTS14_SELECT_INPUT).....2784
37.4.565 Select Input Register (IOMUXC_SDMA_EVENTS15_SELECT_INPUT).....2785
37.4.566 Select Input Register (IOMUXC_SPDIF_SPDIF_IN1_SELECT_INPUT).....2785
37.4.567 Select Input Register (IOMUXC_SPDIF_TX_CLK2_SELECT_INPUT).....2786
37.4.568 Select Input Register (IOMUXC_UART1_UART_RTS_B_SELECT_INPUT).....2787
37.4.569 Select Input Register (IOMUXC_UART1_UART_RX_DATA_SELECT_INPUT)..... 2787
37.4.570 Select Input Register (IOMUXC_UART2_UART_RTS_B_SELECT_INPUT).....2788
37.4.571 Select Input Register (IOMUXC_UART2_UART_RX_DATA_SELECT_INPUT)..... 2789
37.4.572 Select Input Register (IOMUXC_UART3_UART_RTS_B_SELECT_INPUT).....2789
37.4.573 Select Input Register (IOMUXC_UART3_UART_RX_DATA_SELECT_INPUT)..... 2790
37.4.574 Select Input Register (IOMUXC_UART4_UART_RTS_B_SELECT_INPUT).....2791
37.4.575 Select Input Register (IOMUXC_UART4_UART_RX_DATA_SELECT_INPUT)..... 2791
37.4.576 Select Input Register (IOMUXC_UART5_UART_RTS_B_SELECT_INPUT).....2792
37.4.577 Select Input Register (IOMUXC_UART5_UART_RX_DATA_SELECT_INPUT)..... 2793
37.4.578 Select Input Register (IOMUXC_USB_OTG_OC_SELECT_INPUT)..... 2794
37.4.579 Select Input Register (IOMUXC_USB_H1_OC_SELECT_INPUT).....2795
37.4.580 Select Input Register (IOMUXC_USDHC1_CARD_CLK_IN_SELECT_INPUT).....2796
37.4.581 Select Input Register (IOMUXC_USDHC1_WP_ON_SELECT_INPUT)..... 2797

37.4.582 Select Input Register (IOMUXC_USDHC2_CARD_CLK_IN_SELECT_INPUT)....2798
37.4.583 Select Input Register (IOMUXC_USDHC3_CARD_CLK_IN_SELECT_INPUT)....2799
37.4.584 Select Input Register (IOMUXC_USDHC4_CARD_CLK_IN_SELECT_INPUT)....2800

Chapter 38
Image Processing Unit (IPU)

38.1 Overview....2801
38.1.1 Architecture....2802
38.1.2 Features And Functionality....2803
38.1.2.1 External Ports....2803
38.1.2.1.1 Camera Ports....2803
38.1.2.1.2 Display Ports....2807
38.1.2.1.2.1 Access Modes....2807
38.1.2.1.2.2 Display Interface....2809
38.1.2.1.3 Memory Port....2812
38.1.2.1.4 Processing....2814
38.1.2.1.4.1 Processing flows....2814
38.1.2.1.4.2 Display Processor (DP)....2815
38.1.2.1.5 Video De-Interlacer or Combiner (VDIC)....2816
38.1.2.1.5.1 De-interlacing in the VDIC....2816
38.1.2.1.5.2 Combining in the VDIC....2817
38.1.2.1.5.3 Image Converter (IC)....2817
38.1.2.1.5.4 Image Rotator (IRT)....2818
38.1.2.1.6 Automatic Procedures....2819
38.1.2.1.6.1 Screen Refresh....2819
38.1.2.1.6.2 Update Of The Display Buffer....2820
38.1.2.1.6.3 Camera Preview....2820
38.2 External Signals....2820
38.3 Clocks....2825
38.4 Functional Description....2825

38.4.1 IPU detailed block diagram....2825
38.4.2 Image DMA Controller (IDMAC)....2827
38.4.2.1 IDMAC's channels....2829
38.4.2.2 IBIW & IBIR - Internal bus interface for write and read....2831
38.4.2.3 FCW & FCR - Format converter write and read....2831
38.4.2.4 Buffering units....2834
38.4.2.4.1 Handling real time channels....2835
38.4.2.5 AXIW - AXI Write and AXIR - AXI Read....2835
38.4.2.6 CC_W & CC_R - Channel Control Write and Read....2835
38.4.2.6.1 Locking the arbitration and reordering the AXI bursts....2836
38.4.2.7 AAU_W & AAU_R- Address Arithmetic Unit for Write and Read....2837
38.4.2.7.1 Scrolling support....2839
38.4.2.8 ATC - Alpha Transparency Controller....2839
38.4.2.8.1 Conditional read....2841
38.4.2.9 LUT- Look Up Table....2841
38.4.2.10 CPMEM - Channel Parameter Memory....2842
38.4.2.10.1 CPMEM's words' structure for non interleaved mode....2843
38.4.2.10.2 CPMEM's words' structure for interleaved mode....2848
38.4.2.10.3 Accessing the CPMEM for programming....2856
38.4.2.10.4 Alternate IDMAC settings....2857
38.4.2.11 IDMAC's modes of operation....2857
38.4.2.11.1 Rotation modes....2857
38.4.2.11.2 Frame size....2858
38.4.2.12 IDMAC's restriction....2860
38.4.2.13 IDMAC's Endianness support....2860
38.4.2.14 IDMAC's internal events....2861
38.4.3 Camera Sensor Interface (CSI)....2861
38.4.3.1 CSI Block Diagram....2861
38.4.3.2 CSI Interface....2862

38.4.3.2.1 Parallel Interface 2862
38.4.3.2.2 High-speed serial interface - MIPI (Mobile Industry Processor Interface). .. 2863
38.4.3.3 Test Mode 2863
38.4.3.4 Sensor Image Frame Relations 2864
38.4.3.5 Companding 2865
38.4.3.6 Timing/Data mode protocols 2866
38.4.3.6.1 Gated Mode 2866
38.4.3.6.2 Non-Gated Mode 2866
38.4.3.6.3 BT.656 mode 2867
38.4.3.6.4 BT.1120 mode 2867
38.4.3.7 Packing to memory 2868
38.4.3.8 Skipping frames 2869
38.4.3.9 16 bit camera support 2869
38.4.3.10 CSI Restrictions 2870
38.4.4 Sensor Multi FIFO Controller (SMFC) 2870
38.4.4.1 SMFC's Features 2871
38.4.4.2 SMFC's Functional description 2871
38.4.4.2.1 SMFC Master interface 2874
38.4.4.2.2 Restrictions 2875
38.4.5 Image Converter 2875
38.4.5.1 IC Block Diagram 2875
38.4.5.2 Processing tasks 2876
38.4.5.3 Downsizing Section 2877
38.4.5.4 Main Processing Section 2879
38.4.5.5 Rotation Section 2882
38.4.5.6 IC Task Parameter Memory 2884
38.4.5.7 IC's DMA channels 2888
38.4.5.8 IC restrictions 2889
38.4.5.9 IC bridge 2889

38.4.6 Display port....2889
38.4.6.1 Display ports channels....2890
38.4.6.2 Supported display interfaces....2891
38.4.6.2.1 Synchronous Interfaces....2892
38.4.6.2.2 Asynchronous Parallel Interfaces....2892
38.4.6.3 Display port's bandwidth....2892
38.4.6.4 Display Dual Mode....2893
38.4.6.5 Display Errors....2893
38.4.6.5.1 Data starvation errors....2893
38.4.6.5.2 Anti tearing errors....2894
38.4.6.6 Display port's restrictions....2894
38.4.7 DC - Display Controller....2895
38.4.7.1 Channels flow control....2897
38.4.7.1.1 New Frame control....2897
38.4.7.1.2 Antitearing control....2897
38.4.7.1.3 User command mode control....2897
38.4.7.2 Arbitration Unit....2898
38.4.7.2.1 Access request generator....2898
38.4.7.2.2 DI arbiter....2898
38.4.7.2.3 Source arbiter....2898
38.4.7.3 Microcode processing unit....2899
38.4.7.3.1 Channels address control....2899
38.4.7.3.2 General purpose Data oriented events counters....2899
38.4.7.3.3 Microcode address generator....2899
38.4.7.3.4 Template's Memory Access Arbiter....2900
38.4.7.4 DC's Template structure....2900
38.4.7.4.1 DC template's memory map....2900
38.4.7.5 Display controls' generator....2908
38.4.7.5.1 Bus Mapping Unit....2909

38.4.8 DMFC - Display Multi FIFO Controller....2914
38.4.8.1 DP and DC read channels....2915
38.4.8.1.1 FIFO allocation to channels....2915
38.4.8.1.2 Arbitration between channels....2916
38.4.8.1.3 Watermark....2916
38.4.8.2 IC interface....2917
38.4.8.3 DC write channel and AHB accesses....2917
38.4.9 DP - Display Processor....2917
38.4.9.1 The DP programming model....2918
38.4.9.2 Displayed Planes....2918
38.4.9.3 Combining Unit....2919
38.4.9.4 Cursor Generator....2920
38.4.9.5 Color Space Conversion unit - CSC....2920
38.4.9.5.1 Gamut mapping....2922
38.4.9.6 Gamma correction....2923
38.4.9.7 DC interface....2924
38.4.9.8 DP's flows management....2924
38.4.9.9 DP debug unit....2926
38.4.9.10 Restriction....2927
38.4.10 Display Interface (DI)....2927
38.4.10.1 DC interface, data accumulator and clock domain synchronizer....2929
38.4.10.2 Parallel interface data synchronizer and data oriented interface....2929
38.4.10.3 Timing generator....2929
38.4.10.3.1 Waveform concatenation....2931
38.4.10.3.2 The basic counter....2932
38.4.10.3.3 Counter number 9....2935
38.4.10.3.4 DI's active window....2935
38.4.10.4 Waveform settings for asynchronous interface pins....2936
38.4.10.5 Low Level Access - LLA....2938

38.4.10.6 Using a mask channel 2938
38.4.11 Video De Interlacing or Combining Block (VDIC) 2938
38.4.11.1 VDIC Features 2941
38.4.11.2 De interlacer (DI) sub-block 2941
38.4.11.2.1 Vertical Filter Block (di_vfilt) 2941
38.4.11.2.2 Motion Calculator Block (di_mcalc) 2942
38.4.11.2.3 Spatial Motion Filter (di_sfilt) 2943
38.4.11.2.4 Interpolated Pixel Calculator Block (di_interp) 2943
38.4.11.2.5 Median Filter Block (di_med) 2943
38.4.11.2.6 Soft Switch Block (di_sswitch) 2943
38.4.11.3 DMA only Mode 2944
38.4.11.4 Real Time Mode 2944
38.4.11.5 CSI only Mode 2944
38.4.11.6 Using Combining in the VDIC 2944
38.4.11.7 VDIC Restrictions 2945
38.4.12 Control Module (CM) 2945
38.4.12.1 Block Diagram 2946
38.4.12.2 Frame Synchronization Unit 2947
38.4.12.2.1 General Description 2947
38.4.12.2.2 Frame Synchronization Flow 2947
38.4.12.2.3 FSU's fundamentals 2948
38.4.12.2.4 IPU main flows 2951
38.4.12.2.5 Sub-Frame Double-Buffering (Band Mode) 2959
38.4.12.2.6 Automatic Window Refresh 2960
38.4.12.2.7 VPU Sub Frame Synchronization 2960
38.4.12.2.8 IPU VDOA synchronization 2960
38.4.12.3 Interrupt Generator 2961
38.4.12.4 SDMA event generator 2967
38.4.12.5 General Configuration Registers 2968

38.4.12.6 Shadow Registers Module (SRM)..... 2968
38.4.12.6.1 Switching between 2 flows..... 2968
38.4.12.6.2 Updating parameters between frames..... 2969
38.4.12.6.3 Updating the memory..... 2969
38.4.12.6.4 SRM priority..... 2970
38.4.12.6.5 SRM entries mapping..... 2970
38.4.12.7 Memory Access Unit..... 2987
38.4.12.8 SISG - Still Image Synchronization Generator..... 2988
38.4.12.9 Clock Change procedure..... 2990
38.4.12.10 Low Power Modes..... 2991
38.4.12.10.1 STOP Mode..... 2992
38.4.12.10.2 Low Power Screen Refresh mode - LPSR..... 2993
38.5 IPU Memory Map/Register Definition..... 2995
38.5.1 Configuration Register (IPU_CONF)..... 3014
38.5.2 SISG Control 0 Register (IPU_SISG_CTRL0)..... 3017
38.5.3 SISG Control 1 Register (IPU_SISG_CTRL1)..... 3018
38.5.4 SISG Set<i> Register (IPU_SISG_SET_i)..... 3018
38.5.5 SISG Clear <i> Register (IPU_SISG_CLR_i)..... 3019
38.5.6 Interrupt Control Register 1 (IPU_INT_CTRL_1)..... 3020
38.5.7 Interrupt Control Register 2 (IPU_INT_CTRL_2)..... 3024
38.5.8 Interrupt Control Register 3 (IPU_INT_CTRL_3)..... 3026
38.5.9 Interrupt Control Register 4 (IPU_INT_CTRL_4)..... 3030
38.5.10 Interrupt Control Register 5 (IPU_INT_CTRL_5)..... 3033
38.5.11 Interrupt Control Register 6 (IPU_INT_CTRL_6)..... 3038
38.5.12 Interrupt Control Register 7 (IPU_INT_CTRL_7)..... 3041
38.5.13 Interrupt Control Register 8 (IPU_INT_CTRL_8)..... 3043
38.5.14 Interrupt Control Register 9 (IPU_INT_CTRL_9)..... 3045
38.5.15 Interrupt Control Register 10 (IPU_INT_CTRL_10)..... 3047
38.5.16 Interrupt Control Register 11 (IPU_INT_CTRL_11)..... 3049

38.5.17 Interrupt Control Register 12 (IPU_INT_CTRL_12)..... 3052

38.5.314 DC Write Channel 9Configuration 2Register (IPU_DC_WR_CH_CONF2_9)....3507
38.5.315 DC Routine Link Register 1 Channel 9 (IPU_DC_RL1_CH_9)....3508
38.5.316 DC Routine Link Register 2 Channel 9 (IPU_DC_RL2_CH_9)....3509
38.5.317 DC Routine Link Register 3Channel 9 (IPU_DC_RL3_CH_9)....3510
38.5.318 DC Routine Link Register 4 Channel 9 (IPU_DC_RL4_CH_9)....3510
38.5.319 DC Routine Link Register 5 Channel 9 (IPU_DC_RL5_CH_9)....3511
38.5.320 DC Routine Link Register 6 Channel 9 (IPU_DC_RL6_CH_9)....3512
38.5.321 DC General Register (IPU_DC_GEN)....3512
38.5.322 DC Display Configuration 1 Register 0 (IPU_DC_DISP_CONF1_0)....3514
38.5.323 DC Display Configuration 1 Register 1 (IPU_DC_DISP_CONF1_1)....3515
38.5.324 DC Display Configuration 1 Register 2 (IPU_DC_DISP_CONF1_2)....3517
38.5.325 DC Display Configuration 1 Register 3 (IPU_DC_DISP_CONF1_3)....3518
38.5.326 DC Display Configuration 2 Register 0 (IPU_DC_DISP_CONF2_0)....3519
38.5.327 DC Display Configuration 2 Register 1 (IPU_DC_DISP_CONF2_1)....3520
38.5.328 DC Display Configuration 2 Register 2 (IPU_DC_DISP_CONF2_2)....3520
38.5.329 DC Display Configuration 2 Register 3 (IPU_DC_DISP_CONF2_3)....3520
38.5.330 DC DI0Configuration Register 1 (IPU_DC_DI0_CONF_1)....3521
38.5.331 DC DI0Configuration Register 2 (IPU_DC_DI0_CONF_2)....3521

38.5.332 DC DI1Configuration Register 1 (IPU_DC_DI1_CONF_1).....3521
38.5.333 DC DI1Configuration Register 2 (IPU_DC_DI1_CONF_2).....3522
38.5.334 DC Mapping Configuration Register 0 (IPU_DC_MAP_CONF_0).....3522
38.5.335 DC Mapping Configuration Register 1 (IPU_DC_MAP_CONF_1).....3523
38.5.336 DC Mapping Configuration Register 2 (IPU_DC_MAP_CONF_2).....3524
38.5.337 DC Mapping Configuration Register 3 (IPU_DC_MAP_CONF_3).....3525
38.5.338 DC Mapping Configuration Register 4 (IPU_DC_MAP_CONF_4).....3526
38.5.339 DC Mapping Configuration Register 5 (IPU_DC_MAP_CONF_5).....3527
38.5.340 DC Mapping Configuration Register 6 (IPU_DC_MAP_CONF_6).....3528
38.5.341 DC Mapping Configuration Register 7 (IPU_DC_MAP_CONF_7).....3529
38.5.342 DC Mapping Configuration Register 8 (IPU_DC_MAP_CONF_8).....3530
38.5.343 DC Mapping Configuration Register 9 (IPU_DC_MAP_CONF_9).....3531
38.5.344 DC Mapping Configuration Register 10 (IPU_DC_MAP_CONF_10).....3532
38.5.345 DC Mapping Configuration Register 11 (IPU_DC_MAP_CONF_11).....3533
38.5.346 DC Mapping Configuration Register 12 (IPU_DC_MAP_CONF_12).....3534
38.5.347 DC Mapping Configuration Register 13 (IPU_DC_MAP_CONF_13).....3535
38.5.348 DC Mapping Configuration Register 14 (IPU_DC_MAP_CONF_14).....3536
38.5.349 DC Mapping Configuration Register 15 (IPU_DC_MAP_CONF_15).....3537
38.5.350 DC Mapping Configuration Register 16 (IPU_DC_MAP_CONF_16).....3537
38.5.351 DC Mapping Configuration Register 17 (IPU_DC_MAP_CONF_17).....3538
38.5.352 DC Mapping Configuration Register 18 (IPU_DC_MAP_CONF_18).....3539
38.5.353 DC Mapping Configuration Register 19 (IPU_DC_MAP_CONF_19).....3539
38.5.354 DC Mapping Configuration Register 20 (IPU_DC_MAP_CONF_20).....3540
38.5.355 DC Mapping Configuration Register 21 (IPU_DC_MAP_CONF_21).....3541
38.5.356 DC Mapping Configuration Register 22 (IPU_DC_MAP_CONF_22).....3541
38.5.357 DC Mapping Configuration Register 23 (IPU_DC_MAP_CONF_23).....3542
38.5.358 DC Mapping Configuration Register 24 (IPU_DC_MAP_CONF_24).....3543
38.5.359 DC Mapping Configuration Register 25 (IPU_DC_MAP_CONF_25).....3543
38.5.360 DC Mapping Configuration Register 26 (IPU_DC_MAP_CONF_26).....3544

38.5.361 DC User General Data Event 0 Register 0 (IPU_DC_UGDE0_0)....3545
38.5.362 DC User General Data Event 0 Register 1 (IPU_DC_UGDE0_1)....3546
38.5.363 DC User General Data Event 0 Register2 (IPU_DC_UGDE0_2)....3547
38.5.364 DC User General Data Event 0 Register 3 (IPU_DC_UGDE0_3)....3547
38.5.365 DC User General Data Event 1Register0 (IPU_DC_UGDE1_0)....3548
38.5.366 DC User General Data Event 1 Register 1 (IPU_DC_UGDE1_1)....3549
38.5.367 DC User General Data Event 1Register 2 (IPU_DC_UGDE1_2)....3550
38.5.368 DC User General Data Event 1Register 3 (IPU_DC_UGDE1_3)....3550
38.5.369 DC User General Data Event 2 Register 0 (IPU_DC_UGDE2_0)....3551
38.5.370 DC User General Data Event 2 Register 1 (IPU_DC_UGDE2_1)....3552
38.5.371 DC User General Data Event 2Register 2 (IPU_DC_UGDE2_2)....3553
38.5.372 DC User General Data Event 2Register 3 (IPU_DC_UGDE2_3)....3553
38.5.373 DC User General Data Event 3Register 0 (IPU_DC_UGDE3_0)....3554
38.5.374 DC User General Data Event 3Register 1 (IPU_DC_UGDE3_1)....3555
38.5.375 DC User General Data Event 3Register 2 (IPU_DC_UGDE3_2)....3556
38.5.376 DC User General Data Event 3Register 2 (IPU_DC_UGDE3_3)....3556
38.5.377 DC Low Level Access Control Register 0 (IPU_DC_LLA0).... 3556
38.5.378 DC Low Level Access Control Register 1 (IPU_DC_LLA1).... 3557
38.5.379 DC Read Low Level Read Access Control Register 0 (IPU_DC_R_LLA0).... 3557
38.5.380 DC Read Low Level Read Access Control Register1 (IPU_DC_R_LLA1).... 3558
38.5.381 DC Write Channel 5 Configuration Register (IPU_DC_WR_CH_ADDR_5_ALT).... 3558
38.5.382 DC Status Register (IPU_DC_STAT).... 3560
38.5.383 DMFC Read Channel Register (IPU_DMFC_RD_CHAN).... 3562
38.5.384 DMFC Write Channel Register (IPU_DMFC_WR_CHAN).... 3564
38.5.385 DMFC Write Channel Definition Register (IPU_DMFC_WR_CHAN_DEF).... 3567
38.5.386 DMFC Display Processor Channel Register (IPU_DMFC_DP_CHAN)....3569
38.5.387 DMFC Display Processor Channel Definition Register (IPU_DMFC_DP_CHAN_DEF)....3572
38.5.388 DMFC General 1 Register (IPU_DMFC_GENERAL_1).... 3574
38.5.389 DMFC General 2 Register (IPU_DMFC_GENERAL_2).... 3576

38.5.390 DMFC IC Interface Control Register (IPU_DMFC_IC_CTRL)....3577
38.5.391 DMFC Write Channel Alternate Register (IPU_DMFC_WR_CHAN_ALT)....3578
38.5.392 DMFC Write Channel Definition Alternate Register (IPU_DMFC_WR_CHAN_DEF_ALT)....3579
38.5.393 DMFC MFC Display Processor Channel Alternate Register (IPU_DMFC_DP_CHAN_ALT)....3580
38.5.394 DMFC Display Channel Definition Alternate Register (IPU_DMFC_DP_CHAN_DEF_ALT)....3583
38.5.395 DMFC General 1 Alternate Register (IPU_DMFC_GENERAL1_ALT)....3585
38.5.396 DMFC Status Register (IPU_DMFC_STAT)....3587
38.5.397 VDI Field Size Register (IPU_VDI_FSIZE)....3588
38.5.398 VDI Control Register (IPU_VDI_C)....3589
38.5.399 VDI Control Register 2 (IPU_VDI_C2_)....3591
38.5.400 VDI Combining Parameters Register 1 (IPU_VDI_CMDP_1)....3592
38.5.401 VDI Combining Parameters Register 2 (IPU_VDI_CMDP_2)....3593
38.5.402 VDI Plane Size Register 1 (IPU_VDI_PS_1)....3593
38.5.403 VDI Plane Size Register 2 (IPU_VDI_PS_2)....3594
38.5.404 VDI Plane Size Register 3 (IPU_VDI_PS_3)....3595
38.5.405 VDI Plane Size Register 4 (IPU_VDI_PS_4)....3595

Chapter 39
Keypad Port (KPP)

39.1 Overview....3597
39.1.1 Features....3599
39.1.2 Modes and Operations....3599
39.2 Clocks....3599
39.3 External Signals....3599
39.3.1 Input Pins....3601
39.3.2 Output Pins....3601
39.3.3 Generation of Transfer Error Signal on Peripheral Bus....3601
39.4 Functional Description....3602
39.4.1 Keypad Matrix Construction....3602
39.4.2 Keypad Port Configuration....3602

39.4.3 Keypad Matrix Scanning ... 3602
39.4.4 Keypad Standby ... 3603
39.4.5 Glitch Suppression on Keypad Inputs ... 3603
39.4.6 Multiple Key Closures ... 3604
39.4.6.1 Ghost Key Problem and Correction ... 3606
39.4.7 3-Point Contact Keys Support ... 3608
39.5 Initialization/Application Information ... 3609
39.5.1 Typical Keypad Configuration and Scanning Sequence ... 3609
39.5.2 Key Press Interrupt Scanning Sequence ... 3610
39.5.3 Additional Comments ... 3610
39.6 KPP Memory Map/Register Definition ... 3610
39.6.1 Keypad Control Register (KPP_KPCR) ... 3611
39.6.2 Keypad Status Register (KPP_KPSR) ... 3612
39.6.3 Keypad Data Direction Register (KPP_KDDR) ... 3613
39.6.4 Keypad Data Register (KPP_KPDR) ... 3614

Chapter 40
LVDS Display Bridge (LDB)

40.1 Overview ... 3617
40.1.1 Relevant Standards ... 3619
40.2 External Signals ... 3619
40.3 Clocks ... 3619
40.4 Input and Output Ports ... 3620
40.4.1 Input Parallel Display Ports ... 3620
40.4.2 Output LVDS Ports ... 3621
40.5 Processing ... 3621
40.5.1 Mapping of Input Data Busses ... 3621
40.5.2 Bit Mapping ... 3622
40.6 LDB Memory Map/Register Definition ... 3622
40.6.1 LDB Control Register (LDB_CTRL) ... 3623

Chapter 41
MIPI - Camera Serial Interface Host Controller (MIPI_CSI)

41.1 Overview....3627

41.2 Features....3627

41.3 Architecture....3628

41.3.1 Startup Sequence....3629

41.3.2 Interrupt mechanism....3631

41.3.3 Signals....3632

41.4 Timing Interfaces....3633

41.4.1 Image Data Interface....3633

41.5 Payload Data Output Format....3638

41.5.1 General/Arbitrary Data Reception....3638

41.5.2 RGB888 Data Reception....3639

41.5.3 RGB666 Data Reception....3640

41.5.4 RGB565 Data Reception....3641

41.5.5 RGB555 Data Reception....3642

41.5.6 RGB444 Data Reception....3643

41.5.7 YUV422 8-bit Data Reception....3643

41.5.8 YUV422 10-bit Data Reception....3644

41.5.9 YUV420 8-bit (Legacy) Data Reception....3645

41.5.10 YUV420 8-bit Data Reception....3646

41.5.11 YUV420 10-bit Data Reception....3647

41.5.12 RAW6 Data Reception....3649

41.5.13 RAW7 Data Reception....3649

41.5.14 RAW8 Data Reception....3650

41.5.15 RAW10 Data Reception....3650

41.5.16 RAW12 Data Reception....3651

41.5.17 RAW14 Data Reception....3652

41.6 MIPI_CSI Memory Map/Register Definition....3653

41.6.1 Controller Version Identification Register (MIPI_CSI_VERSION)....3654
41.6.2 Number of Active Data Lanes (MIPI_CSI_N_LANES)....3655
41.6.3 Phy shutdown control (MIPI_CSI_PHY_SHUTDOWNZ)....3656
41.6.4 Phy reset control (MIPI_CSI_DPHY_RSTZ)....3657
41.6.5 CSI2 controller reset (MIPI_CSI_CSI2_RESETN)....3657
41.6.6 General settings for all blocks (MIPI_CSI_PHY_STATE)....3659
41.6.7 Data IDs for which IDI reports line boundary matching errors (MIPI_CSI_DATA_IDS_1)....3660
41.6.8 Error state register 1 (MIPI_CSI_ERR1)....3662
41.6.9 Error state register 2 (MIPI_CSI_ERR2)....3666
41.6.10 Masks for errors 2 (MIPI_CSI_MASK2)....3668
41.6.11 D-PHY Test interface control 0 (MIPI_CSI_PHY_TST_CRTL0)....3670
41.6.12 D-PHY Test interface control 1 (MIPI_CSI_PHY_TST_CTRL1)....3671

Chapter 42
MIPI DSI Host Controller (MIPI_DSI)

42.1 Overview....3673
42.2 Features....3673
42.2.1 System Overview....3674
42.3 Clocks....3674
42.4 Architecture....3675
42.4.1 Architecture Overview....3675
42.4.2 DBI-2 interface....3676
42.4.3 DPI-2 Interface....3693
42.4.4 Error control and timeout timers....3695
42.4.5 Timeout timers....3695
42.4.6 Error control....3695
42.4.7 Generic packets....3697
42.4.8 Signals....3698
42.5 Programming....3699
42.5.1 DSI and D-PHY initialization sequence....3699

42.6 MIPI_DSI Memory Map/Register Definition....3700
42.6.1 Version of the DSI host ctrl (MIPI_DSI_VERSION).... 3702
42.6.2 Core power up (MIPI_DSI_PWR_UP)....3702
42.6.3 Number of active data lanes (MIPI_DSI_CLKMGR_CFG).... 3703
42.6.4 DPI interface configuration (MIPI_DSI_DPI_CFG)....3703
42.6.5 DBI interface configuration (MIPI_DSI_DBI_CFG).... 3705
42.6.6 DBI command size configuration (MIPI_DSI_DBIS_CMDSIZE).... 3706
42.6.7 Packet handler configuration (MIPI_DSI_PCKHDL_CFG).... 3707
42.6.8 Video Mode Configuration (MIPI_DSI_VID_MODE_CFG).... 3708
42.6.9 Video packet configuration (MIPI_DSI_VID_PKT_CFG).... 3709
42.6.10 Command mode configuration (MIPI_DSI_CMD_MODE_CFG).... 3710
42.6.11 Line timer configuration (MIPI_DSI_TMR_LINE_CFG).... 3712
42.6.12 Vertical timing configuration (MIPI_DSI_VTIMING_CFG).... 3712
42.6.13 D-PHY timing configuration (MIPI_DSI_PHY_TMR_CFG).... 3713
42.6.14 Generic packet Header configuration (MIPI_DSI_GEN_HDR).... 3713
42.6.15 Generic payload data in/out (MIPI_DSI_GEN_PLD_DATA)....3714
42.6.16 Command packet status (MIPI_DSI_CMD_PKT_STATUS).... 3714
42.6.17 Time Out timers configuration (MIPI_DSI_TO_CNT_CFG0)....3716
42.6.18 Interrupt status register 0 (MIPI_DSI_ERROR_ST0)....3716
42.6.19 Interrupt status register 1 (MIPI_DSI_ERROR_ST1)....3718
42.6.20 Masks Interrupt generation trigged by ERROR_ST0 register (MIPI_DSI_ERROR_MSK0).... 3719
42.6.21 Masks Interrupt generation trigged by ERROR_ST1 register (MIPI_DSI_ERROR_MSK1).... 3721
42.6.22 D-PHY reset control (MIPI_DSI_PHY_RSTZ).... 3723
42.6.23 D-PHY interface configuration (MIPI_DSI_PHY_IF_CFG_)....3724
42.6.24 D-PHY PPI interface control (MIPI_DSI_PHY_IF_CTRL)....3724
42.6.25 D-PHY PPI status interface (MIPI_DSI_PHY_STATUS)....3725
42.6.26 D-PHY Test interface control 0 (MIPI_DSI_PHY_TST_CTRL0).... 3727
42.6.27 D-PHY Test interface control 1 (MIPI_DSI_PHY_TST_CTRL1).... 3727

Chapter 43

MIPI HSI Host Controller (MIPI_HSI)

43.1 Overview....3729

43.1.1 Features....3729

43.2 External Signals....3730

43.2.1 External Signals Overview....3730

43.2.2 Ports Table....3731

43.3 Clocks....3731

43.4 Functional Description....3731

43.4.1 DMA AHB /PIO AHB slave and Data Channel Buffer....3732

43.4.1.1 AHB Slave Interface....3733

43.4.1.2 AHB Master Interface....3734

43.4.1.3 Control Registers....3734

43.4.1.4 DMA Engine....3734

43.4.1.5 Rx/Tx FIFO controller....3734

43.4.1.6 Arbiter....3734

43.4.1.7 4K Bytes Dual Port RAM....3734

43.4.1.8 Typical Software Operation Flow for DMA....3734

43.4.1.9 Typical Software Operation Flow 1 for Data Port....3735

43.4.1.10 Typical Software Operation Flow 2 for Data Port....3735

43.4.2 HSI Reset....3735

43.5 HSI Memory Map/Register Definition....3735

43.5.1 HSI Control Register (MIPI_HSI_CTRL)....3742

43.5.2 HSI Tx Config Register (MIPI_HSI_TX_CONF)....3744

43.5.3 HSI Rx Config Register (MIPI_HSI_RX_CONF)....3746

43.5.4 HSI Capability Register (MIPI_HSI_CAP)....3749

43.5.5 HSI Tx Water Mark Level 0 Register (MIPI_HSI_TX_WML0)....3750

43.5.6 HSI Tx Water Mark Level 1 Register (MIPI_HSI_TX_TML1)....3752

43.5.7 HSI Tx Arbiter Priority 0 Register (MIPI_HSI_TX_ARB_PRI0)....3754

43.5.8 HSI Tx Arbiter Priority 1 Register (MIPI_HSI_TX_ARB_PRI1)....3756

43.5.9 HSI Line Status Register (MIPI_HSI_LINE_ST)..... 3759
43.5.10 HSI ID Bits Register (MIPI_HSI_ID_BIT)..... 3761
43.5.11 Tx and Rx Fif0 Threshold Configuration Register (MIPI_HSI_FIFO_THR_CONF)..... 3762
43.5.12 Tx and Rx Channel Soft Reset Register (MIPI_HSI_CH_SFTRST)..... 3765
43.5.13 HSI Interrupt Status Register (MIPI_HSI_IRQSTAT)..... 3767
43.5.14 HSI Interrupt Status Enable Register (MIPI_HSI_IRQSTAT_EN)..... 3769
43.5.15 HSI Interrupt Signal Enable Register (MIPI_HSI_IRQSIG_EN)..... 3771
43.5.16 HSI FIFO Threshold Interrupt Status Register (MIPI_HSI_FIFO_THR_IRQSTAT)..... 3773
43.5.17 HSI FIFO Threshold Interrupt Status Enable Register (MIPI_HSI_FIFO_THR_IRQSTAT_EN)..... 3776
43.5.18 HSI FIFO Threshold Interrupt Signal Enable Register (MIPI_HSI_FIFO_THR_IRQSIG_EN)..... 3779
43.5.19 Tx Channel n Data Port Register (MIPI_HSI_TX_CH*n*_DP)..... 3782
43.5.20 Rx Channel n Data Port Register (MIPI_HSI_RX_CH*n*_DP)..... 3783
43.5.21 HSI Error Interrupt Status Register (MIPI_HSI_ERR_IRQSTAT)..... 3784
43.5.22 HSI Error Interrupt Status Enable Register (MIPI_HSI_ERR_IRQSTAT_EN)..... 3787
43.5.23 HSI Error Interrupt Signal Enable Register (MIPI_HSI_ERR_IRQSIG_EN)..... 3789
43.5.24 Tx DMA Channel n Configuration Register (MIPI_HSI_TDMA*n*_CONF)..... 3791
43.5.25 Rx DMA Channel n Configuration Register (MIPI_HSI_RDMA*n*_CONF)..... 3792
43.5.26 Tx DMA Channel n Start Address Register (MIPI_HSI_TDMA*n*_STA_ADDR)..... 3793
43.5.27 Rx DMA Channel n Start Address Register (MIPI_HSI_RDMA*n*_STA_ADDR)..... 3793
43.5.28 DMA Interrupt Status Register (MIPI_HSI_DMA_IRQSTAT)..... 3794
43.5.29 DMA Interrupt Enable Register (MIPI_HSI_DMA_IRQSTAT_EN)..... 3796
43.5.30 DMA Interrupt Status Signal Enable Register (MIPI_HSI_DMA_IRQSIG_EN)..... 3798
43.5.31 DMA Error Interrupt Status Register (MIPI_HSI_DMA_ERR_IRQSTAT)..... 3801
43.5.32 DMA Error Interrupt Enable Register (MIPI_HSI_DMA_ERR_IRQSTAT_EN)..... 3803
43.5.33 DMA Error Interrupt Signal Enable Register (MIPI_HSI_DMA_ERR_IRQSIG_EN)..... 3805
43.5.34 DMA Single Request Enable Register (MIPI_HSI_DMA_SINGLE_REQ_EN)..... 3808
43.5.35 Tx Fifo Size Configuration Register 0 (MIPI_HSI_TX_FIFO_SIZE_CONF0)..... 3810
43.5.36 Tx Fifo Size Configuration Register 1 (MIPI_HSI_TX_FIFO_SIZE_CONF1)..... 3813
43.5.37 Rx Fifo Size Configuration Register 0 (MIPI_HSI_RX_FIFO_SIZE_CONF0)..... 3816

43.5.38 Rx Fifo Size Configuration Register 1 (MIPI_HSI_RX_FIFO_SIZE_CONF1)....3819
43.5.39 Tx Fifo Status Register (MIPI_HSI_TX_FIFO_STAT)....3822
43.5.40 Rx Fifo Status Register (MIPI_HSI_RX_FIFO_STAT)....3824
43.5.41 AHB Master Config Register (MIPI_HSI_AHB_MASTER_CONF)....3826
43.5.42 TX Break Length Register (MIPI_HSI_TX_BREAK_LEN)....3827

Chapter 44
MediaLB (MLB)

44.1 Overview....3829
44.1.1 Block Diagram....3829
44.1.1.1 Bus Interfaces....3830
44.2 External Signals....3831
44.3 Clocks....3831
44.4 Functional Description....3832
44.4.1 MediaLB Block....3832
44.4.1.1 MediaLB Channel Address to Logical Channel Mapping....3833
44.4.2 Host Bus Interface Block....3833
44.4.2.1 HBI Physical Addresses....3833
44.4.3 Routing Fabric Block....3834
44.4.3.1 Data Buffer RAM....3834
44.4.3.1.1 Synchronous Channels....3834
44.4.3.1.2 Isochronous Channels....3835
44.4.3.1.3 Asynchronous and Control Channels....3835
44.4.3.2 Channel Table RAM....3835
44.4.3.2.1 Address Mapping....3835
44.4.3.2.2 Channel Allocation Table....3836
44.4.3.2.2.1 Channel Setup....3837
44.4.3.2.3 Channel Descriptor Table....3838
44.4.3.2.3.1 Synchronous Channel Operation....3838
44.4.3.2.3.2 Synchronous Channel Descriptors....3839

44.4.3.2.3.3 Isochronous Channel Descriptors....3841
44.4.3.2.3.4 Asynchronous and Control Channel Descriptors....3842
44.4.4 Memory Interface Block....3844
44.4.4.1 CTR Access....3844
44.4.4.1.1 Direct CTR Writes....3845
44.4.4.1.2 Direct CTR Reads....3845
44.4.4.1.3 CTR Addressing....3846
44.4.4.2 DBR Access....3846
44.4.4.2.1 Direct DBR Writes....3847
44.4.4.2.2 Direct DBR Reads....3847
44.4.5 Interrupt Interface Block....3847
44.4.6 AMBA AHB Block....3848
44.4.6.1 AHB Descriptor Table....3848
44.4.6.2 AHB Synchronous Channel Descriptors....3850
44.4.6.3 AHB Isochronous Channel Descriptors....3850
44.4.6.4 AHB Asynchronous and Control Channel Descriptors....3851
44.4.6.4.1 Single-packet Mode....3851
44.4.6.4.2 Multiple-packet Mode....3853
44.5 Software Flow....3854
44.5.1 Channel Initialization....3855
44.5.1.1 Configure the Hardware....3855
44.5.1.2 Program the Routing Fabric Block....3855
44.5.1.3 Program the AMBA AHB Block DMAs....3856
44.5.1.4 Synchronize and Unmute Synchronous Channel....3858
44.5.2 Channel Servicing....3858
44.5.2.1 Servicing the AMBA AHB Block (DMA) Interrupts....3858
44.5.2.2 Servicing the MediaLB Interrupts....3859
44.5.2.3 Polling for MediaLB System Commands....3859
44.5.3 Low Power Mode....3860

44.6 MLB150 Memory Map/Register Definition....3860
44.6.1 MediaLB Control 0 Register (MLB_MLBC0)....3863
44.6.2 MediaLB 6-pin Control 0 Register (MLB_MLBPC0)....3866
44.6.3 MediaLB Channel Status 0 Register (MLB_MS0)....3866
44.6.4 MediaLB 6-pin Control 2 Register (MLB_MLBPC2)....3867
44.6.5 MediaLB Channel Status1 Register (MLB_MS1)....3868
44.6.6 MediaLB System Status Register (MLB_MSS)....3869
44.6.7 MediaLB System Data Register (MLB_MSD)....3870
44.6.8 MediaLB Interrupt Enable Register (MLB_MIEN)....3871
44.6.9 MediaLB 6-pin Control 1 Register (MLB_MLBPC1)....3872
44.6.10 MediaLB Control 1 Register (MLB_MLBC1)....3873
44.6.11 HBI Control Register (MLB_HCTL)....3874
44.6.12 HBI Channel Mask 0 Register (MLB_HCMR0)....3875
44.6.13 HBI Channel Mask 1 Register (MLB_HCMR1)....3875
44.6.14 HBI Channel Error 0 Register (MLB_HCER0)....3876
44.6.15 HBI Channel Error 1 Register (MLB_HCER1)....3876
44.6.16 HBI Channel Busy 0 Register (MLB_HCBR0)....3877
44.6.17 HBI Channel Busy 1 Register (MLB_HCBR1)....3877
44.6.18 MIF Data 0 Register (MLB_MDAT0)....3878
44.6.19 MIF Data 1 Register (MLB_MDAT1)....3878
44.6.20 MIF Data 2 Register (MLB_MDAT2)....3878
44.6.21 MIF Data 3 Register (MLB_MDAT3)....3879
44.6.22 MIF Data Write Enable 0 Register (MLB_MDWE0)....3879
44.6.23 MIF Data Write Enable 1 Register (MLB_MDWE1)....3879
44.6.24 MIF Data Write Enable 2 Register (MLB_MDWE2)....3880
44.6.25 MIF Data Write Enable 3 Register (MLB_MDWE3)....3880
44.6.26 MIF Control Register (MLB_MCTL)....3881
44.6.27 MIF Address Register (MLB_MADR)....3881
44.6.28 AHB Control Register (MLB_ACTL)....3882

44.6.29 AHB Channel Status 0 Register (MLB_ACSR0)....3883
44.6.30 AHB Channel Status 1 Register (MLB_ACSR1)....3884
44.6.31 AHB Channel Mask 0 Register (MLB_ACMR0)....3884
44.6.32 AHB Channel Mask 1 Register (MLB_ACMR1)....3885

Chapter 45
Multi Mode DDR Controller (MMDC)

45.1 Overview....3887
45.1.1 MMDC feature summary....3889
45.2 External Signals....3891
45.3 Clocks....3891
45.4 Functional Description....3892
45.4.1 Write/Read data flow....3892
45.4.1.1 Write data flow....3892
45.4.1.2 Read data flow....3893
45.4.2 MMDC initialization....3893
45.4.3 Configuring the MMDC registers....3895
45.4.4 MMDC Address Space....3895
45.4.4.1 Address decoding....3895
45.4.4.2 Chip select settings....3898
45.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density....3898
45.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density....3899
45.4.4.3 Translation of AXI accesses to DDR accessess....3900
45.4.4.3.1 Example 1....3900
45.4.4.3.2 Example 2....3900
45.4.4.3.3 Example 3....3901
45.4.4.3.4 Example 4....3902
45.4.4.3.5 Example 5....3902
45.4.4.4 Address mirroring....3903
45.4.5 LPDDR2 and DDR3 pin mux mapping....3904

45.4.6 Power Saving and Clock Frequency Change modes ... 3905
45.4.6.1 Power saving general ... 3905
45.4.6.2 Self refresh and Frequency change entry/exit ... 3906
45.4.7 Reset ... 3908
45.4.7.1 Hard reset ... 3908
45.4.7.2 Warm reset ... 3908
45.4.7.3 Software reset ... 3909
45.4.8 Refresh Scheme ... 3909
45.4.9 Burst Length options towards DDR ... 3910
45.4.10 Exclusive accesses handling ... 3910
45.4.11 AXI Error Handling ... 3912
45.5 Performance ... 3912
45.5.1 Arbitration and reordering mechanism ... 3912
45.5.1.1 Arbitration General ... 3912
45.5.1.2 Real time channel mode ... 3913
45.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions) ... 3913
45.5.1.4 Guarding (aging) mechanism ... 3914
45.5.2 Prediction mechanism ... 3914
45.5.3 Special Optimization for accesses towards DDR3 ... 3915
45.6 MMDC Debug ... 3916
45.6.1 Hardware debug monitor ... 3916
45.6.2 Step By Step (SBS) software monitor ... 3916
45.7 MMDC Profiling ... 3917
45.8 LPDDR2 Refresh Rate Update and Timing Derating ... 3919
45.9 DLL Switching ... 3920
45.9.1 DLL Off mode ... 3920
45.10 ODT Configuration ... 3921
45.11 Calibration Process ... 3923
45.11.1 Delay-line ... 3924

45.11.2 ZQ calibration 3924
45.11.2.1 ZQ automatic (hardware) calibration process..... 3925
45.11.2.1.1 ZQ automatic Pull-up calibration..... 3926
45.11.2.1.2 ZQ automatic Pull-down calibration..... 3926
45.11.2.2 ZQ software calibration process..... 3926
45.11.2.3 ZQ calibration commands 3927
45.11.3 Read DQS Gating Calibration..... 3927
45.11.3.1 Hardware DQS Gating Calibration..... 3927
45.11.3.1.1 Hardware DQS Calibration with MPR..... 3928
45.11.3.1.2 Hardware DQS Calibration with pre-defined value..... 3928
45.11.3.2 SW read DQS gating Calibration..... 3931
45.11.3.2.1 SW read Calibration with MPR..... 3931
45.11.3.2.2 SW read Calibration with pre-defined value..... 3931
45.11.4 Read Calibration..... 3933
45.11.4.1 Hardware (automatic) Read Calibration..... 3934
45.11.4.1.1 Hardware (automatic) Calibration with MPR/DQ Calibration..... 3934
45.11.4.1.2 Hardware (automatic) Calibration with pre-defined value..... 3934
45.11.4.2 SW Read Calibration..... 3936
45.11.4.2.1 Calibration with MPR/DQ calibration..... 3936
45.11.4.2.2 Calibration with pre-defined value..... 3936
45.11.5 Write Calibration..... 3938
45.11.5.1 HW (automatic) Write Calibration..... 3938
45.11.5.2 SW Write Calibration..... 3940
45.11.6 Write leveling Calibration..... 3941
45.11.6.1 Hardware Write Leveling Calibration..... 3942
45.11.6.2 SW Write Leveling Calibration..... 3944
45.11.7 Write fine tuning..... 3945
45.11.8 Read fine tuning..... 3945
45.11.9 ZQ Fine Tuning..... 3945

45.11.10 Duty cycle adjustment....3946
45.12 MMDC Memory Map/Register Definition....3946
45.12.1 MMDC Core Control Register (MMDC*x*_MDCTL)....3957
45.12.2 MMDC Core Power Down Control Register (MMDC*x*_MDPDC)....3959
45.12.3 MMDC Core ODT Timing Control Register (MMDC*x*_MDOTC)....3961
45.12.4 MMDC Core Timing Configuration Register 0 (MMDC*x*_MDCFG0)....3963
45.12.5 MMDC Core Timing Configuration Register 1 (MMDC*x*_MDCFG1)....3965
45.12.6 MMDC Core Timing Configuration Register 2 (MMDC*x*_MDCFG2)....3967
45.12.7 MMDC Core Miscellaneous Register (MMDC*x*_MDMISC)....3969
45.12.8 MMDC Core Special Command Register (MMDC*x*_MDSCR)....3972
45.12.9 MMDC Core Refresh Control Register (MMDC*x*_MDREF)....3975
45.12.10 MMDC Core Read/Write Command Delay Register (MMDC*x*_MDRWD)....3978
45.12.11 MMDC Core Out of Reset Delays Register (MMDC*x*_MDOR)....3980
45.12.12 MMDC Core MRR Data Register (MMDC*x*_MDMRR)....3981
45.12.13 MMDC Core Timing Configuration Register 3 (MMDC*x*_MDCFG3LP)....3982
45.12.14 MMDC Core MR4 Derating Register (MMDC*x*_MDMR4)....3983
45.12.15 MMDC Core Address Space Partition Register (MMDC*x*_MDASP)....3985
45.12.16 MMDC Core AXI Reordering Control Register (MMDC*x*_MAARCR)....3986
45.12.17 MMDC Core Power Saving Control and Status Register (MMDC*x*_MAPSR)....3988
45.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDC*x*_MAEXIDR0)....3991
45.12.19 MMDC Core Exclusive ID Monitor Register1 (MMDC*x*_MAEXIDR1)....3991
45.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDC*x*_MADPCR0)....3992
45.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDC*x*_MADPCR1)....3994
45.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDC*x*_MADPSR0)....3994
45.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDC*x*_MADPSR1)....3995
45.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDC*x*_MADPSR2)....3995
45.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDC*x*_MADPSR3)....3996
45.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDC*x*_MADPSR4)....3996
45.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDC*x*_MADPSR5)....3997

45.12.28 MMDC Core Step By Step Address Register (MMDC*x*_MASBS0)..... 3997
45.12.29 MMDC Core Step By Step Address Attributes Register (MMDC*x*_MASBS1)..... 3998
45.12.30 MMDC Core General Purpose Register (MMDC*x*_MAGENP)..... 3999
45.12.31 MMDC PHY ZQ HW control register (MMDC*x*_MPZQHWCTRL).....4000
45.12.32 MMDC PHY ZQ SW control register (MMDC*x*_MPZQSWCTRL).....4002
45.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDC*x*_MPWLGCR).....4004
45.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDC*x*_MPWLDECTRL0).....4007
45.12.35 MMDC PHY Write Leveling Delay Control Register 1 (MMDC*x*_MPWLDECTRL1).....4009
45.12.36 MMDC PHY Write Leveling delay-line Status Register (MMDC*x*_MPWLDLST)..... 4012
45.12.37 MMDC PHY ODT control register (MMDC*x*_MPODTCTRL)..... 4014
45.12.38 MMDC PHY Read DQ Byte0 Delay Register (MMDC*x*_MPRDDQBY0DL)..... 4016
45.12.39 MMDC PHY Read DQ Byte1 Delay Register (MMDC*x*_MPRDDQBY1DL)..... 4019
45.12.40 MMDC PHY Read DQ Byte2 Delay Register (MMDC*x*_MPRDDQBY2DL)..... 4021
45.12.41 MMDC PHY Read DQ Byte3 Delay Register (MMDC*x*_MPRDDQBY3DL)..... 4024
45.12.42 MMDC PHY Write DQ Byte0 Delay Register (MMDC*x*_MPWRDQBY0DL).....4027
45.12.43 MMDC PHY Write DQ Byte1 Delay Register (MMDC*x*_MPWRDQBY1DL).....4029
45.12.44 MMDC PHY Write DQ Byte2 Delay Register (MMDC*x*_MPWRDQBY2DL).....4031
45.12.45 MMDC PHY Write DQ Byte3 Delay Register (MMDC*x*_MPWRDQBY3DL).....4033
45.12.46 MMDC PHY Read DQS Gating Control Register 0 (MMDC*x*_MPDGCTRL0)..... 4036
45.12.47 MMDC PHY Read DQS Gating Control Register 1 (MMDC*x*_MPDGCTRL1)..... 4038
45.12.48 MMDC PHY Read DQS Gating delay-line Status Register (MMDC*x*_MPDGDLST0)..... 4040
45.12.49 MMDC PHY Read delay-lines Configuration Register (MMDC*x*_MPRDDLCTL)..... 4042
45.12.50 MMDC PHY Read delay-lines Status Register (MMDC*x*_MPRDDLST).....4043
45.12.51 MMDC PHY Write delay-lines Configuration Register (MMDC*x*_MPWRDLCTL)..... 4044
45.12.52 MMDC PHY Write delay-lines Status Register (MMDC*x*_MPWRDLST).....4046
45.12.53 MMDC PHY CK Control Register (MMDC*x*_MPSDCTRL).....4047
45.12.54 MMDC ZQ LPDDR2 HW Control Register (MMDC*x*_MPZQLP2CTL).....4048
45.12.55 MMDC PHY Read Delay HW Calibration Control Register (MMDC*x*_MPRDDLHWCTL)..... 4049
45.12.56 MMDC PHY Write Delay HW Calibration Control Register (MMDC*x*_MPWRDLHWCTL)..... 4051

45.12.57 MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC*x*_MPRDDLHWST0)..... 4053
45.12.58 MMDC PHY Read Delay HW Calibration Status Register 1 (MMDC*x*_MPRDDLHWST1)..... 4054
45.12.59 MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC*x*_MPWRDLHWST0).....4055
45.12.60 MMDC PHY Write Delay HW Calibration Status Register 1 (MMDC*x*_MPWRDLHWST1).....4056
45.12.61 MMDC PHY Write Leveling HW Error Register (MMDC*x*_MPWLHWERR).....4057
45.12.62 MMDC PHY Read DQS Gating HW Status Register 0 (MMDC*x*_MPDGHWST0)..... 4057
45.12.63 MMDC PHY Read DQS Gating HW Status Register 1 (MMDC*x*_MPDGHWST1)..... 4058
45.12.64 MMDC PHY Read DQS Gating HW Status Register 2 (MMDC*x*_MPDGHWST2)..... 4059
45.12.65 MMDC PHY Read DQS Gating HW Status Register 3 (MMDC*x*_MPDGHWST3)..... 4059
45.12.66 MMDC PHY Pre-defined Compare Register 1 (MMDC*x*_MPPDCMPR1)..... 4060
45.12.67 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC*x*_MPPDCMPR2).....4061
45.12.68 MMDC PHY SW Dummy Access Register (MMDC*x*_MPSWDAR0).....4062
45.12.69 MMDC PHY SW Dummy Read Data Register 0 (MMDC*x*_MPSWDRDR0).....4064
45.12.70 MMDC PHY SW Dummy Read Data Register 1 (MMDC*x*_MPSWDRDR1).....4065
45.12.71 MMDC PHY SW Dummy Read Data Register 2 (MMDC*x*_MPSWDRDR2).....4065
45.12.72 MMDC PHY SW Dummy Read Data Register 3 (MMDC*x*_MPSWDRDR3).....4066
45.12.73 MMDC PHY SW Dummy Read Data Register 4 (MMDC*x*_MPSWDRDR4).....4066
45.12.74 MMDC PHY SW Dummy Read Data Register 5 (MMDC*x*_MPSWDRDR5).....4067
45.12.75 MMDC PHY SW Dummy Read Data Register 6 (MMDC*x*_MPSWDRDR6).....4067
45.12.76 MMDC PHY SW Dummy Read Data Register 7 (MMDC*x*_MPSWDRDR7).....4068
45.12.77 MMDC PHY Measure Unit Register (MMDC*x*_MPMUR0).....4068
45.12.78 MMDC Write CA delay-line controller (MMDC*x*_MPWRCADL).....4069
45.12.79 MMDC Duty Cycle Control Register (MMDC*x*_MPDCCR)..... 4071

Chapter 46
Network Interconnect Bus System (NIC-301)

46.1 Overview 4075
46.1.1 Block diagram..... 4075
46.1.2 NIC-301 Main Features..... 4076

46.1.3 Modes and Operations 4077
46.2 External Signals 4077
46.3 Memory Map and Register Definition 4077
46.3.1 Memory Map 4077
46.3.2 Configuration programmers model 4078
46.3.2.1 Address control and ID registers 4078
46.3.2.2 AMBA master interface block (AMIB) configuration registers 4079
46.3.2.3 ASIB (AMBA slave interface block) configuration registers 4079
46.3.3 Register Descriptions 4079
46.3.3.1 QoS registers' address look-up example 4080
46.3.4 NIC-specific parameters 4080

Chapter 47
On-Chip OTP Controller (OCOTP_CTRL)

47.1 Overview 4083
47.1.1 Features 4083
47.2 Clocks 4083
47.3 Top-Level Symbol and Functional Overview 4084
47.3.1 Operation 4084
47.3.1.1 Shadow Register Reload 4085
47.3.1.2 Fuse and Shadow Register Read 4085
47.3.1.3 Fuse and Shadow Register Writes 4086
47.3.1.4 Write Postamble 4087
47.3.2 Fuse Shadow Memory Footprint 4088
47.3.3 OTP Read/Write Timing Parameters 4089
47.3.4 Hardware Visible Fuses 4090
47.3.5 Behavior During Reset 4091
47.4 Fuse Map 4091
47.5 OCOTP Memory Map/Register Definition 4091
47.5.1 OTP Controller Control Register (OCOTP_CTRL*n*) 4094

47.5.2 OTP Controller Timing Register (OCOTP_TIMING)..... 4096
47.5.3 OTP Controller Write Data Register (OCOTP_DATA)..... 4096
47.5.4 OTP Controller Write Data Register (OCOTP_READ_CTRL)..... 4097
47.5.5 OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)..... 4098
47.5.6 Sticky bit Register (OCOTP_SW_STICKY)..... 4098
47.5.7 Software Controllable Signals Register (OCOTP_SCS*n*)..... 4099
47.5.8 OTP Controller Version Register (OCOTP_VERSION)..... 4100
47.5.9 Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)..... 4101
47.5.10 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)..... 4104
47.5.11 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)..... 4105
47.5.12 Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2)..... 4105
47.5.13 Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)..... 4106
47.5.14 Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)..... 4106
47.5.15 Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)..... 4107
47.5.16 Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6)..... 4107
47.5.17 Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0)..... 4108
47.5.18 Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1)..... 4108
47.5.19 Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2)..... 4109
47.5.20 Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3)..... 4109
47.5.21 Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4)..... 4110
47.5.22 Value of OTP Bank1 Word5 (General Purpose Customer Defined Info.) (OCOTP_ANA0)..... 4110
47.5.23 Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1)..... 4111
47.5.24 Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2)..... 4111
47.5.25 Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0)..... 4112
47.5.26 Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1)..... 4112
47.5.27 Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2)..... 4113
47.5.28 Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3)..... 4113
47.5.29 Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4)..... 4114
47.5.30 Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5)..... 4114

47.5.31 Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6)..... 4115
47.5.32 Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7)..... 4115
47.5.33 Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_SJC_RESP0)..... 4116
47.5.34 Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_SJC_RESP1)..... 4116
47.5.35 Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0)..... 4117
47.5.36 Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1)..... 4117
47.5.37 Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1)..... 4118
47.5.38 Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2)..... 4118
47.5.39 Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF)..... 4119
47.5.40 Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN)..... 4119
47.5.41 Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE)..... 4120

Chapter 48
On-Chip RAM Memory Controller (OCRAM)

48.1 Overview..... 4121
48.2 Basic Functions..... 4122
48.2.1 Memory Map..... 4122
48.2.2 Read/Write Arbitration..... 4123
48.3 Advanced Features..... 4123
48.3.1 Read Data Wait State..... 4123
48.3.2 Read Address Pipeline..... 4124
48.3.3 Write Data Pipeline..... 4124
48.3.4 Write Address Pipeline..... 4124
48.4 Programmable Registers..... 4125

Chapter 49
PCI Express (PCIe)

49.1 Overview..... 4127
49.1.1 Terms and Abbreviations..... 4127
49.2 Architecture..... 4129
49.2.1 Common Xpress Port Logic (CXPL)..... 4131

49.2.2 Transmit Application-Dependent Module (XADM)..... 4132
49.2.2.1 Arbitration..... 4133
49.2.2.2 Credit Checking..... 4134
49.2.3 Receive Application-Dependent Module (RADM)..... 4134
49.2.3.1 Posted and Non-Posted Request and Completion TLP Processing..... 4135
49.2.3.1.1 TLP Routing..... 4136
49.2.3.2 Received Completion TLP Processing..... 4136
49.2.3.3 Message Processing..... 4137
49.2.4 Configuration-Dependent Module (CDM)..... 4137
49.2.5 Local Bus Controller (LBC) and Data bus Interface (DBI)..... 4138
49.2.5.1 Overview (LBC)..... 4138
49.2.5.1.1 Simultaneous Transactions..... 4140
49.2.5.2 ELBI..... 4140
49.2.5.3 CDM Register Space Layout..... 4140
49.2.5.3.1 PCI Configuration Header and Capability Registers (in CDM)..... 4142
49.2.5.3.2 Port Logic (PL) Registers (in CDM)..... 4142
49.2.5.3.3 Memory Mapping PL Registers..... 4142
49.2.5.4 PCIe Wire Access (EP mode)..... 4143
49.2.5.5 PCIe Wire Access (RC mode)..... 4144
49.3 Core Operations..... 4145
49.3.1 Initialization..... 4145
49.3.2 Link Establishment..... 4146
49.3.3 Transmit TLP Processing..... 4147
49.3.3.1 Transmit Overview..... 4148
49.3.3.2 Transmit TLP Arbitration..... 4148
49.3.3.2.1 Client-Based Arbitration..... 4149
49.3.3.3 Transmit Retry..... 4149
49.3.3.4 Transmit DLLP Priorities..... 4150
49.3.4 Receive TLP Processing..... 4150

49.3.4.1 Receive Overview....4150
49.3.4.2 Receive Filtering....4151
49.3.4.2.1 Filtering Rules Applicable for all TLPs Received....4152
49.3.4.2.2 Filtering Rules Based on TLP Type Defined in PCIe Specification....4153
49.3.4.2.2.1 EP Mode Filtering Rules....4154
49.3.4.2.2.2 RC Mode Filtering Rules....4155
49.3.4.2.3 Filtering Rules Not Defined in PCIe Specification....4156
49.3.4.3 Receive Routing....4157
49.3.4.3.1 EP Mode....4157
49.3.4.3.2 RC mode....4159
49.3.4.3.3 ECRC Handling....4160
49.3.4.3.4 Request TLP Routing Rules....4160
49.3.4.3.5 Completion TLP Routing Rules....4162
49.3.4.4 Receive Queuing....4163
49.3.4.4.1 Queuing Architecture....4164
49.3.4.4.1.1 SEGMENTED-BUFFER RECEIVE QUEUE CONFIGURATION (CX_RADMQ_MODE=2)....4164
49.3.4.4.2 Queue Modes....4165
49.3.4.4.3 Order Enforcement....4166
49.3.4.4.4 Queue to Port Mapping....4166
49.3.5 Error Handling....4167
49.3.5.1 Error Handling Overview....4167
49.3.5.2 PCIe Baseline Capability....4168
49.3.5.3 Advanced Error Reporting (AER)....4168
49.3.5.3.1 Advisory Non-Fatal Error Messages....4169
49.3.5.4 Error Source Classification....4170
49.3.5.5 Error Detection....4171
49.3.5.6 Application Error Reporting Interface....4173
49.3.5.7 Handling of General Errors with the AXI Bridge....4174

49.3.5.8 AXI....4174
49.3.5.9 Handling of ECRC/LCRC Errors for IO/MEM with the AXI Bridge....4174
49.3.5.9.1 Link CRC (LCRC) - a correctable Error....4174
49.3.5.9.2 End-to-end CRC (ECRC) - an Uncorrectable Non-Fatal Error....4175
49.3.6 Messages....4175
49.3.6.1 Message Generation....4176
49.3.6.1.1 Vendor Defined Message (VDM) Generation....4179
49.3.6.1.1.1 Application Msg/MsgD Programming Examples....4179
49.3.6.1.2 AHB/AXI Message Address and Size Limitations....4180
49.3.6.2 Message Reception....4181
49.3.6.2.1 Message Reception IO Interfaces....4183
49.3.6.2.2 Routing of Received Messages to SII and optionally to Application....4184
49.3.6.2.3 Accessing Header and Payload Fields of Received Messages....4185
49.3.7 Interrupts....4186
49.3.7.1 Interrupts Overview....4186
49.3.7.1.1 PCI Legacy Interrupt....4187
49.3.7.1.2 MSI....4188
49.3.7.1.3 MSI-X....4190
49.3.7.2 Interrupts (EP Mode)....4192
49.3.7.3 Interrupts (RC Mode)....4193
49.3.7.4 MSI Generation in the AXI Bridge....4194
49.3.7.5 MSI Reception in the AHB/AXI Bridge....4194
49.3.7.5.1 AHB/AXI MSI Controller (Optional in RC mode)....4194
49.3.7.5.2 Programming and Usage Model....4196
49.3.8 Flow Control....4199
49.3.9 Address Translation....4200
49.3.9.1 Internal Address Translation (iATU)....4202
49.3.9.1.1 Outbound (TX) Features....4202
49.3.9.1.2 Inbound (RX) Features....4203

49.3.9.1.3 Programming (iATU)....4203
49.3.9.2 Outbound iATU Operation....4204
49.3.9.2.1 Inbound iATU Operation....4209
49.3.9.3 Overview (iATU)....4209
49.3.10 Gen2 5.0 GT/s Operation....4216
49.3.10.1 Overview (Gen2 5.0 GT/s)....4216
49.3.10.2 Speed Changing....4216
49.3.11 Power Management....4217
49.3.11.1 L0s Power Down....4219
49.3.11.2 L1 Power Down....4220
49.3.12 Completion Timeout Ranges....4222
49.4 AXI Bridge Module....4222
49.4.1 Product Overview....4223
49.4.1.1 Overview....4223
49.4.1.2 Interfaces....4224
49.4.1.3 Features List....4225
49.4.1.4 Limitations....4226
49.4.2 Bridge Architecture....4227
49.4.2.1 Bridge Architecture Overview....4227
49.4.2.1.1 Inbound Processing Module Chain....4228
49.4.2.1.2 Outbound Processing Module Chain....4229
49.4.2.2 Decomposition....4230
49.4.2.3 Bridge Buffering....4230
49.4.2.4 Outbound Bridge Tag Management....4232
49.4.2.5 Inbound Bridge Tag Management....4234
49.4.2.6 Inbound Order Enforcement for AXI Bridge....4236
49.4.2.6.1 Ordering Enforcement Hardware Lock Feature....4237
49.4.2.6.2 Re-Ordering Effects of AXI Fabric....4238
49.4.2.6.2.1 Inbound Ordering Limitation....4239

49.4.2.6.3 Additional Information (ordering)....4239
49.4.2.6.4 PCIe Completion Reordering....4240
49.4.2.6.5 Outbound Ordering Limitation #1....4240
49.4.2.6.6 Outbound Ordering Limitation #2....4241
49.4.2.6.7 Additional Information (AXI bridge bandwidth)....4241
49.4.3 PCIe AXI Core Operations....4241
49.4.3.1 AXI Sideband (Misc. Bus) Signals....4241
49.4.3.2 Supported AXI Transfer Type....4242
49.4.3.3 Supported AXI Burst Operations....4242
49.4.3.4 I/O and CFG Transaction Handling over AXI Bridge....4242
49.4.3.4.1 Outbound I/O and CFG Transaction Handling....4243
49.4.3.4.1.1 Method I: Address Translation Method of Sending an Outbound IO or CFG Transfer....4243
49.4.3.4.2 Inbound I/O and CFG Transaction Handling....4243
49.4.4 Additional AXI Reference Material....4244
49.4.4.1 AXI Decomposition Rules....4244
49.4.4.1.1 Outbound Decomposition....4244
49.4.4.1.1.1 Decomposition Side-Effects....4246
49.4.4.1.1.2 Reducing Outbound Decomposition....4246
49.4.4.1.2 Inbound Decomposition....4246
49.4.4.1.2.1 Reducing Inbound Decomposition....4247
49.5 App Note: Order Enforcement Using the PCIe Core....4248
49.5.1 PCIe Ordering Rule Overview....4248
49.5.2 PCIe Core Inbound Order Enforcement....4249
49.5.2.1 Single queue....4249
49.5.2.2 Multiple queue....4250
49.5.2.3 Segmented buffer queue....4251
49.5.3 PCIe Core Outbound Order Enforcement....4252
49.5.4 PCIe AHB/AXI Bridge Order Enforcement....4254

49.5.5 Additional Information.... 4254
49.6 App Note: Calculating Gen1 PCI Express and AXI Bridge Throughput.... 4254
49.6.1 PCI Express Throughput.... 4255
49.6.2 Effective Throughput.... 4255
49.6.2.1 Effective Throughput Calculation.... 4255
49.6.2.1.1 Packet Level: (Start and End, Link CRC, Header).... 4255
49.6.2.1.2 Link Layer: (Flow Control and ACK/NAK DLLPs).... 4256
49.6.2.2 Other Factors Impacting Throughput.... 4257
49.7 PCIe Registers (EP mode).... 4258
49.7.1 Register Space Layout (EP mode).... 4258
49.7.2 PF Register Maps.... 4259
49.7.2.1 PF PCI Configuration Space Header - Type 0.... 4260
49.7.2.2 PF PCI Standard Capability Structures Register Maps.... 4260
49.7.2.3 PF PCI Express Extended Capability Register Maps.... 4262
49.7.3 VF Register Maps.... 4264
49.7.3.1 VF PCI Configuration Space Header - Type 0.... 4264
49.7.3.2 VF PCI Standard Capability Structures Register Maps.... 4264
49.7.4 Accessing Configuration Registers.... 4265
49.8 PCIe Registers (RC mode).... 4267
49.8.1 Register Space Layout.... 4267
49.8.2 Register Maps.... 4268
49.8.2.1 PCI Standard Capability Structures Register Maps.... 4269
49.8.2.2 PCI Express Extended Capability Register Maps.... 4271
49.8.3 Accessing Configuration Registers (Configuration).... 4272
49.9 PCIe Registers: Port Logic.... 4274
49.9.1 Overview (Port Logic).... 4274
49.9.2 Non-Standard Addressing of the iATU Port Logic Registers.... 4274
49.9.3 Accessing Configuration Registers (Port Logic Registers).... 4275
49.10 PCIe CTRL EP Mode Memory Map/Register Definition.... 4276

49.10.1 Device ID and Vendor ID Register (PCIE_EP_DeviceID)..... 4278
49.10.2 Command and Status Register (PCIE_EP_Command)..... 4278
49.10.3 BIST Register (PCIE_EP_BIST)..... 4281
49.10.4 Base Address 0 (PCIE_EP_BAR0)..... 4282
49.10.5 BAR 0 Mask Register (PCIE_EP_MASK0)..... 4284
49.10.6 BAR 1 Mask Register (PCIE_EP_MASK1)..... 4287
49.10.7 BAR 2 Mask Register (PCIE_EP_MASK2)..... 4288
49.10.8 BAR 3 Mask Register (PCIE_EP_MASK3)..... 4289
49.10.9 CardBus CIS Pointer Register (PCIE_EP_CISP)..... 4290
49.10.10 Subsystem ID and Subsystem Vendor ID Register (PCIE_EP_SSID)..... 4290
49.10.11 Expansion ROM Base Address Register (PCIE_EP_EROMBAR)..... 4291
49.10.12 Expansion ROM BAR Mask Register (PCIE_EP_EROMMASK)..... 4292
49.10.13 Capability Pointer Register (PCIE_EP_CAPPR)..... 4293
49.10.14 Interrupt Line and Pin Register (PCIE_EP_ILR)..... 4293
49.10.15 AER Capability Header (PCIE_EP_AER)..... 4294
49.10.16 Uncorrectable Error Status Register (PCIE_EP_UESR)..... 4295
49.10.17 Uncorrectable Error Mask Register (PCIE_EP_UEMR)..... 4297
49.10.18 Uncorrectable Error Severity Register (PCIE_EP_UESevR)..... 4299
49.10.19 Correctable Error Status Register (PCIE_EP_CESR)..... 4301
49.10.20 Correctable Error Mask Register (PCIE_EP_CEMR)..... 4302
49.10.21 Advanced Capabilities and Control Register (PCIE_EP_ACCR)..... 4304
49.10.22 Header Log Register (PCIE_EP_HLR)..... 4305
49.10.23 VC Extended Capability Header (PCIE_EP_VCECHR)..... 4305
49.10.24 Port VC Capability Register 1 (PCIE_EP_PVCCR1)..... 4306
49.10.25 Port VC Capability Register 2 (PCIE_EP_PVCCR2)..... 4307
49.10.26 Port VC Control and Status Register (PCIE_EP_PVCCSR)..... 4308
49.10.27 VC Resource Capability Register n (PCIE_EP_VCRCR)..... 4310
49.10.28 VC Resource Control Register n (PCIE_EP_VCRConR)..... 4312
49.10.29 VC Resource Status Register n (PCIE_EP_VCRSR)..... 4314

49.11 PCIe CTRL RC Mode Memory Map/Register Definition....4315
49.11.1 Device ID and Vendor ID Register (PCIE_RC_DeviceID)....4318
49.11.2 Command and Status Register (PCIE_RC_Command)....4318
49.11.3 Revision ID and Class Code Register (PCIE_RC_RevID)....4321
49.11.4 BIST Register (PCIE_RC_BIST)....4321
49.11.5 Base Address 0 (PCIE_RC_BAR0)....4322
49.11.6 Base Address 1 (PCIE_RC_BAR1)....4325
49.11.7 Bus Number Registers (PCIE_RC_BNR)....4325
49.11.8 I/O Base Limit Secondary Status Register (PCIE_RC_IOBLSSR)....4327
49.11.9 Memory Base and Memory Limit Register (PCIE_RC_MEM_BLR)....4329
49.11.10 Prefetchable Memory Base and Limit Register (PCIE_RC_PREF_MEM_BLR)....4330
49.11.11 Prefetchable Base Upper 32 Bits Register (PCIE_RC_PREF_BASE_U32)....4330
49.11.12 Prefetchable Limit Upper 32 Bits Register (PCIE_RC_PREF_LIM_U32)....4331
49.11.13 I/O Base and Limit Upper 16 Bits Register (PCIE_RC_IO_BASE_LIM_U16)....4331
49.11.14 Capability Pointer Register (PCIE_RC_CAPPR)....4332
49.11.15 Expansion ROM Base Address Register (PCIE_RC_EROMBAR)....4332
49.11.16 Expansion ROM BAR Mask Register (PCIE_RC_EROMMASK)....4333
49.11.17 Power Management Capability Register (PCIE_RC_PMCR)....4334
49.11.18 Power Management Control and Status Register (PCIE_RC_PMCSR)....4337
49.11.19 PCI Express Capability ID Register (PCIE_RC_CIDR)....4338
49.11.20 Device Capabilities Register (PCIE_RC_DCR)....4341
49.11.21 Device Control Register (PCIE_RC_DConR)....4343
49.11.22 Link Capabilities Register (PCIE_RC_LCR)....4345
49.11.23 Link Control and Status Register (PCIE_RC_LCSR)....4348
49.11.24 Slot Capabilities Register (PCIE_RC_SCR)....4350
49.11.25 Slot Control and Status Register (PCIE_RC_SCSR)....4353
49.11.26 Root Control and Capabilities Register (PCIE_RC_RCCR)....4356
49.11.27 Root Status Register (PCIE_RC_RSR)....4358
49.11.28 Device Capabilities 2 Register (PCIE_RC_DCR2)....4359

49.11.29 Device Control and Status 2 Register (PCIE_RC_DCSR2)..... 4361
49.11.30 Link Capabilities 2 Register (PCIE_RC_LCR2)..... 4363
49.11.31 Link Control and Status 2 Register (PCIE_RC_LCSR2)..... 4365
49.11.32 AER Capability Header (PCIE_RC_AER)..... 4367
49.11.33 Uncorrectable Error Status Register (PCIE_RC_UESR)..... 4368
49.11.34 Uncorrectable Error Mask Register (PCIE_RC_UEMR)..... 4370
49.11.35 Uncorrectable Error Severity Register (PCIE_RC_UESevR)..... 4372
49.11.36 Correctable Error Status Register (PCIE_RC_CESR)..... 4374
49.11.37 Correctable Error Mask Register (PCIE_RC_CEMR)..... 4375
49.11.38 Advanced Capabilities and Control Register (PCIE_RC_ACCR)..... 4377
49.11.39 Header Log Register (PCIE_RC_HLR)..... 4378
49.11.40 Root Error Command Register (PCIE_RC_RECR)..... 4379
49.11.41 Root Error Status Register (PCIE_RC_RESR)..... 4380
49.11.42 Error Source Identification Register (PCIE_RC_ESIR)..... 4381
49.11.43 VC Extended Capability Header (PCIE_RC_VCECHR)..... 4382
49.11.44 Port VC Capability Register 1 (PCIE_RC_PVCCR1)..... 4383
49.11.45 Port VC Capability Register 2 (PCIE_RC_PVCCR2)..... 4384
49.11.46 Port VC Control and Status Register (PCIE_RC_PVCCSR)..... 4385
49.11.47 VC Resource Capability Register n (PCIE_RC_VCRCR)..... 4387
49.11.48 VC Resource Control Register n (PCIE_RC_VCRConR)..... 4389
49.11.49 VC Resource Status Register n (PCIE_RC_VCRSR)..... 4391
49.12 PCIe CTRL Port Logic Memory Map/Register Definition..... 4392
49.12.1 Ack Latency Timer and Replay Timer Register (PCIE_PL_ALTRTR)..... 4398
49.12.2 Vendor Specific DLLP Register (PCIE_PL_VSDR)..... 4398
49.12.3 Port Force Link Register (PCIE_PL_PFLR)..... 4399
49.12.4 Ack Frequency and L0-L1 ASPM Control Register (PCIE_PL_AFLACR)..... 4400
49.12.5 Port Link Control Register (PCIE_PL_PLCR)..... 4402
49.12.6 Lane Skew Register (PCIE_PL_LSR)..... 4404
49.12.7 Symbol Number Register (PCIE_PL_SNR)..... 4405

49.12.8 Symbol Timer Register and Filter Mask Register 1 (PCIE_PL_STRFM1)..... 4406
49.12.9 Filter Mask Register 2 (PCIE_PL_STRFM2).....4410
49.12.10 AMBA Multiple Outbound Decomposed NP Sub-Requests Control Register (PCIE_PL_AMODNPSR)..... 4411
49.12.11 Debug Register 0 (PCIE_PL_DEBUG0).....4412
49.12.12 Debug Register 1 (PCIE_PL_DEBUG1).....4412
49.12.13 Transmit Posted FC Credit Status Register (PCIE_PL_TPFCSR)..... 4413
49.12.14 Transmit Non-Posted FC Credit Status Register (PCIE_PL_TNFCSR)..... 4414
49.12.15 Transmit Completion FC Credit Status Register (PCIE_PL_TCFCSR)..... 4415
49.12.16 Queue Status Register (PCIE_PL_QSR)..... 4416
49.12.17 VC Transmit Arbitration Register 1 (PCIE_PL_VCTAR1).....4418
49.12.18 VC Transmit Arbitration Register 2 (PCIE_PL_VCTAR2).....4419
49.12.19 VC0 Posted Receive Queue Control (PCIE_PL_VC0PRQC).....4420
49.12.20 VC0 Non-Posted Receive Queue Control (PCIE_PL_VC0NRQC).....4422
49.12.21 VC0 Completion Receive Queue Control (PCIE_PL_VC0CRQC)..... 4423
49.12.22 VCn Posted Receive Queue Control (PCIE_PL_VC*n*PRQC).....4424
49.12.23 VCn Non-Posted Receive Queue Control (PCIE_PL_VC*n*NRQC).....4426
49.12.24 VCn Completion Receive Queue Control (PCIE_PL_VC*n*CRQC)..... 4427
49.12.25 VC0 Posted Buffer Depth (PCIE_PL_VC0PBD).....4428
49.12.26 VC0 Non-Posted Buffer Depth (PCIE_PL_VC0NPBD).....4429
49.12.27 VC0 Completion Buffer Depth (PCIE_PL_VC0CBD)..... 4430
49.12.28 VCn Posted Buffer Depth (PCIE_PL_VC*n*PBD).....4431
49.12.29 VCn Non-Posted Buffer Depth (PCIE_PL_VC*n*NPBD).....4432
49.12.30 VCn Completion Buffer Depth (PCIE_PL_VC*n*CBD)..... 4433
49.12.31 Gen2 Control Register (PCIE_PL_G2CR)..... 4433
49.12.32 PHY Status (PCIE_PL_PHY_STATUS).....4435
49.12.33 PHY Control (PCIE_PL_PHY_CTRL)..... 4435
49.12.34 Master Response Composer Control Register 0 (PCIE_PL_MRCCR0).....4436
49.12.35 Master Response Composer Control Register 1 (PCIE_PL_MRCCR1).....4437

49.12.36 MSI Controller Address (PCIE_PL_MSICA)..... 4438
49.12.37 MSI Controller Upper Address (PCIE_PL_MSICUA)..... 4438
49.12.38 MSI Controller Interrupt n Enable (PCIE_PL_MSICI*n*_ENB)..... 4439
49.12.39 MSI Controller Interrupt n Mask (PCIE_PL_MSICI*n*_MASK)..... 4439
49.12.40 MSI Controller Interrupt n Status (PCIE_PL_MSICI*n*_STATUS)..... 4440
49.12.41 MSI Controller General Purpose IO Register (PCIE_PL_MSICGPIO)..... 4440
49.12.42 iATU Viewport Register (PCIE_PL_iATUVR)..... 4441
49.12.43 iATU Region Control 1 Register (PCIE_PL_iATURC1)..... 4442
49.12.44 iATU Region Control 2 Register (PCIE_PL_iATURC2)..... 4444
49.12.45 iATU Region Lower Base Address Register (PCIE_PL_iATURLBA)..... 4447
49.12.46 iATU Region Upper Base Address Register (PCIE_PL_iATURUBA)..... 4448
49.12.47 iATU Region Limit Address Register (PCIE_PL_iATURLA)..... 4449
49.12.48 iATU Region Lower Target Address Register (PCIE_PL_iATURLTA)..... 4449
49.12.49 iATU Region Upper Target Address Register (PCIE_PL_iATURUTA)..... 4450

Chapter 50
PCI Express PHY (PCIe_PHY)

50.1 Overview..... 4451
50.2 Applications..... 4451
50.3 PCIe2 PHY Features..... 4451
50.3.1 Standards Compliance..... 4451
50.3.2 PHY Features..... 4452
50.4 External Signals..... 4452
50.5 Functional Description..... 4452
50.5.1 Clocks and Resets..... 4452
50.5.1.1 Reference Clock Enables..... 4453
50.5.1.2 Reference Clock Frequency Selection..... 4453
50.5.1.3 Spread Spectrum Clocking..... 4453
50.5.2 Termination Resistance Tuning..... 4453
50.5.3 Control Register Access..... 4454

50.6 System Operation....4455
50.6.1 Powering Up and Powering Down....4455
50.6.1.1 Power Up Requirements....4455
50.6.1.2 Power-On Reset....4456
50.6.1.3 Power Supply Sequencing when the PCIe 2.0 PHY is Not Used....4457
50.6.1.4 Power Down Requirements....4457
50.7 Control Memory Map/Register Definition....4457
50.7.1 Register ID Low 16 bits (PCIE_PHY_IDCODE_LO)....4461
50.7.2 Register ID High 16 bits (PCIE_PHY_IDCODE_HI)....4461
50.7.3 Debug Register (PCIE_PHY_DEBUG)....4462
50.7.4 Debug Register (PCIE_PHY_RTUNE_DEBUG)....4462
50.7.5 PCIE_PHY_RTUNE_STAT....4463
50.7.6 PCIE_PHY_SS_PHASE....4463
50.7.7 PCIE_PHY_SS_FREQ....4464
50.7.8 PCIE_PHY_ATEOVRD....4464
50.7.9 PCIE_PHY_MPLL_OVRD_IN_LO....4465
50.7.10 PCIE_PHY_MPLL_OVRD_IN_HI....4466
50.7.11 PCIE_PHY_SSC_OVRD_IN....4467
50.7.12 PCIE_PHY_BS_OVRD_IN....4468
50.7.13 PCIE_PHY_LEVEL_OVRD_IN....4469
50.7.14 PCIE_PHY_SUP_OVRD_OUT....4469
50.7.15 PCIE_PHY_MPLL_ASIC_IN....4470
50.7.16 PCIE_PHY_BS_ASIC_IN....4471
50.7.17 PCIE_PHY_LEVEL_ASIC_IN....4472
50.7.18 PCIE_PHY_SSC_ASIC_IN....4473
50.7.19 PCIE_PHY_SUP_ASIC_OUT....4473
50.7.20 PCIE_PHY_ATEOVRD_STATUS....4474
50.7.21 PCIE_PHY_SCOPE_ENABLES....4475
50.7.22 PCIE_PHY_SCOPE_SAMPLES....4476

50.7.23 PCIE_PHY_SCOPE_COUNT....4476
50.7.24 PCIE_PHY_SCOPE_CTL....4477
50.7.25 PCIE_PHY_SCOPE_MASK*n*....4477
50.7.26 PCIE_PHY_MPLL_LOOP_CTL....4478
50.7.27 PCIE_PHY_MPLL_ATB_MEAS2....4478
50.7.28 PCIE_PHY_MPLL_OVR....4479
50.7.29 PCIE_PHY_RTUNE_RTUNE_CTRL....4480
50.7.30 PCIE_PHY_TX_OVRD_IN_LO....4481
50.7.31 PCIE_PHY_TX_OVRD_IN_HI....4483
50.7.32 PCIE_PHY_TX_OVRD_DRV_LO....4484
50.7.33 PCIE_PHY_TX_OVRD_OUT....4484
50.7.34 PCIE_PHY_RX_OVRD_IN_LO....4485
50.7.35 PCIE_PHY_RX_OVRD_IN_HI....4486
50.7.36 PCIE_PHY_RX_OVRD_OUT....4487
50.7.37 PCIE_PHY_TX_ASIC_IN....4488
50.7.38 PCIE_PHY_TX_ASIC_DRV_LO....4489
50.7.39 PCIE_PHY_TX_ASIC_DRV_HI....4490
50.7.40 PCIE_PHY_TX_ASIC_OUT....4490
50.7.41 PCIE_PHY_RX_ASIC_IN....4491
50.7.42 PCIE_PHY_RX_ASIC_OUT....4492
50.7.43 PCIE_PHY_TX_VMD_FSM_TX_VCM_0....4493
50.7.44 PCIE_PHY_TX_VMD_FSM_TX_VCM_1....4493
50.7.45 PCIE_PHY_TX_VMD_FSM_TX_VCM_DEBUG_IN....4494
50.7.46 PCIE_PHY_TX_VMD_FSM_TX_VCM_DEBUG_OUT....4495
50.7.47 PCIE_PHY_TX_LBERT_CTL....4495
50.7.48 PCIE_PHY_RX_LBERT_CTL....4496
50.7.49 PCIE_PHY_RX_LBERT_ERR....4497
50.7.50 PCIE_PHY_RX_SCOPE_CTL....4497
50.7.51 PCIE_PHY_RX_SCOPE_PHASE....4498

50.7.52 PCIE_PHY_RX_DPLL_FREQ ... 4498
50.7.53 PCIE_PHY_RX_CDR_CTL ... 4499
50.7.54 PCIE_PHY_RX_CDR_CDR_FSM_DEBUG ... 4500
50.7.55 PCIE_PHY_RX_CDR_LOCK_VEC_OVRD ... 4501
50.7.56 PCIE_PHY_RX_CDR_LOCK_VEC ... 4502
50.7.57 PCIE_PHY_RX_CDR_ADAP_FSM ... 4502
50.7.58 PCIE_PHY_RX_ATB0 ... 4503
50.7.59 PCIE_PHY_RX_ATB1 ... 4504
50.7.60 PCIE_PHY_RX_ENPWR0 ... 4504
50.7.61 PCIE_PHY_RX_PMIX_PHASE ... 4505
50.7.62 PCIE_PHY_RX_ENPWR1 ... 4506
50.7.63 PCIE_PHY_RX_ENPWR2 ... 4507
50.7.64 PCIE_PHY_RX_SCOPE ... 4508
50.7.65 PCIE_PHY_TX_TXDRV_CNTRL ... 4509
50.7.66 PCIE_PHY_TX_POWER_CTL ... 4510
50.7.67 PCIE_PHY_TX_ALT_BLOCK ... 4511
50.7.68 PCIE_PHY_TX_ALT_AND_LOOPBACK ... 4512
50.7.69 PCIE_PHY_TX_TX_ATB_REG ... 4513

Chapter 51
Power Management Unit (PMU)

51.1 Overview ... 4515
51.2 Digital LDO Regulators ... 4517
51.3 Analog LDO Regulators ... 4518
51.3.1 LDO 1P1 ... 4518
51.3.2 LDO 2P5 ... 4519
51.3.3 Low Power Operation ... 4519
51.4 USB LDO Regulator ... 4520
51.5 SNVS Regulator ... 4520
51.6 Power Modes ... 4520

51.6.1 Reverse Well Biasing....4520
51.7 PMU Memory Map/Register Definition....4521
51.7.1 Regulator 1P1 Register (PMU_REG_1P1*n*)....4523
51.7.2 Regulator 3P0 Register (PMU_REG_3P0*n*)....4526
51.7.3 Regulator 2P5 Register (PMU_REG_2P5*n*)....4528
51.7.4 Digital Regulator Core Register (PMU_REG_CORE*n*)....4530
51.7.5 Miscellaneous Register 0 (PMU_MISC0*n*)....4533
51.7.6 Miscellaneous Register 1 (PMU_MISC1*n*)....4536
51.7.7 Miscellaneous Control Register (PMU_MISC2*n*)....4538

Chapter 52
Pulse Width Modulation (PWM)

52.1 Overview....4543
52.2 External Signals....4544
52.3 Clocks....4545
52.4 Functional Description....4546
52.4.1 Operation....4547
52.4.1.1 FIFO....4547
52.4.1.2 Rollover and Compare Event....4548
52.4.1.3 Low Power Mode Behavior....4548
52.4.1.4 Debug Mode Behavior....4548
52.5 Enable Sequence for the PWM....4548
52.6 Disable Sequence for the PWM....4549
52.7 PWM Memory Map/Register Definition....4549
52.7.1 PWM Control Register (PWM*x*_PWMCR)....4551
52.7.2 PWM Status Register (PWM*x*_PWMSR)....4553
52.7.3 PWM Interrupt Register (PWM*x*_PWMIR)....4554
52.7.4 PWM Sample Register (PWM*x*_PWMSAR)....4555
52.7.5 PWM Period Register (PWM*x*_PWMPR)....4556
52.7.6 PWM Counter Register (PWM*x*_PWMCNR)....4557

Chapter 53
Pixel Pipeline (PXP)

53.1 Overview....4559

53.2 Clocks....4560

53.3 Top-level architecture....4560

53.3.1 Processing Details....4562

53.3.2 Scaling Operation....4563

53.3.3 Decimation Image Scaling....4564

53.3.4 Bilinear Image Scaling Filter....4566

53.3.5 YUV 4:2:2 Image Scaling....4568

53.3.6 YUV 4:2:0 Image Scaling....4569

53.3.7 RGB/YUV444 Image Scaling....4571

53.3.8 Color Space Conversion (CSC)....4571

53.3.9 CSC1 Operation....4572

53.3.10 YUV versus YCbCr Support....4573

53.3.11 CSC2 operation....4573

53.3.12 Alpha Blending/Color Key....4574

53.3.13 Alpha Blend....4574

53.3.14 Color Key....4575

53.3.15 LUT....4575

53.3.16 Lookup Modes....4575

53.3.17 DIRECT_Y8....4576

53.3.18 DIRECT_RGB444....4576

53.3.19 DIRECT_RGB454....4576

53.3.20 CACHE_RGB565....4577

53.3.21 Output Modes....4578

53.3.22 Y8....4578

53.3.23 RGBW4444CFA....4579

53.3.23.1 CFA Correction....4579

53.3.24 RGB888 4580
53.3.25 Rotation 4580
53.3.26 Output Buffer 4583
53.3.27 Address calculator 4583
53.3.28 Block size selection 4583
53.3.29 Interlaced Video Support 4583
53.3.30 Theory of Operation 4584
53.3.31 Pixel Handling 4584
53.3.32 Output Buffer Composition 4585
53.3.33 PS Image Processing 4586
53.3.34 Letterboxing 4587
53.3.35 Clipping source images 4587
53.3.36 Color Key Processing 4589
53.3.37 In Place Processing (PS buffer is destination buffer) 4591
53.3.38 Alpha Surface (AS) Processing 4591
53.3.39 Alpha Handling 4591
53.3.40 Color Key Processing (AS_CTRL) 4591
53.4 Output Image Processing 4592
53.4.1 Output Image Size 4592
53.4.2 Output Format 4592
53.4.3 Rotation/Flip operations 4592
53.5 Queuing PXP transactions 4593
53.6 Error Handling 4593
53.6.1 Known PXP Limitations/Issues 4594
53.7 PXP Memory Map/Register Definition 4594
53.7.1 Control Register 0 (PXP_CTRL*n*) 4597
53.7.2 Status Register (PXP_STAT*n*) 4600
53.7.3 Output Buffer Control Register (PXP_OUT_CTRL*n*) 4601
53.7.4 Output Frame Buffer Pointer (PXP_OUT_BUF) 4603

53.7.5 Output Frame Buffer Pointer #2 (PXP_OUT_BUF2)..... 4604
53.7.6 Output Buffer Pitch (PXP_OUT_PITCH)..... 4605
53.7.7 Output Surface Lower Right Coordinate (PXP_OUT_LRC)..... 4605
53.7.8 Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC)..... 4606
53.7.9 Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC)..... 4607
53.7.10 Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC)..... 4608
53.7.11 Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC)..... 4609
53.7.12 Processed Surface (PS) Control Register (PXP_PS_CTRL*n*)..... 4610
53.7.13 PS Input Buffer Address (PXP_PS_BUF)..... 4612
53.7.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF)..... 4612
53.7.15 PS V/Cr Input Buffer Address (PXP_PS_VBUF)..... 4613
53.7.16 Processed Surface Pitch (PXP_PS_PITCH)..... 4614
53.7.17 PS Background Color (PXP_PS_BACKGROUND)..... 4614
53.7.18 PS Scale Factor Register (PXP_PS_SCALE)..... 4615
53.7.19 PS Scale Offset Register (PXP_PS_OFFSET)..... 4616
53.7.20 PS Color Key Low (PXP_PS_CLRKEYLOW)..... 4617
53.7.21 PS Color Key High (PXP_PS_CLRKEYHIGH)..... 4618
53.7.22 Alpha Surface Control (PXP_AS_CTRL)..... 4619
53.7.23 Alpha Surface Buffer Pointer (PXP_AS_BUF)..... 4621
53.7.24 Alpha Surface Pitch (PXP_AS_PITCH)..... 4622
53.7.25 Overlay Color Key Low (PXP_AS_CLRKEYLOW)..... 4622
53.7.26 Overlay Color Key High (PXP_AS_CLRKEYHIGH)..... 4623
53.7.27 Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0)..... 4624
53.7.28 Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1)..... 4625
53.7.29 Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2)..... 4626
53.7.30 Color Space Conversion Control Register (PXP_CSC2_CTRL)..... 4627
53.7.31 Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0)..... 4628
53.7.32 Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1)..... 4629
53.7.33 Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2)..... 4629

53.7.34 Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3)..... 4630
53.7.35 Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4)..... 4631
53.7.36 Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5)..... 4631
53.7.37 Lookup Table Control Register (PXP_LUT_CTRL).....4632
53.7.38 Lookup Table Control Register (PXP_LUT_ADDR)..... 4634
53.7.39 Lookup Table Data Register (PXP_LUT_DATA)..... 4635
53.7.40 Lookup Table External Memory Address Register (PXP_LUT_EXTMEM)..... 4636
53.7.41 Color Filter Array Register (PXP_CFA)..... 4637
53.7.42 Histogram Control Register (PXP_HIST_CTRL)..... 4637
53.7.43 2-level Histogram Parameter Register (PXP_HIST2_PARAM)..... 4638
53.7.44 4-level Histogram Parameter Register (PXP_HIST4_PARAM)..... 4639
53.7.45 8-level Histogram Parameter 0 Register (PXP_HIST8_PARAM0)..... 4640
53.7.46 8-level Histogram Parameter 1 Register (PXP_HIST8_PARAM1)..... 4641
53.7.47 16-level Histogram Parameter 0 Register (PXP_HIST16_PARAM0)..... 4642
53.7.48 16-level Histogram Parameter 1 Register (PXP_HIST16_PARAM1)..... 4643
53.7.49 16-level Histogram Parameter 2 Register (PXP_HIST16_PARAM2)..... 4644
53.7.50 16-level Histogram Parameter 3 Register (PXP_HIST16_PARAM3)..... 4645
53.7.51 PXP Power Control Register (PXP_POWER).....4646
53.7.52 Next Frame Pointer (PXP_NEXT)..... 4646

Chapter 54
ROM Controller with Patch (ROMC)

54.1 Overview.....4649
54.1.1 Features..... 4650
54.1.2 Modes of Operation..... 4650
54.1.2.1 Low Power Mode.....4651
54.2 Clocks..... 4651
54.3 Memory Map..... 4651
54.3.1 ROM Memory Map in detail..... 4651
54.4 Functional Description.....4652

54.4.1 ROM Controller (ROMC) Functional Description....4652
54.4.1.1 Functionality overview....4652
54.4.2 ROMC Functional Description....4652
54.4.2.1 ROMC Disabling....4653
54.4.2.2 ROMC Event Priority....4653
54.4.2.3 Data Fixing....4653
54.4.2.4 Opcode Patching....4654
54.4.2.4.1 Typical Software Response to Opcode Patch....4655
54.4.2.5 External Boot Feature....4656
54.4.2.6 Alternate Masters and ROMC....4657
54.5 ROMCP Memory Map/Register Definition....4657
54.5.1 ROMC Data Registers (ROMC_ROMPATCH*n*D)....4658
54.5.2 ROMC Control Register (ROMC_ROMPATCHCNTL)....4659
54.5.3 ROMC Enable Register High (ROMC_ROMPATCHENH)....4660
54.5.4 ROMC Enable Register Low (ROMC_ROMPATCHENL)....4660
54.5.5 ROMC Address Registers (ROMC_ROMPATCH*n*A)....4661
54.5.6 ROMC Status Register (ROMC_ROMPATCHSR)....4662

Chapter 55
Smart Direct Memory Access Controller (SDMA)

55.1 Overview....4665
55.1.1 Block Diagram....4665
55.1.2 Features....4667
55.2 External Signals....4669
55.3 Clocks....4669
55.4 Functional Description....4669
55.4.1 SDMA Core....4670
55.4.1.1 SDMA Core Structure....4671
55.4.1.2 Program Control Unit (PCU)....4674
55.4.1.2.1 Instruction Types....4674

55.4.1.2.2 PCU States ... 4675
55.4.1.3 SDMA Core Memory ... 4678
55.4.2 Scheduler ... 4678
55.4.2.1 Primary Functions ... 4678
55.4.2.2 Channels and DMA Requests ... 4679
55.4.2.2.1 Channels ... 4679
55.4.2.2.2 DMA Requests ... 4679
55.4.2.2.3 Mapping from DMA Requests to Channels and Priorities ... 4679
55.4.2.3 Scheduler Functional Description ... 4679
55.4.2.3.1 Scheduler Overview ... 4679
55.4.2.3.2 DMA Requests Scanning ... 4680
55.4.2.3.3 Mapping DMA Requests to Pending Channels ... 4681
55.4.2.3.4 Channel Overflow ... 4684
55.4.2.3.5 Runnable Channels Evaluation ... 4684
55.4.2.3.6 Next Channel Decision Tree ... 4686
55.4.2.3.7 Scheduler State Diagram ... 4688
55.4.2.3.8 Scheduler Pipeline Timing Diagram ... 4690
55.4.2.3.9 Channel-DMA Request Mapping ... 4690
55.4.2.3.10 Examples: How to Start a Channel ... 4690
55.4.2.4 Context Switching ... 4691
55.4.2.4.1 Context Switch Modes ... 4692
55.4.2.4.2 Context Switch Procedure ... 4692
55.4.2.4.3 Context Map in Memory ... 4694
55.4.3 Functional Units ... 4694
55.4.3.1 Burst DMA Unit ... 4694
55.4.3.1.1 Burst DMA Structure ... 4695
55.4.3.1.2 Burst DMA Registers ... 4696
55.4.3.1.3 Burst DMA Data Transfers ... 4697
55.4.3.1.3.1 Data Retrieval from the Arm platform Memory ... 4697

55.4.3.1.3.2 Storing Data Into the Arm platform Memory....4697
55.4.3.1.3.3 Transferring Data Between Two Arm platform Memory Locations-Burst DMA Unit....4698
55.4.3.2 Peripheral DMA Unit....4698
55.4.3.2.1 Peripheral DMA Structure....4699
55.4.3.2.2 Peripheral DMA Registers....4700
55.4.3.2.3 Peripheral DMA Data Transfers....4701
55.4.3.2.3.1 Data Retrieval from the Arm platform Memory or Peripheral....4701
55.4.3.2.3.2 Storing Data into the Arm platform Memory or Peripheral....4701
55.4.3.2.3.3 Transferring Data Between Two Arm platform Memory Locations-Peripheral DMA Unit....4702
55.4.4 SDMA Security Support....4702
55.4.4.1 Locked Mode....4702
55.4.5 OnCE and PCU Debug States....4703
55.4.6 SDMA Clocks and Low Power Modes....4705
55.4.6.1 Clock Gating and Low Power Modes....4706
55.4.6.1.1 Coarse Clock Gating....4706
55.4.6.1.2 Refined Clock Gating....4707
55.4.6.1.3 Low Power Modes and User Control....4707
55.4.6.1.3.1 SLEEP Mode....4708
55.4.6.1.3.2 RUN Mode....4708
55.4.6.1.3.3 DEBUG Mode....4709
55.4.6.1.4 Stop Mode Response....4709
55.4.6.2 Reset....4709
55.4.7 Software Interface....4709
55.4.8 Initialization Information....4710
55.4.8.1 Hardware Reset....4710
55.4.8.2 Channel Script Execution....4711
55.4.8.3 Initialization and Script Execution Setup Sequence....4711

55.4.9 SDMA Programming Model....4712
55.4.9.1 State and Registers Per Channel....4712
55.4.9.2 General Purpose Registers....4713
55.4.9.3 Functional Unit State....4713
55.4.9.3.1 Program Counter Register (PC)....4713
55.4.9.3.2 Flags....4713
55.4.9.3.3 Return Program Counter (RPC)....4714
55.4.9.3.4 Loop Mode Start Program Counter (SPC)....4714
55.4.9.3.5 Loop Mode End Program Counter (EPC)....4714
55.4.9.4 Context Switching-Programming....4715
55.4.9.5 Address Space....4716
55.4.9.5.1 Instruction Memory Map....4717
55.4.9.5.2 Data Memory Map....4717
55.4.10 SDMA Initialization....4719
55.4.10.1 Hardware Reset-SDMA....4719
55.4.10.2 Standard Boot Sequence....4719
55.4.10.3 User-Defined Boot Sequence....4720
55.4.10.4 Script Loading and Context Initialization....4720
55.4.11 Instruction Description....4721
55.4.11.1 Scheduling Instructions....4721
55.4.11.2 Conditional Branch Instructions....4721
55.4.11.3 Unconditional Jump Instructions....4722
55.4.11.4 Subroutine Return Instructions....4722
55.4.11.5 Loop Instruction....4722
55.4.11.6 Miscellaneous Instructions....4723
55.4.11.7 Logic Instructions....4723
55.4.11.8 Arithmetic Instructions....4723
55.4.11.9 Compare Instructions....4724
55.4.11.10 Test Instructions....4724

55.4.11.11 Byte Permutation Instructions....4724
55.4.11.12 Bit Shift Instructions....4725
55.4.11.13 Bit Manipulation Instructions....4725
55.4.11.14 SDMA Memory Access Instructions....4725
55.4.11.15 Functional Unit Instructions....4726
55.4.11.16 Illegal Instructions....4726
55.4.11.17 Debug Instructions....4726
55.4.12 Functional Units Programming Model....4727
55.4.12.1 Burst DMA Unit Programming....4728
55.4.12.1.1 Memory Source Address Register (MSA)....4728
55.4.12.1.2 Memory Destination Address Register (MDA)....4729
55.4.12.1.3 Memory Data Buffer Register (MD)....4729
55.4.12.1.4 State Register (MS)....4730
55.4.12.1.5 Burst DMA Write (stf)....4731
55.4.12.1.6 Burst DMA Read (ldf)....4734
55.4.12.1.7 Prefetch/Flush and Auto-Flush Management-Burst DMA Unit....4735
55.4.12.1.8 Data Alignment and Endianness-Burst DMA Unit....4737
55.4.12.1.8.1 Burst DMA in Read Mode....4737
55.4.12.1.8.2 Burst DMA in Write Mode....4738
55.4.12.1.8.3 Endianness-Burst DMA Unit....4739
55.4.12.1.9 Burst DMA Unit Copy Mode....4740
55.4.12.1.10 Burst DMA Unit Error Management....4741
55.4.12.1.11 Conditional Yielding-Burst DMA Unit....4742
55.4.12.2 Peripheral DMA Unit Programming....4743
55.4.12.2.1 Peripheral Source Address Register (PSA)....4744
55.4.12.2.2 Peripheral Destination Address Register (PDA)....4745
55.4.12.2.3 Peripheral Data Register (PD)....4745
55.4.12.2.4 Peripheral State Register (PS)....4746
55.4.12.2.5 Peripheral DMA Write (stf)-Write Mode....4747

55.4.12.2.6 Peripheral DMA Read (ldf)-Read Mode....4750
55.4.12.2.7 Peripheral DMA Unit Copy Mode....4751
55.4.12.2.8 Error Management....4752
55.4.12.2.8.1 Immediate Errors....4752
55.4.12.2.8.2 Data Transfer Errors....4752
55.4.12.2.8.3 Read Error (First Phase)....4753
55.4.12.2.8.4 Write Error and Read Error (Second Phase)....4753
55.4.12.2.8.5 Copy Mode Errors....4754
55.4.12.2.8.6 Error Check Example....4754
55.4.12.2.9 Peripheral DMA Unit Prefetch/Flush Management....4755
55.4.12.3 OnCE and Real-Time Debug....4755
55.4.12.3.1 Memory and Register Access....4756
55.4.12.3.2 Hardware Breakpoints....4756
55.4.12.3.3 Watchpoints....4756
55.4.12.3.4 Software Breakpoints....4756
55.4.12.3.5 Core Control....4756
55.4.13 The OnCE Controller....4756
55.4.13.1 OnCE Commands....4757
55.4.13.2 Sending Commands to the OnCE Controller....4758
55.4.13.2.1 Using the JTAG Interface....4758
55.4.13.2.2 Using the Arm platform....4758
55.4.13.2.3 Conflicts Between the JTAG and the Arm platform Accesses....4760
55.4.13.3 Executing a Command from the OnCE....4760
55.4.13.3.1 Nature of the Commands....4760
55.4.13.3.2 Execution Request....4761
55.4.13.3.3 Command Execution....4761
55.4.13.4 Registers Descriptions....4763
55.4.13.4.1 Event Cell Counter Register (ECOUNT)....4763
55.4.13.4.2 Event Cell Address Registers (EAA or EAB)....4763

55.4.13.4.3 Event Cell Address Mask Register (EAM)....4764
55.4.13.4.4 Event Cell Data Register (ED)....4764
55.4.13.4.5 Event Cell Data Mask Register (EDM)....4764
55.4.13.4.6 Real Time Buffer Register (RTB)....4764
55.4.13.4.7 Event Control Register (ECTL)....4765
55.4.13.4.8 Trace Buffer (TB)....4765
55.4.13.4.9 OnCE Status Register (OSTAT)....4765
55.4.13.5 JTAG Interface Requirements....4766
55.4.13.5.1 TCK Speed Limitation....4766
55.4.13.5.2 Synchronization Implementation....4766
55.4.13.5.3 JTAG Controller Start-Up Recommended Procedure....4768
55.4.14 Using the OnCE....4768
55.4.14.1 Activating Clocks in Debug Mode....4768
55.4.14.2 Getting the Current Status....4768
55.4.14.3 Methods of Entering Debug Mode....4769
55.4.14.3.1 External Debug Request During Reset....4769
55.4.14.3.2 Debug Request During Normal Activity....4769
55.4.14.3.3 Software Breakpoint Instruction....4769
55.4.14.3.4 Event Detection Unit Matching Condition....4769
55.4.14.4 Executing Instructions in Debug Mode....4770
55.4.14.5 Command Sequences Examples....4770
55.4.14.5.1 Getting the SDMA Status....4770
55.4.14.5.2 Saving the Context....4771
55.4.14.5.3 Restoring the Context....4772
55.4.14.5.4 Accessing the Memory....4773
55.4.14.5.5 Resuming Program Execution....4774
55.4.14.5.6 Single Stepping in RAM....4774
55.4.14.5.7 Single Stepping in ROM....4775
55.4.14.6 OnCE Event Detection Unit....4775

55.4.14.7 Clock Gating and Reset....4776
55.4.14.7.1 Clocks....4776
55.4.14.7.2 Resets....4777
55.4.14.8 Real Time Features....4777
55.4.14.8.1 Trace Buffer....4777
55.4.14.8.2 Real Time Buffer....4779
55.4.14.8.3 Emulation Pin....4779
55.4.14.8.4 Real-Time Debug Outputs....4779
55.5 Instruction Set....4783
55.5.1 Instruction Encoding....4783
55.5.2 SDMA Instruction Set....4785
55.5.2.1 ADD (Addition)....4786
55.5.2.2 ADDI (Add with Immediate Value)....4787
55.5.2.3 AND (Logical AND)....4788
55.5.2.4 ANDI (Logical AND with Immediate Value)....4789
55.5.2.5 ANDN (Logical AND NOT)....4790
55.5.2.6 ANDNI (Logical AND with Negated Immediate Value)....4791
55.5.2.7 ASR1 (Arithmetic Shift Right by 1 Bit)....4792
55.5.2.8 BCLRI1 (Bit Clear Immediate)....4793
55.5.2.9 BDF (Conditional Branch if Destination Fault)....4794
55.5.2.10 BF (Conditional Branch if False)....4795
55.5.2.11 BSETI (Bit Set Immediate)....4796
55.5.2.12 BSF (Conditional Branch if Source Fault)....4797
55.5.2.13 BT (Conditional Branch if True)....4798
55.5.2.14 BTSTI (Bit Test immediate)....4799
55.5.2.15 CLRF (Clear Arm platform flags)....4800
55.5.2.16 CMPEQ (Compare for Equal)....4801
55.5.2.17 CMPEQI (Compare with Immediate for Equal)....4802
55.5.2.18 CMPHS (Compare for Higher or Same)....4803

55.5.2.19 CMPLT (Compare for Less Than)....4804
55.5.2.20 cpShReg (Update Context of PCU Registers and Flag)....4805
55.5.2.21 DONE (DONE, Yield)....4805
55.5.2.22 ILLEGAL (ILLEGAL Instruction)....4807
55.5.2.23 JMP (Unconditional Jump Immediate)....4808
55.5.2.24 JMPR (Unconditional Jump)....4808
55.5.2.25 JSR (Unconditional Jump to Subroutine Immediate)....4809
55.5.2.26 JSRR (Unconditional Jump to Subroutine)....4810
55.5.2.27 LD (Load Register)....4811
55.5.2.28 LDF (Load Register from Functional Unit)....4812
55.5.2.29 LDI (Load Register with Immediate Value)....4814
55.5.2.30 LDRPC (Load from RPC to Register)....4815
55.5.2.31 LOOP (Hardware Loop)....4816
55.5.2.32 LSL1 (Logical Shift Left by 1 Bit)....4818
55.5.2.33 LSR1 (Logical Shift Right by 1 Bit)....4819
55.5.2.34 MOV (Logical Move)....4820
55.5.2.35 NOTIFY (Notify to Arm platform)....4821
55.5.2.36 OR (Logical OR)....4822
55.5.2.37 ORI (Logical OR with Immediate Value)....4823
55.5.2.38 RET (Return from Subroutine)....4824
55.5.2.39 REVB (Reverse Byte Order)....4825
55.5.2.40 Reverse Low Order Bytes(REVBLO)....4825
55.5.2.41 ROR1 (Rotate Right by 1 Bit)....4826
55.5.2.42 RORB (Rotate Right by 1 Byte)....4827
55.5.2.43 SOFTBKPT (Software Breakpoint)....4828
55.5.2.44 ST (Store Register)....4828
55.5.2.45 STF (Store Register in Functional Unit)....4830
55.5.2.46 SUB (Subtract)....4833
55.5.2.47 SUBI (Subtract with Immediate)....4834

55.5.2.48 TST (Test with Zero)..... 4835
55.5.2.49 TSTI (Test Immediate).....4836
55.5.2.50 XOR (Logical Exclusive OR)..... 4837
55.5.2.51 XORI (Exclusive OR with Immediate).....4838
55.5.2.52 YIELD, YIELDGE (DONE, Yield).....4839
55.6 Software Restrictions.....4839
55.6.1 Unsupported Burst DMA Access Sequence..... 4839
55.7 Application Notes..... 4840
55.7.1 Data Structures for Boot Code and Channel Scripts.....4840
55.7.1.1 Buffer Descriptor Format.....4841
55.7.1.2 Buffer Descriptor Commands for Bootload scripts..... 4844
55.7.1.3 Example of Buffer Descriptors for Channel 0..... 4845
55.7.1.4 Channel Context.....4848
55.7.2 Typical Data Transfer Supported by SDMA DMA Units..... 4848
55.7.2.1 External Memory to External Memory.....4849
55.7.2.2 Peripheral to Peripheral Transfer..... 4850
55.7.2.2.1 Source and Destination Target Have the Same Data Path Width.....4850
55.7.2.2.2 Source and Destination Target Have a Different Data Path Width..... 4851
55.7.2.3 Transfer Between Peripheral and External Memory.....4852
55.7.2.3.1 Peripheral to External Memory Transfer..... 4852
55.7.2.3.2 External Memory to Peripheral Transfer..... 4854
55.7.2.4 Transfer Between External Memory and Internal Memory.....4855
55.7.2.4.1 Internal Memory to Internal Memory.....4855
55.7.2.4.2 Transfer Between Peripheral and Internal Memory.....4855
55.8 Arm Platform Memory Map and Control Register Definitions.....4855
55.8.1 Arm platform Channel 0 Pointer (SDMAARM_MC0PTR).....4861
55.8.2 Channel Interrupts (SDMAARM_INTR)..... 4861
55.8.3 Channel Stop/Channel Status (SDMAARM_STOP_STAT).....4861
55.8.4 Channel Start (SDMAARM_HSTART).....4862

55.8.5 Channel Event Override (SDMAARM_EVTOVR)..... 4862
55.8.6 Channel BP Override (SDMAARM_DSPOVR)..... 4863
55.8.7 Channel Arm platform Override (SDMAARM_HOSTOVR)..... 4863
55.8.8 Channel Event Pending (SDMAARM_EVTPEND)..... 4863
55.8.9 Reset Register (SDMAARM_RESET)..... 4864
55.8.10 DMA Request Error Register (SDMAARM_EVTERR)..... 4865
55.8.11 Channel Arm platform Interrupt Mask (SDMAARM_INTRMASK)..... 4865
55.8.12 Schedule Status (SDMAARM_PSW)..... 4866
55.8.13 DMA Request Error Register (SDMAARM_EVTERRDBG)..... 4866
55.8.14 Configuration Register (SDMAARM_CONFIG)..... 4867
55.8.15 SDMA LOCK (SDMAARM_SDMA_LOCK)..... 4868
55.8.16 OnCE Enable (SDMAARM_ONCE_ENB)..... 4869
55.8.17 OnCE Data Register (SDMAARM_ONCE_DATA)..... 4870
55.8.18 OnCE Instruction Register (SDMAARM_ONCE_INSTR)..... 4870
55.8.19 OnCE Status Register (SDMAARM_ONCE_STAT)..... 4870
55.8.20 OnCE Command Register (SDMAARM_ONCE_CMD)..... 4872
55.8.21 Illegal Instruction Trap Address (SDMAARM_ILLINSTADDR)..... 4873
55.8.22 Channel 0 Boot Address (SDMAARM_CHN0ADDR)..... 4873
55.8.23 DMA Requests (SDMAARM_EVT_MIRROR)..... 4874
55.8.24 DMA Requests 2 (SDMAARM_EVT_MIRROR2)..... 4874
55.8.25 Cross-Trigger Events Configuration Register 1 (SDMAARM_XTRIG_CONF1)..... 4875
55.8.26 Cross-Trigger Events Configuration Register 2 (SDMAARM_XTRIG_CONF2)..... 4877
55.8.27 Channel Priority Registers (SDMAARM_SDMA_CHNPRI*n*)..... 4878
55.8.28 Channel Enable RAM (SDMAARM_CHNENBL*n*)..... 4878
55.9 BP Memory Map and Control Register Definitions..... 4879
55.9.1 Channel 0 Pointer (SDMABP_DC0PTR)..... 4879
55.9.2 Channel Interrupts (SDMABP_INTR)..... 4880
55.9.3 Channel Stop/Channel Status (SDMABP_STOP_STAT)..... 4880
55.9.4 Channel Start (SDMABP_DSTART)..... 4881

55.9.5 DMA Request Error Register (SDMABP_EVTERR)....4881
55.9.6 Channel DSP Interrupt Mask (SDMABP_INTRMASK)....4882
55.9.7 DMA Request Error Register (SDMABP_EVTERRDBG)....4882
55.10 SDMA Internal (Core) Memory Map and Internal Register Definitions....4882
55.10.1 Arm platform Channel 0 Pointer (SDMACORE_MC0PTR)....4884
55.10.2 Current Channel Pointer (SDMACORE_CCPTR)....4884
55.10.3 Current Channel Register (SDMACORE_CCR)....4884
55.10.4 Highest Pending Channel Register (SDMACORE_NCR)....4885
55.10.5 External DMA Requests Mirror (SDMACORE_EVENTS)....4886
55.10.6 Current Channel Priority (SDMACORE_CCPRI)....4887
55.10.7 Next Channel Priority (SDMACORE_NCPRI)....4887
55.10.8 OnCE Event Cell Counter (SDMACORE_ECOUNT)....4888
55.10.9 OnCE Event Cell Control Register (SDMACORE_ECTL)....4888
55.10.10 OnCE Event Address Register A (SDMACORE_EAA)....4890
55.10.11 OnCE Event Cell Address Register B (SDMACORE_EAB)....4890
55.10.12 OnCE Event Cell Address Mask (SDMACORE_EAM)....4890
55.10.13 OnCE Event Cell Data Register (SDMACORE_ED)....4891
55.10.14 OnCE Event Cell Data Mask (SDMACORE_EDM)....4891
55.10.15 OnCE Real-Time Buffer (SDMACORE_RTB)....4892
55.10.16 OnCE Trace Buffer (SDMACORE_TB)....4892
55.10.17 OnCE Status (SDMACORE_OSTAT)....4893
55.10.18 Channel 0 Boot Address (SDMACORE_MCHN0ADDR)....4895
55.10.19 ENDIAN Status Register (SDMACORE_ENDIANNESS)....4896
55.10.20 Lock Status Register (SDMACORE_SDMA_LOCK)....4897
55.10.21 External DMA Requests Mirror #2 (SDMACORE_EVENTS2)....4898
55.11 SDMA Peripheral Registers....4898

Chapter 56
System JTAG Controller (SJC)

56.1 Overview....4899

56.1.1 Features ... 4900
56.1.2 Modes of Operation ... 4901
56.2 External Signals ... 4903
56.2.1 External Signal Overview ... 4904
56.2.2 TAP Controller ... 4905
56.2.3 Accessing ExtraDebug Registers ... 4907
56.3 TAP Selection Block (TSB) ... 4909
56.3.1 Select Mode Using Software ... 4910
56.4 Boundary Scan Register (BSR) ... 4911
56.5 SJC Instruction Register (SJIR) ... 4911
56.5.1 SJC ID_CODE Instruction (SJC IDCODE) ... 4912
56.5.2 SAMPLE/PRELOAD Instruction ... 4913
56.5.3 EXTEST Instruction ... 4914
56.5.4 HIGHZ Instruction ... 4914
56.5.5 BYPASS Instruction ... 4914
56.5.6 ENABLE_ExtraDebug Instruction ... 4915
56.5.7 ENTER_DEBUG instruction ... 4915
56.5.8 TAP Select Instruction ... 4916
56.5.9 EXTEST_PULSE instruction ... 4916
56.5.10 EXTEST_TRAIN instruction ... 4916
56.6 Security ... 4917
56.6.1 JTAG Security Modes ... 4917
56.6.1.1 Mode 1: No Debug - Maximum Security ... 4917
56.6.1.2 Mode 2: Secure JTAG - High Security ... 4918
56.6.1.2.1 Challenge/Response Mechanism in System JTAG Mode ... 4918
56.6.1.3 Mode 3: JTAG Enabled - Low Security ... 4919
56.6.2 Software Enabled JTAG ... 4919
56.6.3 Kill Trace ... 4920
56.6.4 SJC Disable Fuse ... 4921

56.7 Functional Description....4922
56.7.1 Static Core Debug....4922
56.7.2 Reset Mechanism....4922
56.8 Initialization/Application Information....4923
56.9 SJC Memory Map/Register Definition....4924
56.9.1 General Purpose Unsecured Status Register 1 (SJC_GPUSR1)....4925
56.9.2 General Purpose Unsecured Status Register 2 (SJC_GPUSR2)....4927
56.9.3 General Purpose Unsecured Status Register 3 (SJC_GPUSR3)....4927
56.9.4 General Purpose Secured Status Register (SJC_GPSSR)....4928
56.9.5 Debug Control Register (SJC_DCR)....4929
56.9.6 Security Status Register (SJC_SSR)....4931
56.9.7 General Purpose Clocks Control Register (SJC_GPCCR)....4934

Chapter 57
Secure Non-Volatile Storage (SNVS)

57.1 SNVS overview....4935
57.1.1 SNVS features....4935
57.1.2 Modes of operation....4936
57.2 External signals....4936
57.3 Clocks....4936
57.4 SNVS structure....4937
57.4.1 SNVS_HP (high-power domain)....4938
57.4.2 Non-secure real-time counter....4938
57.4.2.1 Calibrating the time counter....4938
57.4.2.2 Time counter alarm....4939
57.4.2.3 Periodic interrupt....4939
57.5 SNVS_LP (low-power domain)....4940
57.5.1 Behavior during system power down....4940
57.5.2 Monotonic Counter (MC)....4940
57.6 SNVS reset and system powerup....4941

57.6.1 PMIC interface....4942
57.7 SNVS interrupts and alarms....4943
57.8 Programming guidelines....4944
57.8.1 RTC control bits setting....4944
57.8.2 RTC value read....4945
57.8.3 General initialization guidelines....4945
57.9 SNVS Memory Map/Register Definition....4946
57.9.1 SNVS_HP Lock register (SNVS_HPLR)....4948
57.9.2 SNVS_HP Command register (SNVS_HPCOMR)....4950
57.9.3 SNVS_HP Control register (SNVS_HPCR)....4952
57.9.4 SNVS_HP Status register (SNVS_HPSR)....4955
57.9.5 SNVS_HP Real-Time Counter MSB Register (SNVS_HPRTCMR)....4957
57.9.6 SNVS_HP Real-Time Counter LSB Register (SNVS_HPRTCLR)....4958
57.9.7 SNVS_HP Time Alarm MSB Register (SNVS_HPTAMR)....4958
57.9.8 SNVS_HP Time Alarm LSB Register (SNVS_HPTALR)....4959
57.9.9 SNVS_LP Lock Register (SNVS_LPLR)....4960
57.9.10 SNVS_LP Control Register (SNVS_LPCR)....4962
57.9.11 SNVS_LP Status Register (SNVS_LPSR)....4964
57.9.12 SNVS_LP Secure Monotonic Counter MSB Register (SNVS_LPSMCMR)....4966
57.9.13 SNVS_LP Secure Monotonic Counter LSB Register (SNVS_LPSMCLR)....4967
57.9.14 SNVS_LP General-Purpose Register (SNVS_LPGPR)....4967
57.9.15 SNVS_HP Version ID Register 1 (SNVS_HPVIDR1)....4968
57.9.16 SNVS_HP Version ID Register 2 (SNVS_HPVIDR2)....4968

Chapter 58
Shared Peripheral Bus Arbiter (SPBA)

58.1 Overview....4971
58.1.1 Features....4972
58.1.2 Modes of operation....4973
58.2 Clocks....4973

58.3 Functional description....4974
58.3.1 Masters arbitration....4974
58.4 Resource ownership control....4977
58.4.1 Access control....4977
58.4.1.1 Peripheral access....4977
58.4.1.2 Peripheral Right Register access....4978
58.4.2 Owner election....4979
58.4.3 Ending ownership....4979
58.4.3.1 Software Controlled Ownership Ending....4979
58.4.4 The Un-owned State....4980
58.5 SPBA Memory Map/Register Definition....4980
58.5.1 Peripheral Rights Register (SPBA_PRR*n*)....4982

Chapter 59
Sony/Philips Digital Interface (SPDIF)

59.1 Overview....4985
59.2 External Signals....4987
59.3 Clocks....4987
59.4 Functional Description....4987
59.4.1 SPDIF Receiver....4989
59.4.1.1 Audio Data Reception....4989
59.4.1.1.1 Application Note....4991
59.4.1.2 Channel Status Reception....4992
59.4.1.2.1 Channel Status Interrupt....4992
59.4.1.3 User Bit Reception....4992
59.4.1.4 Validity Flag Reception....4994
59.4.1.5 SPDIF Receiver Interrupt Exception Definition....4995
59.4.1.6 Standards Compliance....4995
59.4.1.7 SPDIF PLOCK Detection and Rxclk Output....4996
59.4.1.8 Measuring Frequency of SPDIF_RxClk....4996

59.4.2 SPDIF Transmitter ... 4997
59.4.2.1 Audio Data Transmission ... 4997
59.4.2.2 Channel Status Transmission ... 4998
59.4.2.3 Validity Flag Transmission ... 4998
59.5 SPDIF Memory Map/Register Definition ... 4998
59.5.1 SPDIF Configuration Register (SPDIF_SCR) ... 5000
59.5.2 CDText Control Register (SPDIF_SRCD) ... 5002
59.5.3 PhaseConfig Register (SPDIF_SRPC) ... 5003
59.5.4 InterruptEn Register (SPDIF_SIE) ... 5004
59.5.5 InterruptStat Register (SPDIF_SIS) ... 5006
59.5.6 InterruptClear Register (SPDIF_SIC) ... 5008
59.5.7 SPDIFRxLeft Register (SPDIF_SRL) ... 5009
59.5.8 SPDIFRxRight Register (SPDIF_SRR) ... 5010
59.5.9 SPDIFRxCChannel_h Register (SPDIF_SRCSH) ... 5010
59.5.10 SPDIFRxCChannel_l Register (SPDIF_SRCSL) ... 5011
59.5.11 UchannelRx Register (SPDIF_SRU) ... 5011
59.5.12 QchannelRx Register (SPDIF_SRQ) ... 5012
59.5.13 SPDIFTxLeft Register (SPDIF_STL) ... 5012
59.5.14 SPDIFTxRight Register (SPDIF_STR) ... 5013
59.5.15 SPDIFTxCChannelCons_h Register (SPDIF_STCSCH) ... 5013
59.5.16 SPDIFTxCChannelCons_l Register (SPDIF_STCSCL) ... 5014
59.5.17 FreqMeas Register (SPDIF_SRFM) ... 5014
59.5.18 SPDIFTxClk Register (SPDIF_STC) ... 5015

Chapter 60
System Reset Controller (SRC)

60.1 SRC Overview ... 5017
60.1.1 Features ... 5017
60.2 External Signals ... 5017
60.3 Clocks ... 5019

60.4 Top-level resets, power-up sequence and external supply integration..... 5019
60.4.1 Reset and Power-up Flow..... 5019
60.4.2 Finite-State Machine (FSM)..... 5022
60.4.3 Power mode transitions..... 5023
60.5 Power-On Reset and power sequencing..... 5024
60.5.1 External POR using SRC_POR_B..... 5024
60.5.2 Internal POR..... 5024
60.6 Functional Description..... 5025
60.6.1 Reset Control..... 5025
60.6.1.1 Reset inputs and outputs..... 5025
60.6.1.2 Reset Handling..... 5027
60.6.1.2.1 Reset Qualification..... 5027
60.6.1.2.2 Reset Sequence and De-Assertion..... 5028
60.6.1.2.3 POR (SRC_POR_B)..... 5028
60.6.1.2.4 COLD RESET..... 5029
60.6.1.2.5 WARM RESET..... 5030
60.6.2 Parallel Reset Requests..... 5031
60.6.3 Boot Mode Control..... 5032
60.6.3.1 BOOT_MODE Pin Latching..... 5032
60.7 SRC Memory Map/Register Definition..... 5033
60.7.1 SRC Control Register (SRC_SCR)..... 5035
60.7.2 SRC Boot Mode Register 1 (SRC_SBMR1)..... 5038
60.7.3 SRC Reset Status Register (SRC_SRSR)..... 5039
60.7.4 SRC Interrupt Status Register (SRC_SISR)..... 5041
60.7.5 SRC Interrupt Mask Register (SRC_SIMR)..... 5043
60.7.6 SRC Boot Mode Register 2 (SRC_SBMR2)..... 5045
60.7.7 SRC General Purpose Register 1 (SRC_GPR1)..... 5046
60.7.8 SRC General Purpose Register 2 (SRC_GPR2)..... 5047
60.7.9 SRC General Purpose Register 3 (SRC_GPR3)..... 5047

60.7.10 SRC General Purpose Register 4 (SRC_GPR4)..... 5048
60.7.11 SRC General Purpose Register 5 (SRC_GPR5)..... 5048
60.7.12 SRC General Purpose Register 6 (SRC_GPR6)..... 5049
60.7.13 SRC General Purpose Register 7 (SRC_GPR7)..... 5049
60.7.14 SRC General Purpose Register 8 (SRC_GPR8)..... 5050
60.7.15 SRC General Purpose Register 9 (SRC_GPR9)..... 5050
60.7.16 SRC General Purpose Register 10 (SRC_GPR10)..... 5051

Chapter 61
Synchronous Serial Interface (SSI)

61.1 Overview.....5053
61.1.1 Features..... 5054
61.1.2 Modes of Operation..... 5055
61.2 External Signal Description..... 5055
61.2.1 Signals Overview..... 5055
61.3 Clocks..... 5059
61.4 SSI Transmit FIFO 0 & 1 Registers.....5059
61.5 SSI Transmit Shift Register (TXSR)..... 5060
61.6 SSI Receive FIFO 0 and 1 Registers.....5062
61.7 SSI Receive Shift Register (RXSR).....5063
61.8 Functional Description.....5065
61.8.1 Operating Modes.....5065
61.8.1.1 Normal Mode..... 5067
61.8.1.1.1 Normal Mode Transmit.....5067
61.8.1.1.2 Normal Mode Receive..... 5068
61.8.1.2 Network Mode..... 5070
61.8.1.2.1 Network Mode Transmit.....5071
61.8.1.2.2 Network Mode Receive..... 5072
61.8.1.3 Gated Clock Mode..... 5074
61.8.1.4 I2S Mode.....5077

61.8.1.5 AC97 Mode....5079
61.8.1.5.1 AC97 Fixed Mode (SSI.SACNT[1]=0)....5081
61.8.1.5.2 AC97 Variable Mode (SSI.SACNT[1]=1)....5081
61.8.2 External Frame and Clock Operation....5082
61.8.2.1 Data Alignment Formats Supported....5082
61.8.3 SSI Architecture....5083
61.8.4 SSI Clocking....5084
61.8.4.1 SSI Clock and Frame Sync Generation....5085
61.8.4.2 DIV2, PSR and PM Bit Description....5086
61.8.5 Receive Interrupt Enable Bit Description....5088
61.8.6 Transmit Interrupt Enable Bit Description....5089
61.8.7 Internal Frame and Clock Shutdown....5090
61.8.8 Peripheral Bus Interface....5092
61.8.8.1 Transfer Lengths Supported....5092
61.8.8.2 Transfer Bus Errors....5092
61.8.8.3 Clock Rate....5093
61.8.9 Reset....5093
61.9 SSI Memory Map/Register Definition....5093
61.9.1 SSI Transmit Data Register n (SSI*x*_STX*n*)....5096
61.9.2 SSI Receive Data Register n (SSI*x*_SRX*n*)....5096
61.9.3 SSI Control Register (SSI*x*_SCR)....5097
61.9.4 SSI Interrupt Status Register (SSI*x*_SISR)....5099
61.9.5 SSI Interrupt Enable Register (SSI*x*_SIER)....5105
61.9.6 SSI Transmit Configuration Register (SSI*x*_STCR)....5109
61.9.7 SSI Receive Configuration Register (SSI*x*_SRCR)....5111
61.9.8 SSI Transmit Clock Control Register (SSI*x*_STCCR)....5113
61.9.9 SSI Receive Clock Control Register (SSI*x*_SRCCR)....5115
61.9.10 SSI FIFO Control/Status Register (SSI*x*_SFCSR)....5116
61.9.11 SSI AC97 Control Register (SSI*x*_SACNT)....5120

61.9.12 SSI AC97 Command Address Register (SSI*x*_SACADD)....5121
61.9.13 SSI AC97 Command Data Register (SSI*x*_SACDAT)....5121
61.9.14 SSI AC97 Tag Register (SSI*x*_SATAG)....5122
61.9.15 SSI Transmit Time Slot Mask Register (SSI*x*_STMSK)....5122
61.9.16 SSI Receive Time Slot Mask Register (SSI*x*_SRMSK)....5123
61.9.17 SSI AC97 Channel Status Register (SSI*x*_SACCST)....5123
61.9.18 SSI AC97 Channel Enable Register (SSI*x*_SACCEN)....5124
61.9.19 SSI AC97 Channel Disable Register (SSI*x*_SACCDIS)....5124

Chapter 62
Temperature Monitor (TEMPMON)

62.1 Overview....5125
62.2 Software Usage Guidelines....5126
62.3 TEMPMON Memory Map/Register Definition....5127
62.3.1 Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0*n*)....5128
62.3.2 Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1*n*)....5130

Chapter 63
TrustZone Address Space Controller (TZASC)

63.1 Overview....5131
63.2 Clocks....5132
63.3 i.MX 6Solo/6DualLite Specific Configuration....5132
63.4 Address Mapping in various memory mapping modes....5133

Chapter 64
Universal Asynchronous Receiver/Transmitter (UART)

64.1 Overview....5135
64.1.1 Features....5136
64.1.2 Modes of operation....5137
64.2 External Signals....5137
64.2.1 Detailed Signal Descriptions....5142
64.2.1.1 Interrupt Signals....5142
64.2.1.1.1 interrupt_uart - UART Interrupt....5142

64.2.1.2 DMA Request Signals....5142
64.2.1.2.1 dma_req_rx - Receiver DMA Request....5142
64.2.1.2.2 dma_req_tx - Transmitter DMA Request....5142
64.2.1.3 Special Signals....5142
64.2.1.3.1 stop_req - Stop Mode....5142
64.2.1.3.2 doze_req - Doze Mode....5143
64.2.1.3.3 debug_req - Debug Mode....5143
64.3 Clocks....5143
64.4 Functional Description....5143
64.4.1 Interrupts and DMA Requests....5143
64.4.2 Clocks....5145
64.4.2.1 Clock requirements....5145
64.4.2.2 Maximum Baud Rate....5145
64.4.2.3 Clocking in Low-Power Modes....5146
64.4.3 General UART Definitions....5146
64.4.3.1 RTS_B - UART Request To Send....5147
64.4.3.2 RTS Edge Triggered Interrupt....5148
64.4.3.3 DTR_B - Data Terminal Ready....5148
64.4.3.4 DSR_B - Data Set Ready....5149
64.4.3.5 DTR_B/DSR_B Edge Triggered Interrupt....5149
64.4.3.6 DCD_B - Data Carrier Detect....5150
64.4.3.7 RI_B - Ring Indicator....5150
64.4.3.8 CTS_B - Clear To Send....5150
64.4.3.9 Programmable CTS_B Deassertion....5150
64.4.3.10 TX_DATA - UART Transmit....5151
64.4.3.11 RX_DATA - UART Receive....5151
64.4.4 Transmitter....5153
64.4.4.1 Transmitter FIFO Empty Interrupt Suppression....5153
64.4.4.2 Transmitting a Break Condition....5155

64.4.5 Receiver ... 5155
64.4.5.1 Idle Line Detect ... 5156
64.4.5.2 Aging Character Detect ... 5157
64.4.5.3 Receiver Wake ... 5158
64.4.5.4 Receiving a BREAK Condition ... 5159
64.4.5.5 Vote Logic ... 5159
64.4.5.6 Baud Rate Automatic Detection Logic ... 5161
64.4.5.6.1 Baud Rate Automatic Detection Protocol ... 5162
64.4.5.6.2 New Baud Rate Determination ... 5162
64.4.5.6.2.1 New Autobaud Counter Stopped bit and Interrupt ... 5163
64.4.6 Escape Sequence Detection ... 5163
64.5 Binary Rate Multiplier (BRM) ... 5165
64.6 Infrared Interface ... 5167
64.6.1 Generalities-Infrared ... 5167
64.6.2 Inverted Transmission and Reception bits (INVT & INVR) ... 5168
64.6.3 InfraRed Special Case (IRSC) Bit ... 5168
64.6.4 IrDA interrupt ... 5169
64.6.5 Conclusion about IrDA ... 5170
64.6.6 Programming IrDA Interface ... 5171
64.6.6.1 High Speed ... 5171
64.6.6.2 Low Speed ... 5171
64.7 9-bit RS-485 Mode ... 5172
64.7.1 Generalities ... 5172
64.7.2 Transmit 9-bit RS-485 frames ... 5173
64.7.3 Receive 9-bit RS-485 frames ... 5173
64.7.3.1 RS-485 Slave Address Normal Detect Mode ... 5173
64.7.3.2 RS-485 Slave Address Automatic Detect Mode ... 5174
64.8 Low Power Modes ... 5174
64.8.1 UART Operation in System Doze Mode ... 5175

64.8.2 UART Operation in System Stop Mode 5175
64.8.3 Power Saving Method in UART 5176
64.9 UART Operation in System Debug State 5176
64.10 Reset 5177
64.10.1 Hardware reset 5177
64.10.2 Software reset 5177
64.11 Transfer Error 5177
64.12 Functional Timing 5178
64.12.1 IrDA Mode 5178
64.13 Initialization 5178
64.13.1 Programming the UART in RS-232 mode 5178
64.13.2 Programming the UART in 9-bit RS-485 mode 5180
64.14 References 5181
64.15 UART Memory Map/Register Definition 5182
64.15.1 UART Receiver Register (UART*x*_URXD) 5187
64.15.2 UART Transmitter Register (UART*x*_UTXD) 5189
64.15.3 UART Control Register 1 (UART*x*_UCR1) 5190
64.15.4 UART Control Register 2 (UART*x*_UCR2) 5192
64.15.5 UART Control Register 3 (UART*x*_UCR3) 5195
64.15.6 UART Control Register 4 (UART*x*_UCR4) 5197
64.15.7 UART FIFO Control Register (UART*x*_UFCR) 5199
64.15.8 UART Status Register 1 (UART*x*_USR1) 5201
64.15.9 UART Status Register 2 (UART*x*_USR2) 5204
64.15.10 UART Escape Character Register (UART*x*_UESC) 5206
64.15.11 UART Escape Timer Register (UART*x*_UTIM) 5207
64.15.12 UART BRM Incremental Register (UART*x*_UBIR) 5207
64.15.13 UART BRM Modulator Register (UART*x*_UBMR) 5208
64.15.14 UART Baud Rate Count Register (UART*x*_UBRC) 5208
64.15.15 UART One Millisecond Register (UART*x*_ONEMS) 5209

64.15.16 UART Test Register (UART*x*_UTS)....5210
64.15.17 UART RS-485 Mode Control Register (UART*x*_UMCR)....5211

Chapter 65
Universal Serial Bus Controller (USB)

65.1 Overview....5213
65.1.1 Features....5214
65.1.2 Modes of Operation....5216
65.1.2.1 Normal Mode....5216
65.1.2.2 Low-Power Mode....5217
65.2 External Signals....5217
65.3 Functional Description....5218
65.3.1 USB 2.0 Controller Core 0....5218
65.3.1.1 Host Mode....5218
65.3.1.2 Peripheral (Device) Mode....5218
65.3.1.3 Pins Used for OTG Controller....5218
65.3.2 USB 2.0 Controller Core 1....5219
65.3.2.1 Pins Used for Host Controller 1....5219
65.3.3 USB 2.0 Controller Core 2....5219
65.3.4 USB 2.0 Controller Core 3....5220
65.3.5 USB Power Control....5220
65.3.5.1 Entering Low Power Suspend Mode....5220
65.3.5.2 Wake-Up Events....5221
65.3.5.2.1 Host Mode Events....5221
65.3.6 Interrupts....5222
65.3.6.1 USB Core Interrupts....5222
65.3.6.2 USB Wake-Up Interrupts....5222
65.4 USB Operation Model....5222
65.4.1 Register Interface....5223
65.4.1.1 Configuration, Control and Status Register Set....5223

65.4.1.2 Identification Registers 5225
65.4.1.3 OTG Operations 5225
65.4.1.3.1 Register Bits 5225
65.4.2 Host Data Structures 5227
65.4.2.1 Periodic Frame List 5227
65.4.2.2 Asynchronous List Queue Head Pointer 5229
65.4.2.3 Isochronous (High-Speed) Transfer Descriptor (iTD) 5230
65.4.2.3.1 Next Link Pointer 5231
65.4.2.3.2 iTD Transaction Status and Control List 5232
65.4.2.3.3 iTD Buffer Page Pointer List (Plus) 5233
65.4.2.4 Split Transaction Isochronous Transfer Descriptor (siTD) 5235
65.4.2.4.1 Next Link Pointer 5235
65.4.2.4.2 siTD Endpoint Capabilities/Characteristics 5236
65.4.2.4.3 siTD Transfer State 5237
65.4.2.4.4 siTD Buffer Pointer List (plus) 5238
65.4.2.4.5 siTD Back Link Pointer 5239
65.4.2.5 Queue element transfer descriptor (qTD) 5239
65.4.2.5.1 Next qTD Pointer 5240
65.4.2.5.2 Alternate Next qTD Pointer 5241
65.4.2.5.3 qTD Token 5241
65.4.2.5.4 qTD Buffer Page Pointer List 5244
65.4.2.6 Queue Head 5245
65.4.2.6.1 Queue Head Horizontal Link Pointer 5245
65.4.2.6.2 Queue Head Endpoint Capabilities/Characteristics 5246
65.4.2.6.3 Transfer Overlay-Queue Head 5248
65.4.2.7 Periodic Frame Span Traversal Node (FSTN) 5249
65.4.2.7.1 FSTN Normal Path Pointer 5250
65.4.2.7.2 FSTN Back Path Link Pointer 5250
65.4.3 Host Operational Model 5251

65.4.3.1 Host Controller Initialization 5251
65.4.3.2 Port Routing and Control..... 5253
65.4.3.2.1 Port Routing Control through EHCI Configured (CF) Bit 5255
65.4.3.2.2 Port Routing Control through PortOwner and Disconnect Event 5256
65.4.3.2.3 Example Port Routing State Machine 5258
65.4.3.2.3.1 EHCI HC Owner 5258
65.4.3.2.3.2 Companion HC Owner 5259
65.4.3.2.4 Port Power 5259
65.4.3.2.5 Port Reporting Over-Current 5260
65.4.3.3 Suspend/Resume-Host Operational Model 5261
65.4.3.3.1 Port Suspend/Resume 5261
65.4.3.4 Schedule Traversal Rules.....5264
65.4.3.4.1 Example - Preserving Micro-Frame Integrity 5266
65.4.3.4.1.1 Transaction Fit - A Best-Fit Approximation Algorithm 5266
65.4.3.5 Periodic Schedule Frame Boundaries vs Bus Frame Boundaries 5268
65.4.3.6 Periodic Schedule 5271
65.4.3.7 Managing Isochronous Transfers Using iTDs 5273
65.4.3.7.1 Host Controller Operational Model for iTDs 5273
65.4.3.7.2 Software Operational Model for iTDs 5275
65.4.3.7.2.1 Periodic scheduling threshold.....5277
65.4.3.8 Asynchronous Schedule 5278
65.4.3.8.1 Adding Queue Heads to Asynchronous Schedule..... 5279
65.4.3.8.2 Removing Queue Heads from Asynchronous Schedule 5280
65.4.3.8.3 Empty Asynchronous Schedule Detection 5282
65.4.3.8.4 Restarting Asynchronous Schedule Before EOF 5283
65.4.3.8.4.1 Example Method for Restarting Asynchronous Schedule Traversal 5284
65.4.3.8.4.2 Async Sched Not Active 5285
65.4.3.8.4.3 Async Sched Active 5285

65.4.3.8.4.4 Async Sched Sleeping 5286
65.4.3.8.4.5 Example Derivation for AsyncSchedSleepTime..... 5286
65.4.3.8.5 Asynchronous schedule traversal: Start Event..... 5286
65.4.3.8.6 Reclamation Status Bit (USBSTS Register)..... 5287
65.4.3.9 Operational Model for Nak Counter..... 5287
65.4.3.9.1 Nak Count Reload Control 5289
65.4.3.9.1.1 Wait for List Head 5290
65.4.3.9.1.2 Do Reload 5290
65.4.3.9.1.3 Wait for Start Event 5290
65.4.3.10 Managing Control/Bulk/Interrupt Transfers through Queue Heads..... 5291
65.4.3.10.1 Fetch Queue Head 5293
65.4.3.10.2 Advance Queue 5293
65.4.3.10.3 Execute Transaction 5294
65.4.3.10.3.1 Interrupt Transfer Pre-condition Criteria 5295
65.4.3.10.3.2 Asynchronous Transfer Pre-operations and Pre-condition Criteria 5295
65.4.3.10.3.3 Transfer Type Independent Pre-operations..... 5295
65.4.3.10.3.4 Halting a Queue Head 5298
65.4.3.10.3.5 Asynchronous Schedule Park Mode 5299
65.4.3.10.4 Write Back qTD 5301
65.4.3.10.5 Follow Queue Head Horizontal Pointer 5301
65.4.3.10.6 Buffer Pointer List Use for Data Streaming with qTDs 5302
65.4.3.10.7 Adding Interrupt Queue Heads to the Periodic Schedule 5304
65.4.3.10.8 Managing Transfer Complete Interrupts from Queue Heads 5304
65.4.3.11 Ping Control..... 5305
65.4.3.12 Split Transactions..... 5306
65.4.3.12.1 Split Transactions for Asynchronous Transfers 5307
65.4.3.12.1.1 Asynchronous - Do Start Split..... 5308
65.4.3.12.1.2 Asynchronous - Do Complete Split 5308

65.4.3.12.2 Split Transaction Interrupt 5309
65.4.3.12.2.1 Split Transaction Scheduling Mechanisms for Interrupt 5310
65.4.3.12.2.2 Host Controller Operational Model for FSTNs.....5313
65.4.3.12.2.3 Software Operational Model for FSTNs..... 5316
65.4.3.12.2.4 Tracking Split Transaction Progress for Interrupt Transfers .5317
65.4.3.12.2.5 Split Transaction Execution State Machine for Interrupt.....5318
65.4.3.12.2.6 Rebalancing the periodic schedule 5324
65.4.3.12.3 Split Transaction Isochronous 5325
65.4.3.12.3.1 Split Transaction Scheduling Mechanisms for Isochronous . 5325
65.4.3.12.3.2 Tracking Split Transaction Progress for Isochronous Transfers.....5330
65.4.3.12.3.3 Split Transaction Execution State Machine for Isochronous 5332
65.4.3.12.3.4 Periodic Isochronous - Do Start Split 5333
65.4.3.12.3.5 Periodic Isochronous - Do Complete Split 5335
65.4.3.12.3.6 Complete-Split for Scheduling Boundary Cases 2a, 2b 5338
65.4.3.12.3.7 Split Transaction for Isochronous - Processing Examples..... 5340
65.4.3.13 Host Controller Pause..... 5342
65.4.3.14 Port Test Modes -Host Operational Model..... 5343
65.4.3.15 Interrupts-Host Operational Model..... 5343
65.4.3.15.1 Transfer/Transaction Based Interrupts 5345
65.4.3.15.1.1 Transaction Error 5345
65.4.3.15.1.2 Serial Bus Babble..... 5345
65.4.3.15.1.3 Data Buffer Error 5346
65.4.3.15.1.4 USB Interrupt (Interrupt on Completion (IOC)) 5347
65.4.3.15.1.5 Short Packet.....5347
65.4.3.15.2 Host Controller Event Interrupts 5347
65.4.3.15.2.1 Port Change Events 5348
65.4.3.15.2.2 Frame List Rollover 5348
65.4.3.15.2.3 Interrupt on Async Advance 5348

65.4.3.15.2.4 Host System Error 5348
65.4.4 EHCI Deviation.....5349
65.4.4.1 Embedded Transaction Translator Function.....5350
65.4.4.1.1 Capability Registers.....5350
65.4.4.1.2 Operational Registers.....5351
65.4.4.1.3 Discovery-EHCI Deviation.....5351
65.4.4.1.4 Data Structures.....5351
65.4.4.1.5 Operational Model.....5352
65.4.4.1.5.1 Micro- frame Pipeline.....5352
65.4.4.1.5.2 Split State Machines.....5353
65.4.4.1.5.3 Asynchronous Transaction Scheduling and Buffer Management.....5354
65.4.4.1.5.4 Periodic Transaction Scheduling and Buffer Management....5354
65.4.4.1.5.5 Multiple Transaction Translators.....5355
65.4.4.2 Device Operation.....5355
65.4.4.2.1 USB_USBMODE Register.....5355
65.4.4.2.2 Non-Zero Fields the Register File.....5355
65.4.4.2.3 SOF Interrupt.....5356
65.4.4.3 Embedded Design Interface.....5356
65.4.4.3.1 Frame Adjust Register.....5356
65.4.4.4 Miscellaneous variations from EHCI.....5356
65.4.4.4.1 Programmable Physical Interface Behaviour.....5356
65.4.4.4.2 Discovery.....5356
65.4.4.4.2.1 Port Reset.....5356
65.4.4.4.2.2 Port Speed Detection.....5357
65.4.4.4.3 Port Test Mode.....5357
65.4.5 Device Data Structures.....5357
65.4.5.1 Endpoint Queue Head (dQH).....5359
65.4.5.1.1 Endpoint Capabilities/Characteristics.....5360

65.4.5.1.2 Transfer Overlay-Endpoint Queue Head 5360
65.4.5.1.3 Current dTD Pointer 5361
65.4.5.1.4 Set-up Buffer 5361
65.4.5.2 Endpoint Transfer Descriptor (dTD) 5361
65.4.6 Device Operational Model 5363
65.4.6.1 Device Controller Initialization 5364
65.4.6.2 Port State and Control 5365
65.4.6.2.1 Bus Reset 5367
65.4.6.2.2 Suspend/Resume 5368
65.4.6.2.2.1 Suspend 5368
65.4.6.2.2.2 Resume 5369
65.4.6.3 Managing Endpoints 5369
65.4.6.3.1 Endpoint Initialization 5370
65.4.6.3.2 Stalling 5371
65.4.6.3.3 Data Toggle 5372
65.4.6.3.3.1 Data Toggle Reset 5372
65.4.6.3.3.2 Data Toggle Inhibit 5372
65.4.6.3.3.3 Priming Transmit Endpoints 5372
65.4.6.3.3.4 Priming Receive Endpoints 5373
65.4.6.4 Operational Model For Packet Transfers 5373
65.4.6.4.1 Interrupt/Bulk Endpoint Operational Model 5374
65.4.6.4.1.1 Interrupt/Bulk Endpoint Bus Response Matrix 5376
65.4.6.4.2 Control Endpoint Operation Model 5376
65.4.6.4.2.1 Setup Phase 5376
65.4.6.4.2.2 Data Phase 5377
65.4.6.4.2.3 Status Phase 5378
65.4.6.4.2.4 Control Endpoint Bus Response Matrix 5378
65.4.6.4.3 Isochronous Endpoint Operational Model 5379
65.4.6.4.3.1 Isochronous Pipe Synchronization 5381

65.4.6.4.3.2 Isochronous Endpoint Bus Response Matrix 5381
65.4.6.5 Managing Queue Heads 5381
65.4.6.5.1 Queue Head Initialization 5382
65.4.6.5.2 Operational Model For Setup Transfers 5383
65.4.6.6 Managing Transfers with Transfer Descriptors 5384
65.4.6.6.1 Software Link Pointers 5384
65.4.6.6.2 Building a Transfer Descriptor 5384
65.4.6.6.3 Executing A Transfer Descriptor 5385
65.4.6.6.4 Transfer Completion 5386
65.4.6.6.5 Flushing/De-priming an Endpoint 5386
65.4.6.6.6 Device Error Matrix 5387
65.4.6.7 Servicing Interrupts 5388
65.4.6.7.1 High-Frequency Interrupts 5388
65.4.6.7.2 Low-Frequency Interrupts 5388
65.4.6.7.3 Error Interrupts 5388
65.5 USB Non-Core Memory Map/Register Definition 5389
65.5.1 USB OTG Control Register (USBNC_USB_OTG_CTRL) 5391
65.5.2 USB Host1 Control Register (USBNC_USB_UH1_CTRL) 5394
65.5.3 USB Host2 Control Register (USBNC_USB_UH2_CTRL) 5397
65.5.4 USB Host3 Control Register (USBNC_USB_UH3_CTRL) 5399
65.5.5 USB Host2 HSIC Control Register (USBNC_USB_UH2_HSIC_CTRL) 5401
65.5.6 USB Host3 HSIC Control Register (USBNC_USB_UH3_HSIC_CTRL) 5403
65.5.7 OTG UTMI PHY Control 0 Register (USBNC_USB_OTG_PHY_CTRL_0) 5404
65.5.8 Host1 UTMI PHY Control 0 Register (USBNC_USB_UH1_PHY_CTRL_0) 5405
65.6 USB Core Memory Map/Register Definition 5406

65.6.7 General Purpose Timer #0 Load (USB_*n*GPTIMER0LD).....5416
65.6.8 General Purpose Timer #0 Controller (USB_*n*GPTIMER0CTRL).....5416
65.6.9 General Purpose Timer #1 Load (USB_*n*GPTIMER1LD).....5418
65.6.10 General Purpose Timer #1 Controller (USB_*n*GPTIMER1CTRL).....5418
65.6.11 System Bus Config (USB_*n*SBUSCFG)..... 5419
65.6.12 Capability Registers Length (USB_*n*CAPLENGTH).....5420
65.6.13 Host Controller Interface Version (USB_*n*HCIVERSION)..... 5421
65.6.14 Host Controller Structural Parameters (USB_*n*HCSPARAMS)..... 5421
65.6.15 Host Controller Capability Parameters (USB_*n*HCCPARAMS)..... 5423
65.6.16 Device Controller Interface Version (USB_*n*DCIVERSION)..... 5425
65.6.17 Device Controller Capability Parameters (USB_*n*DCCPARAMS)..... 5425
65.6.18 USB Command Register (USB_*n*USBCMD).....5427
65.6.19 USB Status Register (USB_*n*USBSTS).....5431
65.6.20 Interrupt Enable Register (USB_*n*USBINTR).....5435
65.6.21 USB Frame Index (USB_*n*FRINDEX).....5437
65.6.22 Frame List Base Address (USB_*n*PERIODICLISTBASE).....5438
65.6.23 Device Address (USB_*n*DEVICEADDR).....5438
65.6.24 Next Asynch. Address (USB_*n*ASYNCLISTADDR).....5439
65.6.25 Endpoint List Address (USB_*n*ENDPTLISTADDR).....5440
65.6.26 Programmable Burst Size (USB_*n*BURSTSIZE).....5440
65.6.27 TX FIFO Fill Tuning (USB_*n*TXFILLTUNING)..... 5441
65.6.28 Endpoint NAK (USB_*n*ENDPTNAK)..... 5443
65.6.29 Endpoint NAK Enable (USB_*n*ENDPTNAKEN).....5443
65.6.30 Configure Flag Register (USB_*n*CONFIGFLAG)..... 5444
65.6.31 Port Status & Control (USB_*n*PORTSC1)..... 5444
65.6.32 On-The-Go Status & control (USB_*n*OTGSC)..... 5451
65.6.33 USB Device Mode (USB_*n*USBMODE)..... 5455

65.6.34 Endpoint Setup Status (USB_*n*ENDPTSETUPSTAT)....5456
65.6.35 Endpoint Prime (USB_*n*ENDPTPRIME)....5457
65.6.36 Endpoint Flush (USB_*n*ENDPTFLUSH)....5458
65.6.37 Endpoint Status (USB_*n*ENDPTSTAT)....5458
65.6.38 Endpoint Complete (USB_*n*ENDPTCOMPLETE)....5459
65.6.39 Endpoint Control0 (USB_*n*ENDPTCTRL0)....5460
65.6.40 Endpoint Control 1 (USB_*n*ENDPTCTRL1)....5462
65.6.41 Endpoint Control 2 (USB_*n*ENDPTCTRL2)....5465
65.6.42 Endpoint Control 3 (USB_*n*ENDPTCTRL3)....5467
65.6.43 Endpoint Control 4 (USB_*n*ENDPTCTRL4)....5470
65.6.44 Endpoint Control 5 (USB_*n*ENDPTCTRL5)....5473
65.6.45 Endpoint Control 6 (USB_*n*ENDPTCTRL6)....5476
65.6.46 Endpoint Control 7 (USB_*n*ENDPTCTRL7)....5479

Chapter 66
Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

66.1 USB PHY Overview....5483
66.2 Operation....5484
66.2.1 UTMI....5485
66.2.2 Digital Transmitter....5485
66.2.3 Digital Receiver....5485
66.2.4 Analog Receiver....5485
66.2.4.1 HS Differential Receiver....5486
66.2.4.2 Squelch Detector....5487
66.2.4.3 LS/FS Differential Receiver....5487
66.2.4.4 HS Disconnect Detector....5487
66.2.4.5 USB Plugged-In Detector....5487
66.2.4.6 Single-Ended USB_DP Receiver....5488
66.2.4.7 Single-Ended USB_DN Receiver....5488
66.2.4.8 9X Oversample Module....5488

66.2.5 Analog Transmitter ... 5488
66.2.5.1 Switchable High-Speed 45Ω Termination Resistors ... 5488
66.2.5.2 Low-Speed/Full-Speed Differential Driver ... 5489
66.2.5.3 High-Speed Differential Driver ... 5489
66.2.5.4 Switchable 1.5KΩ USB_DP Pullup Resistor ... 5489
66.2.5.5 Switchable 15KΩ USB_DP Pulldown Resistor ... 5489
66.2.6 Recommended Register Configuration for USB Certification ... 5491
66.2.7 Charger detection ... 5491
66.2.7.1 Charger detect control table ... 5491
66.2.7.2 Data pin contact detector ... 5491
66.2.7.3 Charger detector ... 5492
66.2.7.4 Charger detection software flow ... 5492
66.2.7.5 Dead Battery Protect ... 5494
66.3 USB PHY Memory Map/Register Definition ... 5494
66.3.1 USB PHY Power-Down Register (USBPHY*x*_PWD*n*) ... 5497
66.3.2 USB PHY Transmitter Control Register (USBPHY*x*_TX*n*) ... 5499
66.3.3 USB PHY Receiver Control Register (USBPHY*x*_RX*n*) ... 5500
66.3.4 USB PHY General Control Register (USBPHY*x*_CTRL*n*) ... 5502
66.3.5 USB PHY Status Register (USBPHY*x*_STATUS) ... 5505
66.3.6 USB PHY Debug Register (USBPHY*x*_DEBUG*n*) ... 5507
66.3.7 UTMI Debug Status Register 0 (USBPHY*x*_DEBUG0_STATUS) ... 5509
66.3.8 UTMI Debug Status Register 1 (USBPHY*x*_DEBUG1*n*) ... 5510
66.3.9 UTMI RTL Version (USBPHY*x*_VERSION) ... 5511
66.4 USB Analog Memory Map/Register Definition ... 5511
66.4.1 USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECT*n*) ... 5513
66.4.2 USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECT*n*) ... 5514
66.4.3 USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT) ... 5516
66.4.4 USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT) ... 5518
66.4.5 USB Misc Register (USB_ANALOG_USB1_MISC*n*) ... 5519

66.4.6 USB VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECT*n*)..... 5520
66.4.7 USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECT*n*).....5522
66.4.8 USB VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT).....5524
66.4.9 USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT)..... 5526
66.4.10 USB Misc Register (USB_ANALOG_USB2_MISC*n*).....5527
66.4.11 Chip Silicon Version (USB_ANALOG_DIGPROG).....5528

Chapter 67
Ultra Secured Digital Host Controller (uSDHC)

67.1 Overview.....5529
67.1.1 Features..... 5532
67.1.2 Modes and Operations..... 5533
67.1.2.1 Data Transfer Modes.....5533
67.2 External Signals..... 5533
67.2.1 Signals Overview..... 5536
67.3 Clocks..... 5537
67.4 Functional Description.....5537
67.4.1 Data Buffer.....5537
67.4.1.1 Write Operation Sequence..... 5540
67.4.1.2 Read Operation Sequence..... 5540
67.4.1.3 Data Buffer and Block Size..... 5541
67.4.1.4 Dividing Large Data Transfer..... 5542
67.4.1.5 External DMA Request.....5543
67.4.2 DMA AHB Interface.....5544
67.4.2.1 Internal DMA Request..... 5545
67.4.2.2 DMA Burst Length..... 5546
67.4.2.3 AHB Master Interface.....5546
67.4.2.4 ADMA Engine..... 5546
67.4.2.4.1 ADMA Concept and Descriptor Format.....5547
67.4.2.4.2 ADMA Interrupt..... 5551

67.4.2.4.3 ADMA Error....5552
67.4.3 Register Bank with IP Bus Interface....5552
67.4.3.1 SD Protocol Unit....5553
67.4.3.2 SD control misc....5554
67.4.3.3 SD Clock control....5554
67.4.3.4 Command control....5554
67.4.3.5 Data control....5555
67.4.4 Clock & Reset Manager....5555
67.4.5 Clock Generator....5556
67.4.6 SDIO Card Interrupt....5556
67.4.6.1 Interrupts in 1-bit Mode....5556
67.4.6.2 Interrupt in 4-bit Mode....5556
67.4.6.3 Card Interrupt Handling....5557
67.4.7 Card Insertion and Removal Detection....5558
67.4.8 Power Management and Wake Up Events....5559
67.4.8.1 Setting Wake Up Events....5560
67.4.9 MMC fast boot....5560
67.4.9.1 Boot operation....5560
67.4.9.2 Alternative boot operation....5561
67.5 Initialization/Application of uSDHC....5562
67.5.1 Command Send & Response Receive Basic Operation....5562
67.5.2 Card Identification Mode....5563
67.5.2.1 Card Detect....5563
67.5.2.2 Reset....5564
67.5.2.3 Voltage Validation....5565
67.5.2.4 Card Registry....5567
67.5.3 Card Access....5568
67.5.3.1 Block Write....5568
67.5.3.1.1 Normal Write....5568

67.5.3.1.2 DDR Write....5570
67.5.3.1.3 Write with Pause....5570
67.5.3.2 Block Read....5572
67.5.3.2.1 Normal Read....5572
67.5.3.2.2 DDR Read....5573
67.5.3.2.3 Read with Pause....5573
67.5.3.2.4 DLL (Delay Line) in Read Path....5574
67.5.3.3 Suspend Resume....5576
67.5.3.3.1 Suspend....5576
67.5.3.3.2 Resume....5577
67.5.3.4 ADMA Usage....5577
67.5.3.5 Transfer Error....5578
67.5.3.5.1 CRC Error....5578
67.5.3.5.2 Internal DMA Error....5578
67.5.3.5.3 Transfer ADMA Error....5579
67.5.3.5.4 Auto CMD12 Error....5579
67.5.3.6 Card Interrupt....5580
67.5.4 Switch Function....5580
67.5.4.1 Query, Enable and Disable SDIO High Speed Mode....5581
67.5.4.2 Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50....5581

68.4.7 VDOA IPU External Buffer 0 Frame 1 Address Register (VDOA_VDOAIEBA01)..... 5670
68.4.8 VDOA IPU External Buffer 0 Frame 2 Address Register (VDOA_VDOAIEBA02)..... 5670
68.4.9 VDOA IPU External Buffer 1 Frame 0 Address Register (VDOA_VDOAIEBA10)..... 5670
68.4.10 VDOA IPU External Buffer 1 Frame 1 Address Register (VDOA_VDOAIEBA11)..... 5671
68.4.11 VDOA IPU External Buffer 1 Frame 2 Address Register (VDOA_VDOAIEBA12)..... 5671
68.4.12 VDOA IPU Stride Line Register (VDOA_VDOASL)..... 5672
68.4.13 VDOA IPU U (Chroma) Buffer Offset Register (VDOA_VDOAIUBO)..... 5672
68.4.14 VDOA VPU External Buffer 0 Address Register (VDOA_VDOAVEBA0)..... 5673
68.4.15 VDOA VPU External Buffer 1 Address Register (VDOA_VDOAVEBA1)..... 5673
68.4.16 VDOA VPU External Buffer 2 Address Register (VDOA_VDOAVEBA2)..... 5673
68.4.17 VDOA VPU U (Chroma) Buffer Offset Register (VDOA_VDOAVUBO)..... 5674
68.4.18 VDOA Status Register (VDOA_VDOASR)..... 5675

Chapter 69
Video Processing Unit (VPU)

69.1 Overview..... 5677
69.1.1 Features..... 5678
69.2 Modes of Operation..... 5680
69.2.1 Normal Operating Mode..... 5680
69.2.2 Low Power Mode..... 5680
69.3 Clocks..... 5680
69.4 Functional Description..... 5681
69.4.1 VPU Architecture..... 5681
69.4.1.1 Embedded BIT processor..... 5682
69.4.1.2 Video CODEC Hardware..... 5682
69.4.1.2.1 Inter-Predictor..... 5682
69.4.1.2.2 AC/DC and Intra-Predictor..... 5683
69.4.1.2.3 Inverse transform/Inverse quantization..... 5683
69.4.1.2.4 De-blocking/Overlap-smoothing filter..... 5683

69.4.1.2.5 Coefficient buffer interface....5683
69.4.1.2.6 Macroblock controller....5683
69.4.1.2.7 Rotation/Mirroring....5684
69.4.2 Reset....5685
69.4.3 Interrupts....5686
69.4.4 Endianness....5686
69.5 Initialization Information....5687
69.6 Application Information....5688
69.6.1 Video Decoding Processing Control....5688
69.6.1.1 Video Decoding Process Flow....5688
69.6.1.2 Video Decoding Process Command....5690
69.6.1.3 Video Decoding Process Finish Detection....5691
69.6.1.4 Video Decoding Process Flow Example....5692
69.6.2 Video Encoding Processing Control....5694
69.6.2.1 The Pipeline for Encoding....5694
69.6.3 Video Codec Processing Buffer Requirement....5698
69.6.3.1 Memory Map Types of Frame Buffer....5699
69.6.3.2 Frame Buffer....5700
69.6.3.3 BIT Processor Program Buffer....5702
69.6.3.4 Working Buffer....5703
69.6.3.5 Bitstream Buffer....5703
69.6.3.6 Parameter Buffer....5704
69.6.3.7 Search RAM....5704
69.6.3.8 Buffer Requirement Summary....5704
69.7 VPU Memory Map/Register Definition....5704
69.7.1 BIT Processor run start (VPU_CodeRun)....5706
69.7.2 BIT Boot Code Download Data register (VPU_CodeDown)....5706
69.7.3 Host Interrupt Request to BIT (VPU_HostIntReq)....5707
69.7.4 BIT Interrupt Clear (VPU_BitIntClear)....5708

69.7.5 BIT Interrupt Status (VPU_BitIntSts)....5709
69.7.6 BIT Current PC (VPU_BitCurPc)....5710
69.7.7 BIT CODEC Busy (VPU_BitCodecBusy)....5711

Chapter 70
Watchdog Timer (WDOG)

70.1 Overview....5713
70.1.1 Features....5714
70.2 External signals....5715
70.3 Clocks....5715
70.4 Watchdog mechanism and system integration....5715
70.5 Functional description....5717
70.5.1 Timeout event....5717
70.5.1.1 Servicing WDOG to reload the counter....5718
70.5.2 Interrupt event....5718
70.5.3 Power-down counter event....5718
70.5.4 Low power modes....5719
70.5.4.1 STOP and DOZE mode....5719
70.5.4.2 WAIT mode....5719
70.5.5 Debug mode....5720
70.5.6 Operations....5720
70.5.6.1 Watchdog reset generation....5720
70.5.6.2 WDOG_B generation....5720
70.5.7 Reset....5722
70.5.8 Interrupt....5723
70.5.9 Flow Diagrams....5723
70.6 Initialization....5725
70.7 WDOG Memory Map/Register Definition....5726
70.7.1 Watchdog Control Register (WDOG*x*_WCR)....5726
70.7.2 Watchdog Service Register (WDOG*x*_WSR)....5728

70.7.3 Watchdog Reset Status Register (WDOG*x*_WRSR)..... 5729
70.7.4 Watchdog Interrupt Control Register (WDOG*x*_WICR)..... 5730
70.7.5 Watchdog Miscellaneous Control Register (WDOG*x*_WMCR)..... 5731

Chapter 71
Crystal Oscillator (XTALOSC)

71.1 Overview..... 5733
71.2 External Signals..... 5733
71.3 Crystal Oscillator 24 MHz..... 5734
71.3.1 Oscillator Configuration (24 MHz)..... 5734
71.3.2 Crystal Frequency Detection(24 MHz)..... 5735
71.4 Crystal Oscillator 32 kHz..... 5736
71.4.1 Oscillator Configuration (32 kHz)..... 5736
71.4.2 Bypass Configuration (32 kHz)..... 5737
71.5 XTALOSC 24MHz Memory Map/Register Definition..... 5737
71.5.1 Miscellaneous Register 0 (XTALOSC24M_MISC0*n*)..... 5739

Chapter 1
Introduction

1.1 About This Document

The i.MX 6Solo/6DualLite application processors are NXP's latest additions to a growing family of real-time processing products offering high-performance processing optimized for lowest power consumption.

The i.MX 6Solo/6DualLite processors feature NXP's advanced implementation of the ARM®Cortex®-A9 core.

The processors can be interfaced with DDR3, DDR3L LPDDR2 (single and dual channel) DRAM memory devices.

These products are suitable for applications such as:

- Automotive navigation and entertainment
- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- High-end portable media players with HD video capability
- Portable navigation devices
- Gaming Consoles

1.1.1 Audience

The reference manual is intended for the board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands the concepts of the digital system design, microprocessor architecture, input/output (I/O) devices, industry standard communication, and device interface protocols.

1.1.2 Organization

The reference manual describes the chip at a system level and provides an architectural overview. It also describes the system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

1.1.3 Suggested Reading

This section lists the additional resources that provide background for the information in this manual, as well as general information about the architecture.

1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex processor.

For information about the ARM Cortex processor see:

- **http://infocenter.arm.com**

1.1.3.2 Related Documentation

For a current list of documentation, refer to **http://www.nxp.com**.

1.1.4 Conventions

The reference manual uses the following notational conventions:

cleared / set
When a bit has a value of zero, it is said to be cleared; when it has a value of one, it is said to be set.

mnemonics
Instruction mnemonics are shown in lowercase bold.

italics
Italics indicate variable command parameters, for example, **bcctr***x*.

The book titles in the text are set in italics.

15
An integer in decimal.

0x
the prefix to denote a hexadecimal number.

0b
The prefix to denote a binary number. Binary values of 0 and 1 are written without a prefix.

n'H4000CA00
The n-bit hexadecimal number.

BLK_REG_NAME
The register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (_).

BLK_REG[FIELD]
The fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK_REG[*n*]
The bit number *n* within the BLK.REG register.

BLK_REG[*l:r*]
The register bit ranges. The ranges are indicated by the left-most bit number *l* and the right-most bit number *r*, separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

x, U
In some contexts, such as signal encodings, an unitalicized x indicates a "don't care" or "uninitialized". The binary value can be 1 or 0.

x
An italicized *x* indicates an alphanumeric variable.

n, m
Italicized *n or m* represent integer variables.

!
Binary logic operator NOT.

&&
Binary logic operator AND.

||
Binary logic operator OR.

^ or <O+>
Binary logic operator XOR. For example, A <O+> B.

|
Bit-wise OR. For example, 0b0001 | 0b1000 yields the value of 0b1001.

&
Bit-wise AND. For example, 0b0001 and 0b1000 yields the value of 0b0000.

{A,B}

Concatenation, where the *n*-bit value A is prepended to the *m*-bit value B to form an (*n* +*m*)-bit value. For example, {0, REG*m* [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in a register. Although these bits can be written to with ones or zeros, they always read zeros.

>>

Shift right logical one position.

<<

Shift left logical one position.

<=

Assignment.

==

Compare equal.

!=

Compare not equal.

>

Greater than.

<

Less than.

1.1.5 Register Access

1.1.5.1 Register Diagram Field Access Type Legend

This figure provides the interpretation of the notation used in the register diagrams for a number of common field access types:

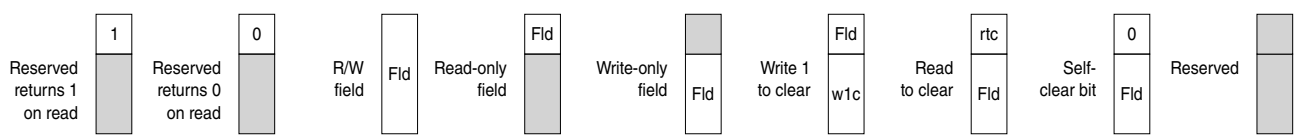

Figure 1-1. Register Field Conventions

NOTE

For reserved register fields, the software should mask off the data in the field after a read (the software can't rely on the contents of data read from a reserved field) and always write all zeros.

1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all the bits set to 1 perform the associated operation on the primary register, while the bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one-bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read-modify-write operations. When an atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix _SET, _CLR, or _TOG is added to the base name of the register. For example, the CCM_ANALOG_PLL_ARM register has three other registers called CCM_ANALOG_PLL_ARM_SET, CCM_ANALOG_PLL_ARM_CLR, and CCM_ANALOG_PLL_ARM_TOG.

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has the SCT register set. There is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is CCM_ANALOG_PLL_ARM*n*. When you see this designation, there is a SCT register set associated with the register, and you can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

In this example, the address for each of the base registers and their three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20c_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

1.1.6 Signal Conventions

_b, _B

When appended to a signal name, this indicates that a signal is active-low.

$\overline{\text{NEG_ACTIVE}}$

Overbar also denotes a negative active signal.

UPPERCASE

Package pin names, Block I/O signals.

lowercase

Lowercase is used to indicate internal signals.

1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	Arm IP Bus
ALU	Arithmetic Logic Unit

Table continues on the next page...

Term	Meaning
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BIST	Built-In Self Test
CA/CM	Arm Cortex-A/Cortex-M
CAAM	Cryptographic Acceleration and Assurance Module
CAN	Controller Area Network
CCM	Clock Controller Module
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
ECSPI	Enhanced Configurable SPI
EDMA	Enhanced Direct Memory Access
EIM	External Interface Module
ENET	Ethernet
EPDC	Electrophoretic Display Controller
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
GPV	Global Programmers View
HAB	High-Assurance Boot
I2C or I^2C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers

Table continues on the next page...

Term	Meaning
IOMUX	Input-Output Multiplexer
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MCM	Miscellaneous control Module
MMC	Multimedia Card
MMDC	Multi Mode DDR Controller
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect
PCIe	PCI express
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
ROMCP	ROM Controller with Patch
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA

Table continues on the next page...

Term	Meaning
SIM	Subscriber Identification Module
SNVS	Secure Non-Volatile Storage
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface
TSGEN	Time Stamp Generator
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

1.2 Introduction

This chapter introduces the architecture of the i.MX 6Solo/6DualLite Multimedia Applications Processors. The i.MX 6Solo/6DualLite processors represent NXP's latest achievement in integrated multimedia applications processors.

It is part of a growing i.MX family of multimedia-focused products, offering high-performance processing optimized for the lowest power consumption.

1.3 Target Applications

The i.MX 6Solo/6DualLite applications processor is tailored for use in multimedia-centric smart mobile devices, driver information systems including infotainment and graphical instrument clusters, and portable medical devices.

The architecture's flexibility enables it to be used in a wide variety of general embedded applications. The i.MX 6Solo/6DualLite processor provides all interfaces necessary to connect peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

1.4 Features

The i.MX 6Solo/6DualLite processors are based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

- The i.MX 6Solo supports single ARM Cortex-A9 MPCore (with TrustZone)
- The i.MX 6DualLite supports dual ARM Cortex-A9 MPCore (with TrustZone)

The core configuration is symmetric, where each core includes:

- 32 KByte L1 Instruction Cache
- 32 KByte L1 Data Cache
- Private Timer and Watchdog
- Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 512 KB unified I/D L2 cache:
  - Used by one core in i.MX 6Solo
  - Shared by two cores in i.MX 6DualLite
- Two Master AXI (32-bit) bus interfaces output of L2 cache

Target frequency of the core (including Neon and L1 cache) is 800 MHz non-overdrive over the specified temperature range:

- 1 GHz overdrive over the specified temperature range
- 800 MHz non-overdrive over the specified temperature range
- NEON MPE coprocessor
- SIMD Media Processing Architecture
- NEON register file with 32x64-bit general-purpose registers
- NEON Integer execute pipeline (ALU, Shift, MAC)
- NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
- NEON load/store and permute pipeline
- Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
- Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

The memory system consists of the following components:
- Level 1 Cache—32 KB Instruction, 32 KB Data cache per core
- Level 2 Cache—Unified instruction and data (256 KB)

On-Chip Memory:
- Boot ROM, including HAB (96 KB)
- Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- Secure/non-secure RAM (16 KB)

External memory interfaces:

The i.MX 6Solo/6DualLite processors support latest, high volume, cost effective handheld DRAM, NOR, and NAND Flash memory standards.

- In i.MX 6Solo, 16/32-bit LP-DDR2-800, 16/32-bit DDR3-800, and LV-DDR3-800
- In i.MX 6DualLite, 16/32/64-bit LP-DDR2-800, 16/32/64-bit DDR3-800, and LV-DDR3-800
- 8-bit NAND-Flash, including support for Raw MLC/SLC, 2 KB, 4 KB, and 8 KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others.
- BCH ECC up to 40 bit.
- 16/32-bit NOR Flash. All EIMv2 pins are muxed on other interfaces.
- 16/32-bit PSRAM, Cellular RAM

Each i.MX 6Solo/6DualLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):
- Displays—Total four interfaces available. Total raw pixel rate of all interfaces is up to 266 Mpixels/sec, 24 bpp. Up to three interfaces may be active in parallel (excluding EPDC).
- One Parallel 24-bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz or dual HD1080 and WXGA at 60 Hz)
- LVDS serial ports—One port up to 170 Mpixels/sec or two ports up to 85 MP/sec (for example, WUXGA at 60 Hz) each
- HDMI 1.4 port
- MIPI/DSI, two lanes at 1 Gbps
- EPDC, Color, and monochrome E-INK, up to 1650x2332 resolution and 5-bit grayscale

Camera sensors:
- Up to two interfaces may be active at once
- Parallel Camera port (up to 20 bit and up to 240 MHz peak)
- MIPI CSI-2 / Parallel port, supporting from 80 Mbps to 800 Mbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to two data lanes. Each i.MX 6Solo/6DualLite processor has two lanes.

Expansion cards:

Four MMC/SD/SDIO card ports all supporting:

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- Compatible with SD Memory, miniSD Memory, SDIO, miniSDIO, SD Combo, MMC and MMC RS, embedded MMC and embedded SD cards
- Host clock frequency variable between 32kHz to 52 MHz
- Up to 200 Mbps data transfer for SD/SDIO cards using 4 parallel data lines
- Up to 416 Mbps data transfer for MMC cards using 8 parallel data lines
- Up to 832 Mbps data transfer for MMC/SD cards using 8 parallel data lines in DDR mode
- Supports Single Block, Multi Block and Byte
- Dual internal 32x32-bit FIFOs

USB:

- One High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
- Three USB 2.0 (480 Mbps) hosts:
- One HS host with integrated High Speed Phy
- Two HS hosts with integrated HS-IC USB (High Speed Inter-Chip USB) Phy

Expansion PCI Express port (PCIe) v2.0 one lane:

- PCI Express (Gen 2.0) dual mode complex, supporting Root complex operations and Endpoint operations. Uses x1 PHY configuration.

Miscellaneous IPs and interfaces:

- Three I2S/SSI/AC97, up to 1.4 Mbps each
- Enhanced Serial Audio Interface (ESAI), up to 1.4 Mbps per channel
- Five UARTs, up to 4.0 Mbps each:
  - Providing RS232 interface
  - Supporting 9-bit RS485 multidrop mode
  - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
- Four eCSPI (Enhanced CSPI). Using chip selects to support multiple peripherals
- Four I2C, supporting 400 kbps
- Gigabit Ethernet Controller (IEEE1588 compliant), 10/100/1000 Mbps
- Four Pulse Width Modulators (PWM)

- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbps each
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)
- MLB (MediaLB) provides interface to MOST Networks (MOST25, MOST50, MOST150) with the option of DTCP cipher accelerator

The i.MX 6Solo/6DualLite processors integrate advanced power management unit and controllers:

- Provide PMU, including DCDC and LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6Solo/6DualLite processors use dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6Solo/6DualLite processors incorporate the following hardware accelerators:

- VPU—Video Processing Unit
- IPUv3H—Image Processing Unit version 3H
- GPU3Dv5—3D Graphics Processing Unit (OpenGL ES 2.0) version 5
- GPU2Dv2—2D Graphics Processing Unit (BitBlt)
- PXP—PiXel Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.
- ASRC—Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing cryptographic and hash engines, 16 KB secure RAM, and True and Pseudo Random Number Generator (NIST certified).
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock

- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSEs and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

NOTE

The actual feature set depends on the part number. Functions, such as video hardware acceleration, and 2D and 3D hardware graphics acceleration may not be enabled for specific part numbers.

1.5 Architectural Overview

This section contains details about the chip architecture.

1.5.1 Block Diagram

A simplified block diagram is provided in the following section.

1.5.1.1 Simplified Block Diagram

A high-level block diagram is shown in the following figure. This diagram provides a view of the chip's major sub-systems (processor domains, shared peripherals domain, and memories) and logical connectivity.

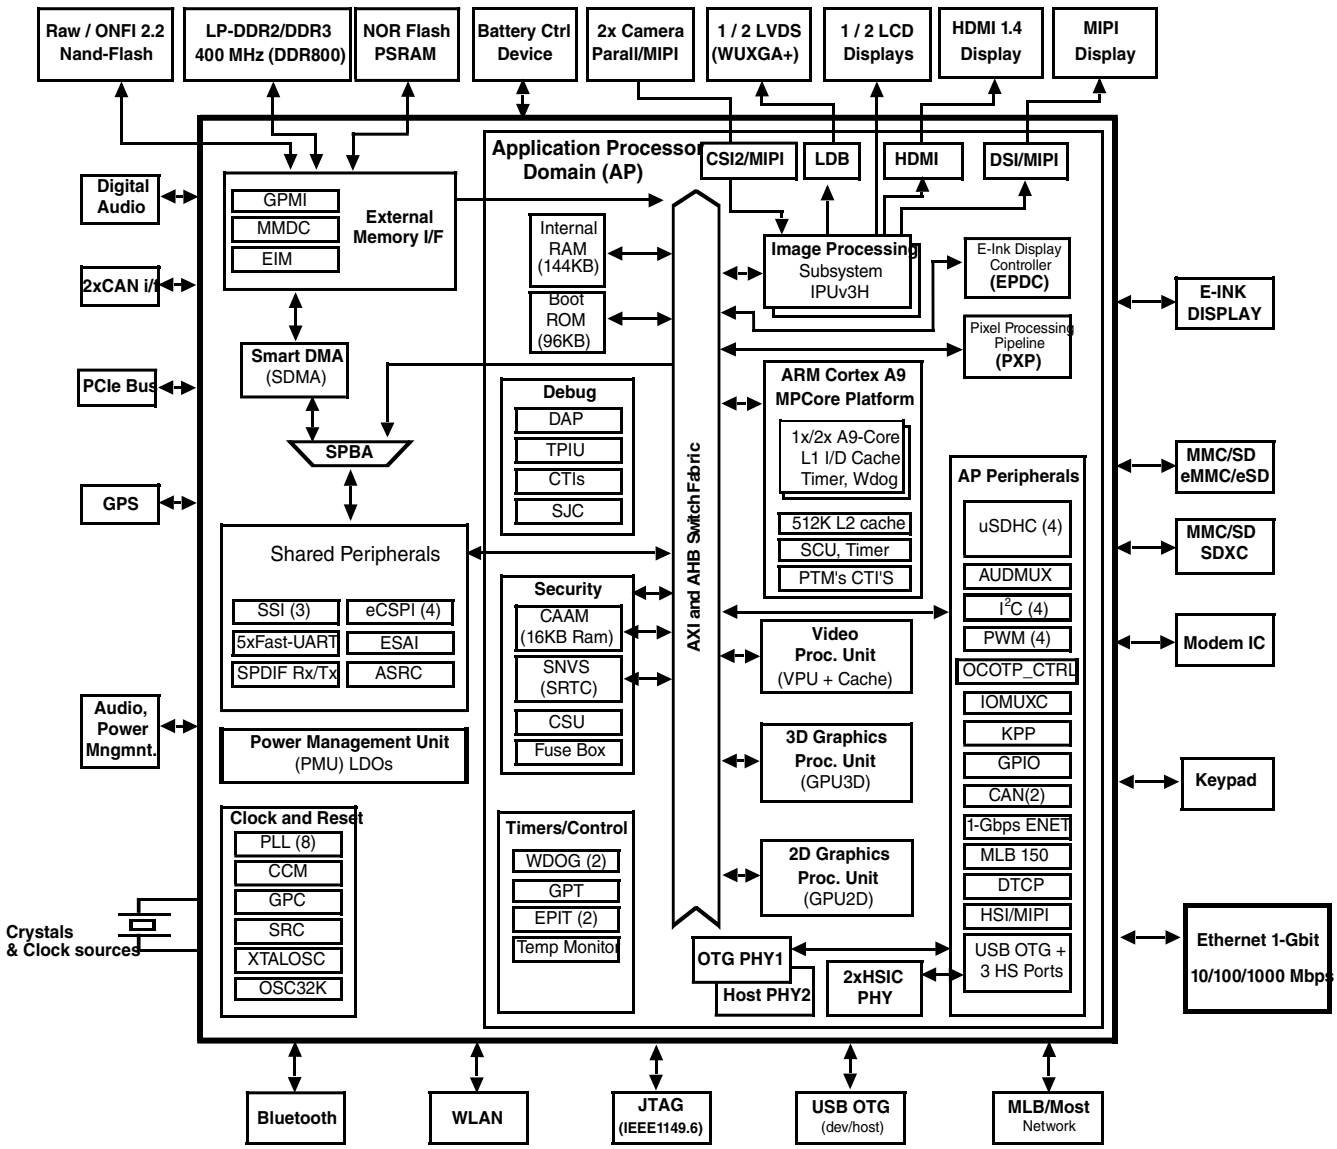

Figure 1-2. Simplified block diagram

1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ Platform provides hardware features for:
  - Operating System
  - User applications (including control over hardware accelerators and non-accelerated functions)
  - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
  - Clock Control Module (CCM)
  - Eight PLLs and two PFDs
  - XTALOSC- 24 MHz Crystal oscillator source support
  - OSC32KHz - 32.768 Hz Crystal oscillator source support
  - System Reset Controller (SRC)
  - General Power Controller (GPC)
  - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
  - One Image Processing Unit-IPUv3H
    - Connectivity to displays and controllers (Parallel, LVDS, MIPI, HDMI), cameras (parallel, MIPI).
    - Display Processing: video/graphics combining, image enhancement
    - Image conversions: resizing, rotation/inversion, color conversion, de-interlacing
    - Synchronization and control capabilities, allowing autonomous operation
  - Video Processing Unit (VPU), supports various decoding/encoding formats in HW, up to 1080p plus SD 30 fps decoding (H.264, VC1, RV10, DivX, etc.), and up to 1080p 30 fps encoding (H.264, etc.).
  - Graphics Processing Unit (GPU3Dv5) graphics processing compliant with the following:
    - OpenGL ES 1.1 and 2.0 including extensions.
    - Windows Direct3D
  - Graphics Processing Unit (GPU2Dv2)
  - Audio
    - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
    - 3x SSIs
    - ESAI
    - SPDIF Tx/Rx
    - Audmux
    - Audio sample rate conversion accelerator (ASRC)
- Security is supported by:
  - High Assurance Boot (HAB4) System
  - ARM TrustZone (TZ) Trusted Execution environment
  - DDR Memory secure region protection by TrustZone Address Space Controller
  - On-chip RAM (OCRAM) single region TrustZone protection
  - Peripheral access policy control, using Central Security Unit (CSU)

    - One-Time Programmable (OTP) electrical fuse array (Total of 3840-bit e-fuses) via the On-chip electrical fuse controller (OCOTP_CTRL)
    - CAAM and SNVS security architecture, providing:
        - 16 KB Secure RAM
        - Secure Real Time Counters
        - Security State Controller
        - Encryption and Hashing functions, Random Number Generator (RNG)
        - Security Violation/Tamper Detection & Reporting
    - System JTAG controller (SJC)
    - Secure Real Time Clock (SRTC)
    - TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
    - Embedded DMAs
    - 3.3V IO voltage for seamless integration
    - Four USB 2.0 ports, including four PHYs: 2x HS-USB (OTG) and 2x HS-IC USB integrated PHYs
    - Memory, 800 MT/s per Line, supports LP-DDR2 (2x16, 2x32, 2x32 interleaved mode - x64), DDR3 (x16/x32/x64) and DDR3L (x16/x32/x64)
    - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller
    - Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
    - Miscellaneous connectivity support - PCIe, FLEXCAN, MLB, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

1.5.3 Endianness Support

The chip supports only the Little Endian mode.

1.5.4 Memory Interfaces

The chip DDR controller supports these memory interfaces:

- LP-DDR2-800, 1x32 channel for i.MX 6Solo and 2x32 channels for i.MX 6DualLite, 400-MHz clock
- DDR3/DDR3L 32-bit in i.MX 6Solo, DDR3/LV-DDR3 32/64-bit in i.MX 6DualLite, both 400-MHz clocks.

NAND flash controller supports the following:

- Eight NAND flash buses
- Configurable page size of 2 KB, 4 KB, or 8 KB
- Configurable spare area per page of up to 512 B
- Supports interleaved accesses to up to eight NAND devices
- Legacy raw SLC-type and MLC-type devices
- Supports up to 40-bit ECC by the hardware BCH ECC accelerator, capable of 200 MB/s encode/decode rate
- ONFI2.2-compliant
  - Timing modes 0-5 for both the asynchronous and synchronous I/F. A synchronous clock rate of up to 100 MHz with a data rate of up to 200 MB/s.
- Vendor-specific devices: BA-NAND (Micron), PBA-NAND and LBA-NAND (Toshiba), E2-NAND (Hynix), EF-NAND (Samsung), Samsung's "Toggle-mode" NAND (clock rate of up to 66 MHz and 80 MHz, with a data rate of up to 133 MB/s and 160 MB/s respectively)

The EIM block provides an interface for SRAM and PSRAM, and a 16/8-bit NOR flash. All EIM pins are muxed on other interfaces.

Chapter 2
Memory Maps

2.1 Memory system overview

This section introduces the memory architecture of the chip.

NOTE

Accessing the reserved memory regions can result in unpredictable behavior.

2.2 Arm Platform Memory Map

The chip memory map has been provided in the following tables. The mapping of the DDR memory address space can be configured by software or hardware fuses, depending on the memory device type (LPDDR2/DDR2/DDR3) and the selected interleaving/non-interleaving scheme.

A combined memory map (of both the 2x32 and x64) is shown in this table:

Table 2-1. System memory map

Start address	End address	Size	Description
1000_0000	FFFF_FFFF	3840 MB	MMDC—DDR Controller. See DDR mapping to MMDC controller ports.
0800_0000	0FFF_FFFF	128 MB	EIM—(NOR/SRAM)
02A0_0000	02DF_FFFF	4 MB	Reserved
0260_0000	029F_FFFF	4 MB	IPU
0220_C000	023F_FFFF	2 MB	Reserved
0220_8000	0220_BFFF	16 KB	MIPI_HSI
0220_4000	0220_7FFF	16 KB	Reserved
0220_0000	0220_3FFF	16 KB	Reserved
0210_0000	021F_FFFF	1 MB	Peripheral IPs via AIPS-2. See Table 2-3.

Table continues on the next page...

Table 2-1. System memory map (continued)

Start address	End address	Size	Description
0200_0000	020F_FFFF	1 MB	Peripheral IPs via AIPS-1. See Table 2-2.

0214_0000	0214_0FFF		DAP ROM Table	4 KB

NOTE

Accessing the reserved memory regions can result in unpredictable behavior.

2.3 DDR mapping to MMDC controller ports

The following table lists the various DDR configuration modes and how each mode is mapped to the DDR channels.

Memory Mapping Mode	DDR Memory Map Config[1:0] fuse value	Start Address	End Address	Total Size	MMDC channel/ports
X32/X64-bit, fixed mapping	‘00’	1000_0000	FFFF_FFFF	3840 MB	MMDC #0
Dual-channel (2x 32-bit), Fixed mapping (LPDDR2)	‘01’	8000_0000	FFFF_FFFF	2048 MB	MMDC #0
		1000_0000	7FFF_FFFF	1792 MB	MMDC #1
Dual channel (2x 32-bit), Interleaved mapping (LPDDR2) [1]	‘10’	1000_0000	FFFF_FFFF	3840 MB	MMDC #0 , MMDC #1 (interleaved data)
Illegal	'11'				

1. In the 4KB interleaving mode the system bus maps each consecutive 4KB region to a 4KB region in the other MMDC port, such that "odd" 4KB spaces are mapped to MMDC0, and "even" 4KB regions mapped to MMDC1.

2.4 DMA memory map

The Smart DMA memory map is shown in the following table.

Table 2-5. SDMA peripheral memory map

Peripheral	Base address	Size
Reserved for SDMA internal memory	0x0000	4 KB
SPDIF	0x1000	4 KB
eCSPI1	0x2000	4 KB
eCSPI2	0x3000	4 KB
eCSPI3	0x4000	4 KB
eCSPI4	0x5000	4 KB
Reserved	0x6000	4 KB
Reserved for SDMA internal registers	0x7000	4 KB
UART1	0x8000	4 KB
ESAI	0x9000	4 KB
SSI1	0xA000	4 KB
SSI2	0xB000	4 KB
SSI3	0xC000	4 KB
ASRC	0xD000	4 KB
Reserved	0xE000	4 KB
SPBA Registers	0xF000	4 KB

NOTE

Accessing the reserved memory regions can result in an unpredictable behavior.

Chapter 3
Interrupts and DMA Events

3.1 Overview

This section describes the assignments of interrupts from the Arm domain in Cortex A9 interruptsand from the DMA events in SDMA event mapping.

3.2 Cortex A9 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all chip sources and provides an interface to the Cortex A9 CPU cores. The first 32 interrupts are private to the CPUs' interface. These interrupts are not included in the table below. All interrupts besides those private to the CPU are hooked up to the GPC.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. This table describes the Arm Cortex A9 interrupt sources:

Table 3-1. Arm Cortex A9 domain interrupt summary

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General-Purpose Register 1 from IOMUXC. Used to notify the cores on the exception condition while booting.
33	DAP	Debug Access Port interrupt request
34	SDMA	SDMA interrupt request from all channels
35	VPU	JPEG codec interrupt request
36	SNVS	PMIC power off request
37	IPU	IPU error interrupt request
38	IPU1	IPU1 sync interrupt request
39	Reserved	Reserved
40	Reserved	Reserved

Table continues on the next page...

Table 3-1. Arm Cortex A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
41	GPU3D	GPU3D interrupt request
42	R2D GPU2D	R2D GPU2D general interrupt request
43	Reserved	Reserved
44	VPU	VPU interrupt request
45	APBH DMA	Logical OR of APBH DMA channels 0-3 completion and error interrupts
46	EIM	EIM interrupt request
47	BCH	BCH operation complete interrupt
48	GPMI	GPMI operation timeout error interrupt
49	DTCP	DTCP interrupt request
50	VDOA	VDOA interrupt request
51	SNVS	SRTC consolidated interrupt
52	SNVS	SRTC security interrupt
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request
56	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request
57	uSDHC4	uSDHC4 (Enhanced SDHC) interrupt request
58	UART1	UART1 interrupt request
59	UART2	UART2 interrupt request
60	UART3	UART3 interrupt request
61	UART4	UART4 interrupt request
62	UART5	UART5 interrupt request
63	eCSPI1	eCSPI1 interrupt request
64	eCSPI2	eCSPI2 interrupt request
65	eCSPI3	eCSPI3 interrupt request
66	eCSPI4	eCSPI4 interrupt request
67	I2C4	I2C4 interrupt request
68	I2C1	I2C1 interrupt request
69	I2C2	I2C2 interrupt request
70	I2C3	I2C3 interrupt request
71	Reserved	Reserved
72	USB	USB Host 1 interrupt request
73	USB	USB Host 2 interrupt request
74	USB	USB Host 3 interrupt request
75	USB	USB OTG interrupt request
76	USB_PHY	UTMI0 interrupt request
77	USB_PHY	UTMI1 interrupt request
78	SSI1	SSI1 interrupt request

Table continues on the next page...

Table 3-1. Arm Cortex A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
79	SSI2	SSI2 interrupt request
80	SSI3	SSI3 interrupt request
81	Temperature Monitor	Temperature Sensor (temperature greater than threshold) interrupt request
82	ASRC	ASRC interrupt request
83	ESAI	ESAI interrupt request
84	SPDIF	SPDIF interrupt
85	MLB150	MLB error interrupt request
86	PMU	PMU analog regulator brownout occurred.
87	GPT	Logical OR of GPT rollover interrupt line, input capture 1 and 2 lines, output compare 1, 2, and 3 interrupt lines
88	EPIT1	EPIT1 output compare interrupt
89	EPIT2	EPIT2 output compare interrupt
90	GPIO1	INT7 interrupt request
91	GPIO1	INT6 interrupt request
92	GPIO1	INT5 interrupt request
93	GPIO1	INT4 interrupt request
94	GPIO1	INT3 interrupt request
95	GPIO1	INT2 interrupt request
96	GPIO1	INT1 interrupt request
97	GPIO1	INT0 interrupt request
98	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15
99	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31
100	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15
101	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31
102	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15
103	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31
104	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15
105	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31
106	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15
107	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31
108	GPIO6	Combined interrupt indication for GPIO6 signals 0 - 15
109	GPIO6	Combined interrupt indication for GPIO6 signals 16 - 31
110	GPIO7	Combined interrupt indication for GPIO7 signals 0 - 15
111	GPIO7	Combined interrupt indication for GPIO7 signals 16 - 31
112	WDOG1	WDOG1 timer reset interrupt request
113	WDOG2	WDOG2 timer reset interrupt request
114	KPP	Key Pad interrupt request
115	PWM1	Cumulative interrupt line for PWM1. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.

Table continues on the next page...

Table 3-1. Arm Cortex A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
116	PWM2	Cumulative interrupt line for PWM2. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
117	PWM3	Cumulative interrupt line for PWM3. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
118	PWM4	Cumulative interrupt line for PWM4. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
119	CCM	CCM interrupt request 1
120	CCM	CCM interrupt request 2
121	GPC	GPC interrupt request 1
122	Reserved	Reserved
123	SRC	SRC interrupt request
124	CPU	L2 interrupt request
125	CPU	Parity Check error interrupt request
126	CPU	Performance Unit interrupt
127	CPU	CTI trigger outputs interrupt
128	SRC	Combined CPU WDOG interrupts out of SRC
129	EPDC	EPDC interrupt request
130	PXP	PXP interrupt request
131	Reserved	Reserved
132	MIPI_CSI	CSI interrupt request 1
133	MIPI_CSI	CSI interrupt request 2
134	MIPI_DSI	DSI interrupt request
135	MIPI_HSI	HSI interrupt request
136	SJC	SJC interrupt from the General-Purpose register
137	CAAM	CAAM job ring 0 interrupt
138	CAAM	CAAM job ring 1 interrupt
139	Reserved	Reserved
140	TZASC1	TZASC1 interrupt request
141	TZASC2	TZASC2 interrupt request
142	FLEXCAN1	FLEXCAN1 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein. Combined interrupt of ini_int_busoff,ini_int_error,ipi_int_mbor,ipi_int_txwarning and ipi_int_waken
143	FLEXCAN2	FLEXCAN2 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
144	Reserved	Reserved
145	Reserved	Reserved
146	Reserved	Reserved
147	HDMI	HDMI video and CEC control interrupt request.
148	HDMI	HDMI CEC dedicated wake-up interrupt.

Table continues on the next page...

Table 3-1. Arm Cortex A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
149	MLB150	Interrupt request for channels [31:0]. Interrupt request for channels [63:32] available on IRQ #149 if SMX bit is set in MLB150 AHB control register (ACTL), otherwise interrupt for channels [63:32] interrupt is available on IRQ #158.
150	ENET	ENET Interrupt Request
151	ENET	ENET 1588 Timer interrupt [synchronous] request
152	PCIe	PCIe interrupt request 1
153	PCIe	PCIe interrupt request 2
154	PCIe	PCIe interrupt request 3
155	PCIe	PCIe interrupt request 4
156	DCIC1	DCIC1 interrupt request
157	DCIC2	DCIC2 interrupt request
158	MLB150	Interrupt request for channel[63:32]. If SMX bit is not set in MLB150 AHB control register (ACTL), it is the default working mode.
159	PMU	PMU digital regulator brownout occurred.

3.3 SDMA event mapping

This table shows the DMA request signals for the peripherals in the chip:

Table 3-2. SDMA event mapping

Event Number	DMA Source	Description
0	VPU	VPU DMA request
1	I2C4	I2C4 DMA event
2	IPU / IOMUX	IPU-1 DMA Event; Muxed with external DMA pad #1, controlled by GPR0[0]
3	eCSPI1 / I2C3	eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[1]
4	eCSPI1 / I2C2	eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[2]
5	eCSPI2 / I2C1	eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[3]
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3	eCSPI3 Rx request
8	eCSPI3	eCSPI3 Tx request
9	eCSPI4 / EPIT2	eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[5]
10	eCSPI4/ I2C1	eCSPI4 Tx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4]
11	Reserved	Reserved
12	Reserved	Reserved
13	GPT	GPT counter event

Table continues on the next page...

Table 3-2. SDMA event mapping (continued)

Event Number	DMA Source	Description
14	SPDIF / IOMUX	SPDIF RX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[7]
15	SPDIF	SPDIF TX DMA request
16	EPIT1	EPIT1 request
17	ASRC	ASRC DMA1 request (Pair A input Request)
18	ASRC	ASRC DMA2 request (Pair B input Request)
19	ASRC	ASRC DMA3 request (Pair C input Request)
20	ASRC	ASRC DMA4 request (Pair A output Request)
21	ASRC	ASRC DMA5 request (Pair B output Request)
22	ASRC	ASRC DMA6 request (Pair C output Request)
23	ESAI / I2C3	ESAI Rx FIFO DMA request; Muxed with I2C3 controlled by IOMUXC register GPR0[6]
24	ESAI	ESAI Tx FIFO DMA request
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3	UART3 Rx FIFO
30	UART3	UART3 Tx FIFO
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5	UART5 Rx FIFO
34	UART5	UART5 Tx FIFO
35	SSI1	SSI1 receive 1 DMA request
36	SSI1	SSI1 transmit 1 DMA request
37	SSI1	SSI1 receive 0 DMA request
38	SSI1	SSI1 transmit 0 DMA request
39	SSI2	SSI2 receive 1 DMA request
40	SSI2	SSI2 transmit 1 DMA request
41	SSI2	SSI2 receive 0 DMA request
42	SSI2	SSI2 transmit 0 DMA request
43	SSI3	SSI3 receive 1 DMA request
44	SSI3	SSI3 transmit 1 DMA request
45	SSI3	SSI3 receive 0 DMA request
46	SSI3	SSI3 transmit 0 DMA request
47	DTCP	DTCP DMA request

As shown in the table, some of the events are the output of a mux of two signals or triggers. The selection of this mux is controlled by the general-purpose registers in IOMUXC.

Chapter 4
External Signals and Pin Multiplexing

4.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal-to-pin and pin-to-signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

Pin Assignments lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. The muxing options table lists the external signals grouped by the module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

4.1.1 Pin Assignments

Table 4-1. Pin Assignments

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
BOOT_MODE0		SRC_BOOT_MODE0		
BOOT_MODE1		SRC_BOOT_MODE1		
CLK1_N		XTALOSC_CLK1_N		
CLK1_P		XTALOSC_CLK1_P		
CLK2_N		XTALOSC_CLK2_N		
CLK2_P		XTALOSC_CLK2_P		
CSI0_DAT4	ALT0	IPU1_CSI0_DATA04	HYS - ENABLED	SW_PAD_CTL_PAD_CSI0_DATA04
	ALT1	EIM_DATA02	PUS - 100K_OHM_PU	
	ALT2	ECSPI1_SCLK	PUE - PULL	
	ALT3	KEY_COL5	PKE - ENABLED	
	ALT4	AUD3_TXC	ODE - DISABLED	
	ALT5	GPIO5_IO22	SPEED - 100MHZ	
	ALT7	ARM_TRACE01	DSE - 40_OHM	

Table continues on the next page...

XTALOSC_RTC_XTALI	RTC_XTALI	Not multiplexed.
XTALOSC_RTC_XTALO	RTC_XTALO	Not multiplexed.
XTALOSC_XTALI	XTALI	Not multiplexed.
XTALOSC_XTALO	XTALO	Not multiplexed.

Chapter 5
Fusemap

5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices. A separate map is given for each and every boot device. The device select is specified by BOOT_CFG1[7:3] fuses listed in Table 5-1. In Table 5-2, the "Address Offset" means the address offset compared with the OCOTP_CTRL base address, which is 0x21B_C000.

Table 5-1. Boot Device Select

Boot Device	BOOT _CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]	BOOT_CFG1[3]
EIM (Table 5-3)	0	0	0	0	Memory Type: 0 - NOR Flash 1 - OneNAND
Serial ROM (Table 5-4)	0	0	1	1	X
SD/eSD (Table 5-5)	0	1	0	X	X
MMC/eMMC (Table 5-6)	0	1	1	X	X
NAND Flash (Table 5-7)	1	X	X	X	X

NOTE

Fuses marked as “Reserved” are reserved for NXP internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either ‘0’ or ‘1’.

Table 5-2. Lock Fuses

Address Offset	7	6	5	4	3	2	1	0
0x400[7:0]	Reserved	SJC_RESP_LOCK WRP,OP,RDP	MEM_TRIM_LOCK 1x - OP x1 - WP		BOOT_CFG_LOCK (Locking rows: 0x450-0x470) 1x - OP x1 - WP		TESTER_LOCK 1x - OP x1 - WP

5.2 Fusemap Description Table

This section covers the fusemap descriptions of the chip.

Table 5-8. Fusemap Descriptions

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x400[1:0]	TESTER_LOCK	2	Provides Locking of various fuse bits.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[3:2]	BOOT_CFG_LOCK	2	Perform lock on BOOT related fuses.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[5:4]	MEM_TRIM_LOCK	2	Trimming fuses. Burned on the tester or by customer before the final product shipment.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[6]	SJC_RESP_LOCK	1	Lock bit for JTAG response fuses. (SJC_RESP)	0 - Unlock	N/A

Table continues on the next page...

Table 5-8. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
				1 - Read Protect + Write Protect + Override Protect and Program protect lock	
0x400[9:8]]	MAC_ADDR_LOCK	2	Lock MAC_ADDR fuses.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[11:10]	GP1_LOCK	2	Lock for General Purpose fuse register #1 (GP1)	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[13:12]	GP2_LOCK	2	Lock for General Purpose fuse register #2 (GP2)	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	N/A
0x400[14]	SRK_LOCK	1	Locking SRK_HASH[255:0]	0 - Unlock 1 - Write Protect + Override Protect	N/A
0x400[19:18]	ANALOG_LOCK	2	Lock bit for various fuses (Addresses: 0x4D0-0x4F0)	00 - Unlock (The controlled field can be read, sensed,	N/A

Table continues on the next page...

Table 5-8. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
				burned or overridden in the corresponded. 1x - Override Protect (OP) x1 - Write Protect (WP) 11 - Both OP and WP	
0x400[22]	MISC_CONF_LOCK	1	Locking of MISC_CONFIG fuses (address 0x6D0)	0 - Unlock 1 - WP + OP of MISC_CONF	N/A
0x410[31:0]	SJC_CHALL[31:0] / UNIQUE_ID[31:0]	32	Device Unique ID, also be used for SJC Challenge phrase. (bits 31-0)	Random, by test program.	TESTER_LOCK
0x420[31:0]	SJC_CHALL/ UNIQUE_ID[42:32]	32	Device Unique ID, also be used for SJC Challenge phrase. (bits 63-32)	Random, by test program.	TESTER_LOCK
0x430[21:20]	NUM_CORES	2	Indicates the type of device: single or dual cores.	00 - Dual Cores. 01 - Single core 10 - Reserved 11 - Reserved	TESTER_LOCK
0x430[24]	Reserved	1	Reserved	Reserved	TESTER_LOCK
0x440[17:16]	SoC core speed	2	SPEED_GRADING[1:0]	00 - 800MHz (Industrial grade) 01 - 852MHz (Automotive grade) 10 - 1000 MHz 11 - 1200 MHZ	TESTER_LOCK
0x450[7:0]	BOOT_CFG1	8	BOOT configuration register #1, Usage varies, depending on selected boot device.	See Table 5-1 for details.	BOOT_CFG_LOCK
0x450[15:8]	BOOT_CFG2	8	BOOT configuration register #2, Usage varies, depending on selected boot device.	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK

Table continues on the next page...

Table 5-8. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Settings	Locked by
0x450[23:16]	BOOT_CFG3	8	BOOT configuration register #3	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK
0x450[31:24]	BOOT_CFG4	8	BOOT configuration register #4	Refer to the respective boot fusemap tables for details.	BOOT_CFG_LOCK
0x460[0]	SDP_DISABLE	1	Enable/disable serial download support This fuse is available only on silicon revision 1.4 or later	0 – Serial download supported (default) 1 – No serial download support. Recommended for security-enabled applications.	BOOT_CFG_LOCK
0x460[1]	SEC_CONFIG[1]	1	Select polarity of GPIO pin used for LPB indication.	Out of FAB state: 0 - Open - allows any code to be flashed and executed, even if it has no valid signature. 1 - Closed (Security On)	BOOT_CFG_LOCK
0x460[2]	SDP_READ_DISABLE	1	Enable/disable reads using serial download support This fuse is available only on silicon revision 1.4 or later	0 – Reads and writes allowed using serial download (default) 1 – Reads using SDR READ_REGISTER are disabled. Writes using SDP are still possible.	BOOT_CFG_LOCK
0x460[3]	DIR_BT_DIS	1	Direct External Memory Boot Disable	0 - The reserved NXP modes are enabled 1 - The reserved NXP modes are disabled. This fuse must be blown to 1 for normal operation.	BOOT_CFG_LOCK

Chapter 6
External Memory Controllers

6.1 Overview

This chip has these external memory interfaces and controllers:

- Multi-Mode DDR Controller (MMDC)
- Raw NAND flash controller, consisting of GPMI2, BCH40 and APBH_DMA components including the Randomizer module.
- EIM-PSRAM/NOR flash controller

6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that supports several types of DDR memories and two channel memory widths (x32 and x64).

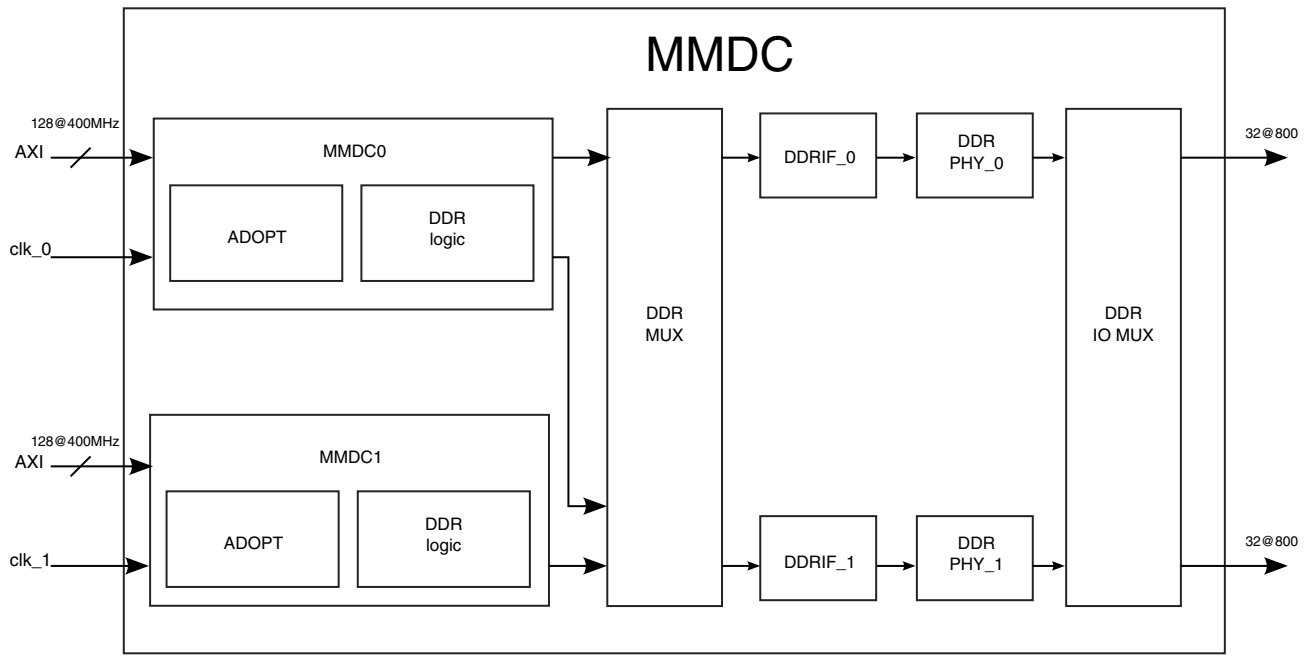

Figure 6-1. MMDC block diagram

Table 6-1. MMDC feature summary

Feature	Description
Supported standards	• LV-DDR3, DDR3 x16, x32, x64 (includes SODIMM) • LPDDR2 2ch x32, in either the split map or the interleaving mode • LPDDR2 1ch x32

DDR interface	• x16, x32, x64 data bus width
	• Density of 256 MB-4 GB
	  • Column size of 8-12 bits
	  • Row size of 11-16 bits
	• 2 CS per channel, with a separate CS allocation for the LPDDR2-DRAM)
	• Up to 4 GB address space and configurable address space per CS. For LPDDR2 2ch x32 up to 2 GB per channel
	• Interleaved accesses of LPDDR2-DRAM towards the same DDR channel. This is supported only when using the same clock frequency for LPDDR2-DRAM
	• Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2

DDR performance	• DDR3 and LPDDR2 running at 400 MHz (800 MT/s) • Supports Real-Time priority by means of QoS the sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write requests queues to enable bank prediction • Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed)

Table continues on the next page...

Table 6-1. MMDC feature summary (continued)

Feature	Description
	• Can track open memory pages • Supports bank interleaving • Special optimization for non-aligned wrap accesses in burst length 8
AXI interface	• AXI bus compliant with glueless interface to PL301 AXI network interconnect • Supports bus transfers of 8,16, 32, 64, and 128 bits (single accesses and bursts)

DDR calibration and delay-lines	• All calibrations can be done automatically by hardware or manually by software.
	• ZQ calibration for an external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command).
	  • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh).
	  • Can be handled manually at ZQ INIT.

DDR general	• Configurable timing parameters • Configurable refresh scheme • Supports dynamic voltage, frequency change, and low-power mode entry through hardware negotiation with the system (req/ack handshake) • Suppors automatic self-refresh and power down entry and exit • Supports the fast and slow precharge power down in DDR3 • Supports various ODT control schemes. • Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS • Supports MRW and MRR commands for LPDDR2 • Software control for moving to derated timing parameters and derated refresh rate according to the temperature variation. • Supports various debug and profiling modes

6.3 Raw NAND flash controller overview

The Raw NAND flash controller consists of three components: BCH, GPMI, and APBH_DMA.

- BCH is a 40-bit error correction hardware engine with an AXI bus master and a private connection to the GPMI.
- GPMI is the NAND controller pin interface.
- APBH_DMA is the DMA engine that drives the GPMI module.

This figure shows the modules' connectivity:

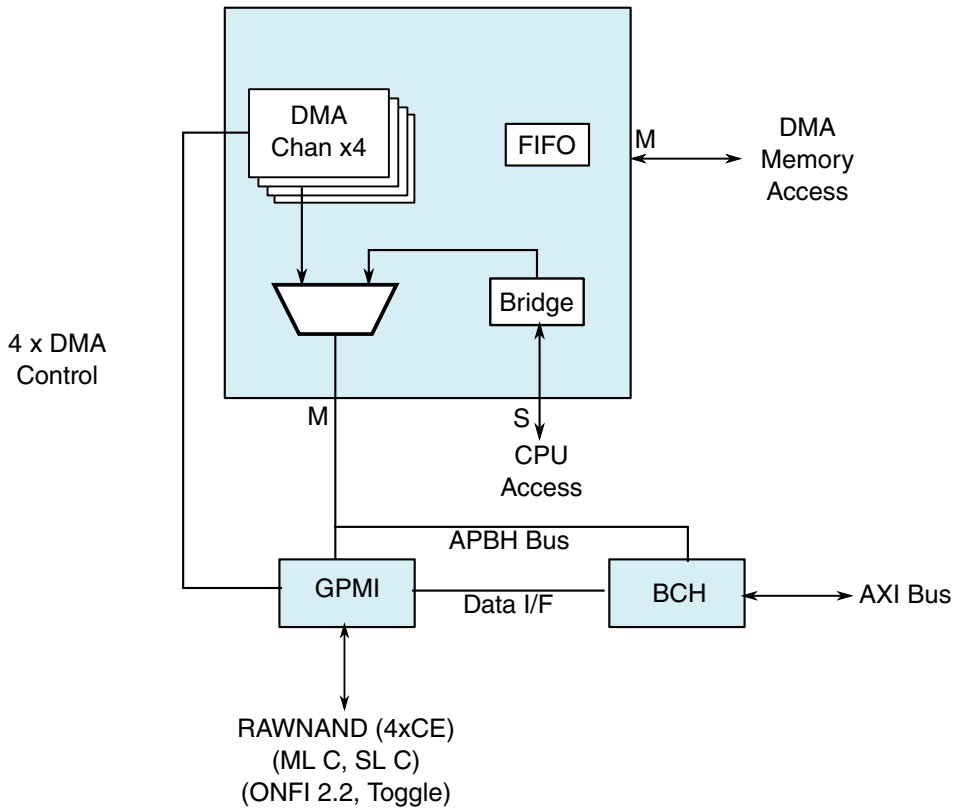

Figure 6-2. Raw NAND flash controller sub-system

6.3.1 NAND interface features

- ONFI2.2-compliant
  - Timing modes 0-5 for both the asynchronous and synchronous interfaces
  - Synchronous clock rate of up to 100 MHz with data rate of up to 200 MB/s
- Support for ganged ready/busy inputs
  - Support allows the use of a single package pin for all ready busy/busy input signals
  - In the ganged mode (selectable by the programmable mode bit), the GPMI expects that all NAND r/b pins are hardwired to the GPMI RDY_BUSY0
- Up to four NAND devices, supported by four chip-selects and one ganged ready/busy
- Legacy raw SLC, MLC type device
- BA-NAND (Micron)
- PBA-NAND and LBA-NAND (Toshiba)
- E2-NAND (Hynix)

- EF-NAND (Samsung)
- Samsung's "Toggle-mode" NAND (clock rate of up to 66 Mhz and 80 Mhz, with a data rate of up to 133 MB/s and 160 MB/s respectively)
- Configurable page size of 2 KB, 4 KB, or 8 KB
- Configurable spare area per page of up to 512 B
- Support for non-identical NAND devices is not required

6.3.2 NAND control features

The NAND control supports interleaved accesses to as many as four NAND devices while hiding the busy period of each device. However, a fully-independent interleaving can't be supported in the ganged ready/busy mode because that suggests a fully independent DMA channel operation on multiple paralleled-accessed chip-enables.

It also features:

- Delay line for adjusting the latching edge in case the frequency is relatively high while the delay is long
- Support for monitoring the external ready/busy signal and read status command polling to compare the R/B bit.

6.3.3 Internal interface features

- The AXI Master interface can access the system memory space.
- The APBH slave port for register configuration through the APBH bridge DMA

6.3.4 APBH-DMA overview

APBH-DMA provides the APB peripheral bus system for GPMI and BCH. APBH-DMA uses a single GPMI interface to support as many as four DMA channels for four NAND devices (four chip-enables) in the interleaved mode.

6.3.5 ECC-BCH features

BCH supports:

- Data rate of up to 200 MB/s
- 2 KB codeword (1 KB of data + parity)

    - Galois Field polynomial GF(2^14)
    - Up to 40-bit ECC for 1 KB of data (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)
- 1 KB codeword (1/2 KB of data + parity)
    - Galois Field polynomial GF(2^13)
    - Up to 40-bit ECC for 1/2 KB of data (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)

6.4 EIM-PSRAM/NOR flash controller overview

EIM is an external interface module that manages the interface to external chip devices, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

6.4.1 EIM features

- Up to four (software configurable) chip selects for external devices
    - Flexible address decoding; each chip-select memory space is determined separately according to the GPR bits in IOMUXC.
    - Maximum supported density is 128 MB by default (AUS bit is cleared). When the AUS bit is set, the maximum supported density is 32 MB.
- Selectable write protection for each chip select
- Support for multiplexed address/data bus operation (x16 and x32 port size)
- Programmable data port size for each chip select (x8, x16, and x32)
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Supports asynchronous page mode accesses (x16 and x32 port size)
- Supports a continuous burst clock that can be used as a reference clock for FPGA
- Independent synchronous memory burst read mode support for NOR-flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous memory burst write mode support for PSRAM and NOR-flash memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™from Toshiba)
- Supports NAND-flash devices with a NOR-flash interfaces - OneNAND™ (Samsung)

- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little-endian operation
- ARM AXI slave interface accesses are only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY_INT signal
  - RDY signal support assertion after reset
  - INT signal support assertion after reset for OneNAND™ (Samsung) device
  - Supports little-endian mode only

6.4.2 EIM boot scenarios

EIM allows booting from NOR-flash devices. To select the NOR flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See Sytem Boot for more information.

6.4.3 EIM boot configuration

This table shows the EIM boot configuration:

Table 6-2. EIM boot configuration

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DSZ[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2]	CS0RCR1
	WWSC[4:2]	CS0WCR
4	ERRST	WCR
3	RAL	CS0RCR1
	WAL	CS0WCR
2	MUM	CS0GCR1
	OEA[1]	CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

6.4.4 OneNAND requirements

By default, the Ready/Busy pin is not in use, perform these steps to configure the OneNAND:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the OneNAND device to any GPIO pin and use it as an interrupt that indicates the OneNAND device ready state.

Chapter 7
System Debug

7.1 Overview

This section describes the hardware and software debug and application development features and resources of the chip. It describes the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- Arm CoreSight architecture, adapted to i.MX 6Solo/6DualLite SoC (for 1x and 2x core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under the debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the Arm RealView Debugging tools and other third-party tools
- TPIU, a trace port interface unit that efficiently accesses the program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

7.2 Chip and Arm Platform Debug Architecture

The Arm Debug architecture is based on the CoreSight architecture by Arm. The CoreSight architecture provides a system-wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form the CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access the debug functionality without software interaction
- To connect to a running system without performing a reset

Full access to the processor debug capability is available by the Arm debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state, and restarts the processor core.

7.2.1 Debug Features

- CoreSight Program Trace Macrocell (PTM): trace generator for the Arm Cortex-A9 core
- Support for a TrustZone-related 3-level debug scheme:
  - Debug in Non-Secure privileged and user, and Secure user
  - Debug in Non-Secure only
- EmbeddedICE-RT logic
  - Support for both the monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core-mapped and memory-mapped resource examination/modification
- Data communication channel between the Arm core and the host debugger via JTAG and the Debug Access Port (DAP) module
- PMU (Performance Metrics Unit) used for system profiling and debug
- CP15 register for debugging the MMU, I and D L1 cache, and TLB
- PL310 L2 cache provides an event monitoring signal routed to pins for visibility to help in system debug

The chip includes Arm CoreSight components for multicore debug and trace solutions.

See the following figure for the Arm debug architecture scheme.

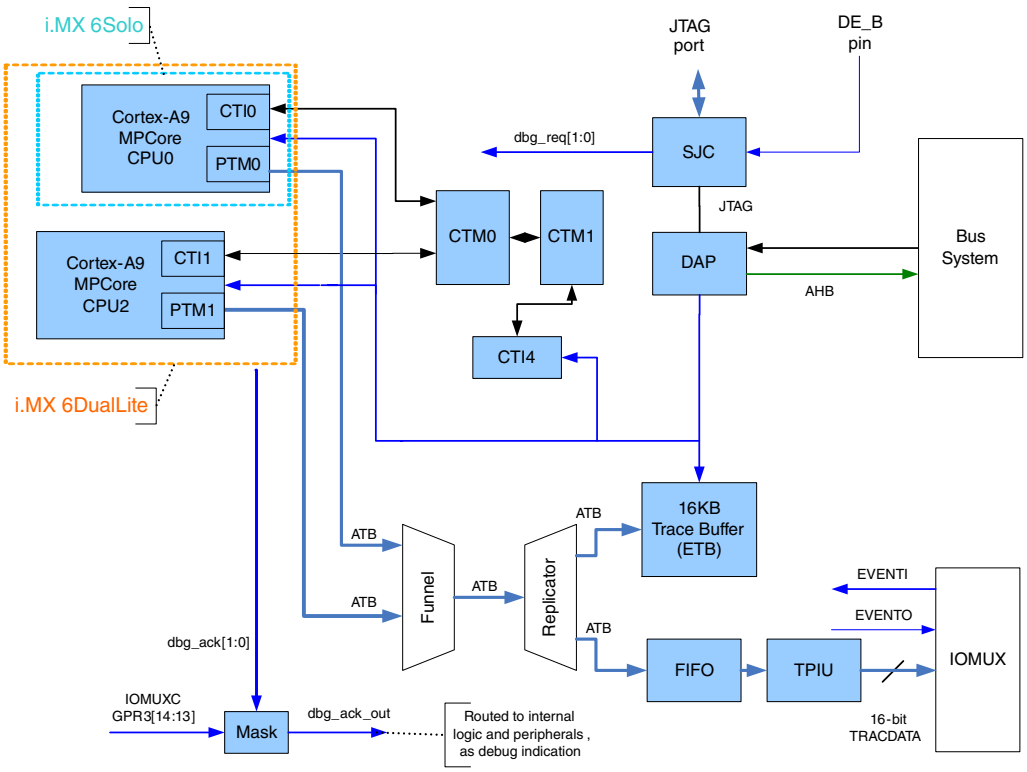

Figure 7-1. i.MX 6Solo/6DualLite Cortex-A9 platform debug architecture

7.2.2 Debug system components

The CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM
- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility which selects critical signals routed to the I/O pads as alternate outputs for external visibility

7.2.2.1 AMBA Trace Bus (ATB)

ATB transfers trace data though the chip CoreSight infrastructure. The trace sources are ATB masters and the sinks are ATB slaves. The Arm (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both the master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine the sources into a single trace stream
- Association of the trace data with the generating source using trace source IDs. The CoreSight system can trace up to 111 different items at any time
- Capture and transfer of multiple byte bus widths, currently to 32 bits
- A flushing mechanism to force the historic trace to drain from any sources, links, or sinks up to the point that the request is initiated

7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—the ATB replicator accepts the trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—the ATB replicator sends identical trace data on the outgoing master port interfaces.

7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from Arm Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate the debug state information from one core to another, so that the program execution can be stopped on both processors at the same time (if required).

The ECT consists of these types of modules:

- Cross Trigger Interfaces (CTI)
- Cross Trigger Matrix (CTM)

The cross trigger interfaces provide the interface between the component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event, it maps it onto a trigger output. This enables the subsystems to cross trigger with each other. The reception and transmission of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger requests generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides the Channel Interfaces (CIs) to connect to either the CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/ five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a software-controlled debug signal matrix that receives signals from various sources (cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. These debug resources include the time-stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

NOTE

Because the ECT should only be used during the debug sessions, it is disabled by default.

The chip's cross-triggering architecture consists of 2xCTMs and 2 / 3[1] CTIs cover these three basic groups of functionality:

- CTI 0,1 - for Arm core 0/1 respectively

1. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross-Trigger Matrix) is provided by Arm. A brief description is provided below. See the Arm documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in i.MX6Solo/6DualLite in the Arm platform.

One of them is used to route 2x Core's CTI's, while the second one is used for the additional CoreSight CTIs. Each CTI has four channel lines, to which the CTI events are mapped. The exact mapping is configured in the CTI logic.

7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by Arm. A brief description of the CTI is provided below.

There are 3 CTIs in the chip's Arm platform. Two are of which, dedicated to each Core, while the 3rd is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see Arm platform chapter.

7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access though AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
  - AHB Access Port (AHB-AP)
  - APB Access Port (APB-AP)
  - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

7.2.2.5 Coresight Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit RAM. The ETB accepts trace data from any CoreSight-compliant component trace source with an ATB master port, such as a trace source or a trace funnel. It is included in this device to remove dependencies from the trace pin pad speed, and enable low cost trace solutions. The TraceRAM size is 2 KB.

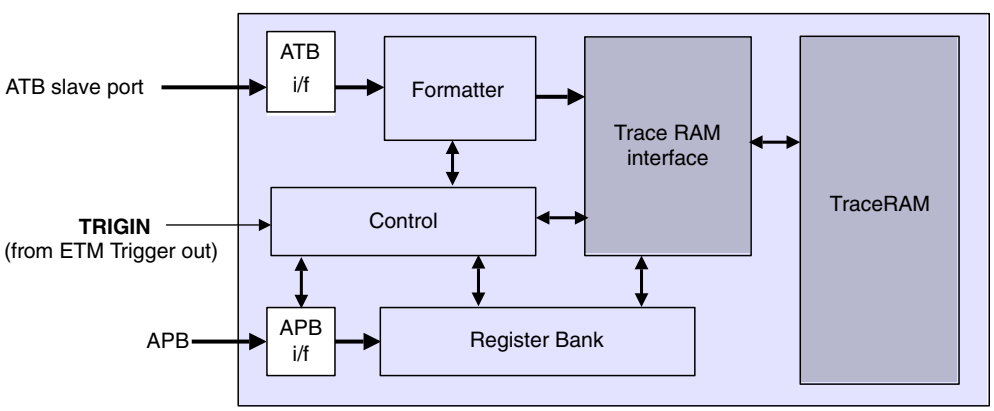

Figure 7-2. ETB Block Diagram

The ETB contains the following blocks:

- Formatter—Inserts source ID signals into the data packet stream so that trace data can be re-associated with its trace source after the data is read back out of the ETB.
- Control—Control registers for trace capture and flushing.

- APB interface—Read, write, and data pointers provide access to ETB registers. In addition, the APB interface supports wait states through the use of a PREADYDBG signal output by the ETB. The APB interface is synchronous to the ATB domain.
- Register bank—Contains the management, control, and status registers for triggers, flushing behavior, and external control.
- Trace RAM interface—Controls reads and writes to the Trace RAM.

7.2.2.5.1 Performance Profiling with the ETB

To create a performance profile (for example, gprof) for the target application, a means to collect trace over a long period of time is needed. The ETB buffer is too small to capture a meaningful profile in just one take. What is needed is to collect and concatenate data from the ETB buffer for multiple sequential runs. Using the ETB packet counter, the trace analysis tool can capture multiple sequential runs by executing code until the ETB is almost full, and halting or executing an interrupt handler to allow the buffer to be emptied, and then continuing executing code. The target halts or executes an interrupt handler when the buffer is almost full to empty the data and then the debugger runs the target again.

7.2.2.5.2 ETB Counter Control

The ETB packet counter is controlled by the ETB counter control register, ETB reload register, and ETB counter value register implemented in the Miscellaneous Control Module (MCM) accessible via the Private Peripheral Bus. Via the ETB counter control register the ETB control logic can be configured to cause an MCM Alert Interrupt, an NMI Interrupt, or cause a Debug halt when the down counter reaches 0. Other features of the ETB control logic include:

- Down counter to count as many as 512 x 32-bit packets.
- Reload request transfers reload value to counter.
- ATB valid and ready signals used to form counter decrement.
- The counter disarms itself when the count reaches 0.

The counter decrement enable will allow the counter to decrement at the rising edge of ATCLK when,

- The counter enable bit is set.
- The counter is armed.
- ATVALID and ATREADY are asserted.

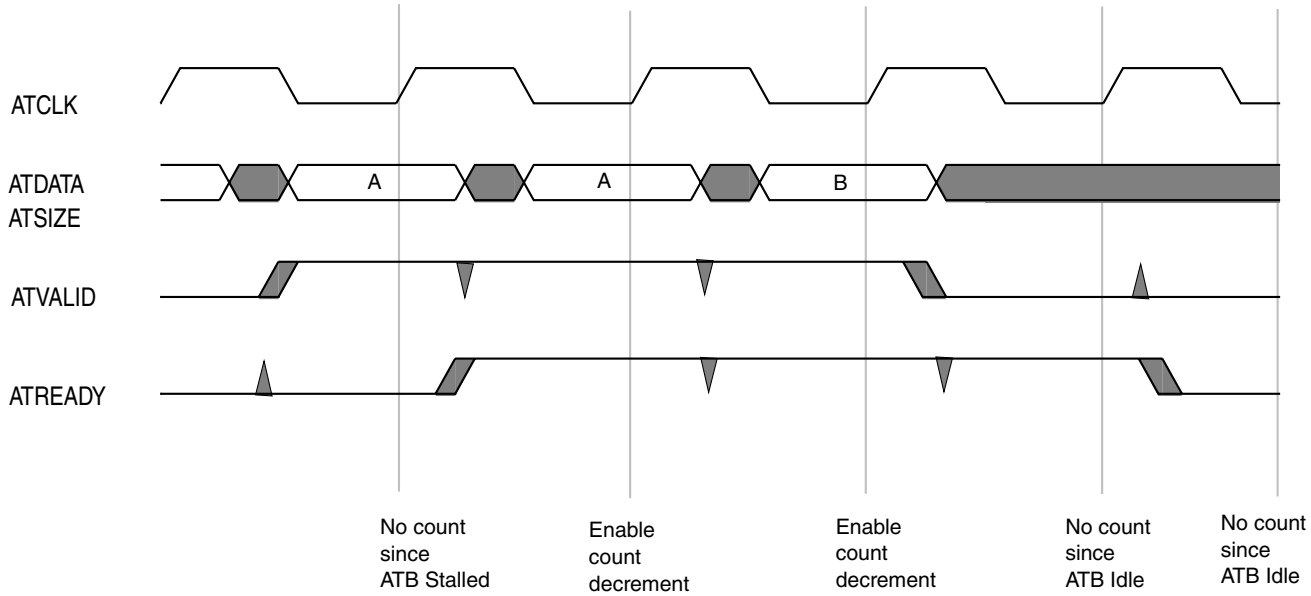

Figure 7-3. Count Decrement Enable

7.2.3 Chip-Specific SJC Features

7.2.3.1 JTAG Disable Mode

In addition to four different JTAG security modes that are implemented internally in the JTAG Controller, there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

7.2.3.2 JTAG ID

Table 7-1. i.MX JTAG ID

Device	Silicon revision	JTAG ID
i.MX 6Solo	Rev 1.0	0891_B01Dh[1]
i.MX 6DualLite	Rev 1.0	0891_A01Dh[2]

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891_B01Dh for Rev 1.1, 2891_B01Dh for Rev 1.2 , etc.
2. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891_A01Dh for Rev 1.1, 2891_A01Dh for Rev 1.2 , etc.

7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the Arm Debug Access Port (DAP).

The DAP itself has a JTAG serial links, which can drive the PCIe PHY JTAG logic, used for testing of the PHYs.

NOTE

Single Wire Debug (SWD) protocol is not supported.

7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; puting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- Four levels of security, ranging from no security to no JTAG accessibility to the chip

7.2.6 TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

NOTE

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
  - SDMA core control - run/halt/single-step
  - SDMA core register/memory-map access

    - Event detection, watchpoints, and hardware breakpoints
    - Real time buffer and PC trace buffer capability
- Trace buffer
    - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
    - Includes information about all the channel dump activity
    - Current contents of SDMA RAM
- ROMPATCH

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd

instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module
  - SJC-controlled Debug Request
  - SJC-readable Debug Acknowledge (in debug mode)
  - Debug clock control - allows SJC to force clocks on for debug purposes
  - Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE_AFTER_RESET mode. A debug request also puts the SDMA in its DEBUG_IN_IDLE_AFTER_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the exec_core <instruction> SDMA OnCE instruction to return to the IDLE_AFTER_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

7.4 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn

debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

7.5 Supported tools

DS-5 Arm Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

Chapter 8
System Boot

8.1 Overview

The boot process begins at the Power-On Reset (POR) where the hardware reset logic forces the Arm core to begin the execution starting from the on-chip boot ROM.

The boot ROM code uses the state of the internal register BOOT_MODE[1:0] as well as the state of various eFUSEs and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device Configuration Data (DCD) and plugin
- Digital signature and encryption based High-Assurance Boot (HAB)
- Wake-up from the low-power modes
- Wake-up secondary core

The boot ROM supports these boot devices:

- NOR flash
- NAND flash
- OneNAND flash
- SD/MMC
- Serial (I2C/SPI) NOR flash and EEPROM

The boot ROM uses the state of the BOOT_MODE and eFUSEs to determine the boot device. For development purposes, the eFUSEs used to determine the boot device may be overridden using the GPIO pin inputs.

The boot ROM code also allows to download the programs to be run on the device. The example is a provisioning program that can make further use of the serial connection to provide a boot device with a new image. Typically, the provisioning program is

downloaded to the internal RAM and allows to program the boot devices, such as the SD/MMC flash. The ROM serial downloader uses a high-speed USB in a non-stream mode connection.

The boot ROM allows waking up from the low-power modes and waking up the secondary core of Cortex-A9. On reset, the ROM checks the Arm core ID and the power gating status register. When waking from the low-power mode, the primary core (ID=0) skips loading an image from the boot device and jumps to the address saved in PERSISTENT_ENTRY0. The secondary cores (ID!=0) jump to the address in PERSISTENT_ENTRY<X> where 0<X<4 in all power modes.

The Device Configuration Data (DCD) feature allows the boot ROM code to obtain the SOC configuration data from an external program image residing on the boot device. As an example, the DCD can be used to program the DDR controller for optimal settings, improving the boot performance. The DCD is restricted to the memory areas and peripheral addresses that are considered essential for the boot purposes (see Write data command).

A key feature of the boot ROM is the ability to perform a secure boot, also known as a High-Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. The HAB uses a combination of hardware and software together with the Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows the user image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as a part of the final program image. If configured to do so, the ROM verifies the signatures using the public keys included in the program image. In addition to supporting the digital signature verification to authenticate the program images, the encrypted boot is also supported. The encrypted boot can be used to prevent the cloning of the program image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the serial downloader. The HAB library in the boot ROM also provides the API functions, allowing the additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for the SEC_CONFIG is the open configuration, in which the ROM/HAB performs the image authentication, but all authentication errors are ignored and the image is still allowed to execute.

NOTE

Silicon Revision 1.6 and later supports additional fuses related to Serial Download mode. Fuse SDP_DISABLE enables/disables Serial Download mode support. Fuse SDP_READ_ENABLE enables/disables reads using Serial Download mode. For detailed information on these fuses, see Fusemap.

8.2 Boot modes

During reset, the chip checks the ARM core ID and power gating controller status register.

During boot, the core's behavior is defined by the boot mode pin settings, as described in Boot mode pin settings. When waking up from the low-power boot mode, the core skips the clock settings. The boot ROM checks that the PERSISTENT_ENTRY0 (see Persistent bits) is a pointer to a valid address space (OCRAM, DDR, or EIM). If the PERSISTENT_ENTRY0 is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT_ENTRY0 register. If the PERSISTENT_ENTRY0 is a pointer to an invalid range, the core performs the system reset.

For the secondary cores (with ID!=0), the boot ROM checks that the PERSISTENT_ENTRY is a pointer to a valid address space (OCRAM, DDR, or EIM). If the PERSISTENT_ENTRY is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT_ENTRY register. If the PERSISTENT_ENTRY is a pointer to an invalid range, it sets the error status registers (see Persistent bits), sends the wake-up error interrupt, and performs the Wait For Interrupt instruction. The interrupt service routine of the other core must reconfigure the system and reset the secondary core that failed to boot.

NOTE

The code that enables the secondary cores is not a part of the ROM, but it must be a part of the upper-level software.

8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for NXP use). The boot mode is selected based on the binary value stored in the internal BOOT_MODE register.

The BOOT_MODE is initialized by sampling the BOOT_MODE0 and BOOT_MODE1 inputs on the rising edge of the POR_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT_MODE internal register. The state of the

internal BOOT_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See this table for settings:

Table 8-1. Boot MODE pin settings

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

NOTE

Silicon Revision 1.6 and later, the FORCE_INTERNAL_BOOT has been implemented. This fuse causes the BOOT_MODE inputs to be ignored and the boot ROM will force the boot mode to “Internal Boot”. This prevents impact from physically tampering with the BOOT_MODE pins and is recommended for security-enabled application. For detailed information on this fuses, see Fusemap.

8.2.2 High-level boot sequence

The figure found here show the high-level boot ROM code flow.

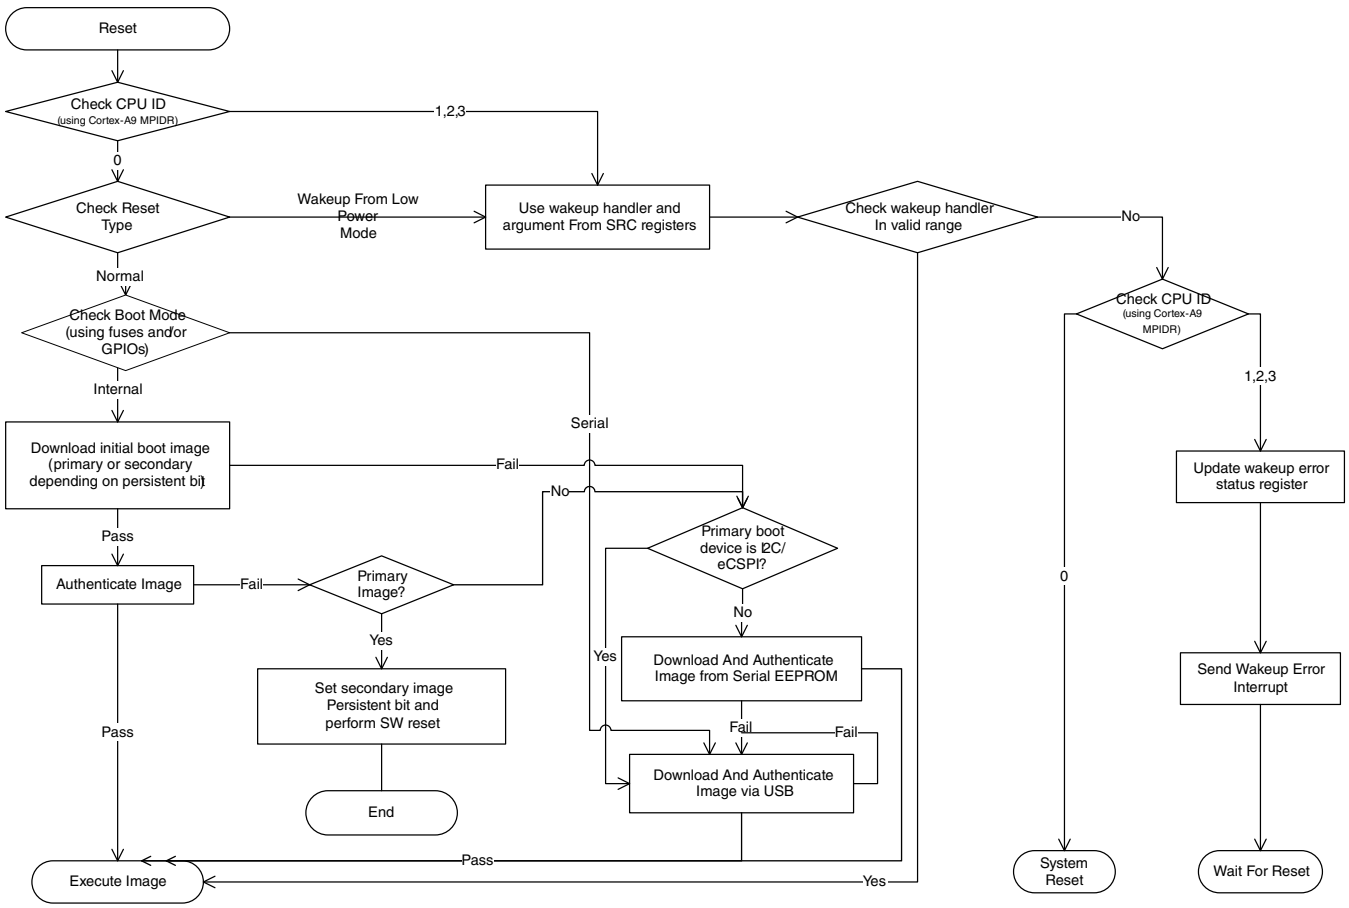

Figure 8-1. Boot flow

8.2.3 Boot From Fuses mode (BOOT_MODE[1:0] = 00b)

A value of 00b in the BOOT_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in Internal Boot mode (BOOT_MODE[1:0] = 0b10) with one difference. In this mode, the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT_FUSE_SEL eFUSE value. If BT_FUSE_SEL = 0, indicating that the boot device (for example, flash, SD/MMC) was not programmed yet, the boot flow jumps directly to the Serial Downloader. If BT_FUSE_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSEs may be configured incorrectly for the hardware on the platform. In such case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using the Boot From Fuses mode addresses this problem.

Setting the BT_FUSE_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a program image and blow the BT_FUSE_SEL and the other boot configuration eFUSEs. After the reset, the boot ROM code determines that the BT_FUSE_SEL is blown (BT_FUSE_SEL = 1) and the ROM code performs an internal boot according to the new eFUSE settings. This allows the user to set BOOT_MODE[1:0]=00b on a production device and burn the fuses on the same device (by forcing the entry to the Serial Downloader), without changing the value of the BOOT_MODE[1:0] or the pullups/pulldowns on the BOOT_MODE pins.

8.2.4 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB serial connection.

In this mode, the ROM programs the WDOG1 for a 90-second time-out if the WDOG_ENABLE eFuse is 1 and continuously polls for the USB connection. If no activity is found on the USB OTG1 and the watchdog timer expires, the Arm core is reset.

NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB boot flow:

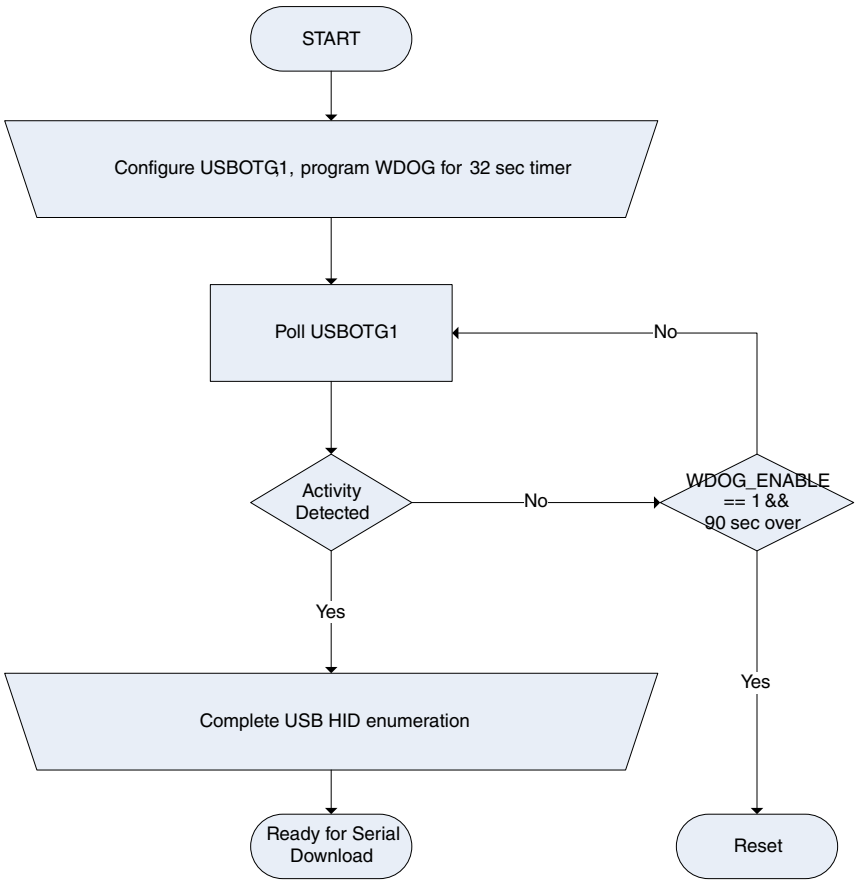

Figure 8-2. Serial Downloader boot flow

8.2.5 Internal Boot mode (BOOT_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT_MODE[1:0] register selects the Internal Boot mode. In this mode, the processor continues to execute the boot code from the internal boot ROM.

The boot code performs the hardware initialization, loads the program image from the chosen boot device, performs the image validation using the HAB library (see Boot security settings), and then jumps to an address derived from the program image. If an error occurs during the internal boot, the boot code jumps to the Serial Downloader (see Serial Downloader). A secure boot using the HAB is possible in all the three boot modes.

When set to the Internal Boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using the General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT_FUSE_SEL) determines whether the ROM uses the GPIO pins for a selected number of configuration parameters or eFUSEs in this mode.

- If BT_FUSE_SEL = 1, all boot options are controlled by the eFUSEs described in Table 8-2.
- If BT_FUSE_SEL = 0, the specific boot configuration parameters may be set using the GPIO pins rather than eFUSEs. The fuses that can be overridden when in this mode are indicated in the GPIO column of Table 8-2. Table 8-3 provides the details of the GPIO pins.

The use of the GPIO overrides is intended for development since these pads are used for other purposes in the deployed products. NXP recommends controlling the boot configuration by the eFUSEs in the deployed products and reserving the use of the GPIO mode for the development and testing purposes only.

8.2.6 Boot security settings

The internal boot modes use one of three security configurations.

- Closed: This level is intended for use with shipping-secure products. All HAB functions are executed and the security hardware is initialized (the Security Controller or SNVS enters the Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, and the boot flow is aborted with the control being passed to the serial downloader. At this level, the execution does not leave the internal ROM unless the target executable image is authenticated.
- Open: This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. The security hardware is initialized (except for the SNVS which is left in the Non-Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, but have no influence on the boot flow which continues as if the errors did not occur. This configuration is useful for a secure product development because the program image runs even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of the authentication failure.
- Field Return: This level is intended for the parts returned from the shipped products.

8.3 Device configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes the boot device selection (SPI, EIM, NOR, SD, MMC, and so on), boot device configuration (SD bus width, speed, and so on), and other. In general, the source for this configuration comes from the eFUSEs embedded inside the chip. However, certain configuration parameters can be sourced from the GPIO pins, allowing further flexibility during the development process.

8.3.1 Boot eFUSE descriptions

This table is a comprehensive list of the configuration parameters that the ROM uses.

Table 8-2. Boot eFUSE descriptions

Fuse	Configuration	Definition	GPIO[1]	Shipped value	Settings[2]
DIR_BT_DIS	OEM	Disables the NXP reserved modes.	NA	0	0—The reserved NXP modes are enabled. 1—The reserved NXP modes are disabled. This fuse must be blown to 1 for normal operation.
BT_FUSE_SEL	OEM	In the Internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by the GPIO pins or the eFUSE settings in the On-Chip OTP Controller (OCOTP). In the Boot From Fuse mode BOOT_MODE[1:0] = 00, the BT_FUSE_SEL fuse indicates whether the bit configuration eFuses are programmed.	NA	0	If BOOT_MODE[1:0] = 0b10: • 0—The bits of the SBMR are overridden by the GPIO pins. • 1—The specific bits of the SBMR are controlled by the eFUSE settings. If BOOT_MODE[1:0] = 0b00 • 0—The BOOT configuration eFuses are not programmed yet. The boot flow jumps to the serial downloader. • 1—The BOOT configuration eFuses are programmed. The regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_CONFIG[0] - NXP SEC_CONFIG[1] - OEM	Security Configuration, as defined in Boot security settings	NA	01	00—Reserved 01—Open (allows any program image, even if the authentication fails) 1x—Closed (The program image executes only if authenticated)
FIELD_RETURN	OEM	Enables the NXP reserved modes.			0—The NXP reserved modes are enabled/ disabled based on the DIR_BT_DIS value. 1—The NXP reserved modes are enabled.
SRK_HASH[255:0]	OEM	256-bit hash value of the super root key (SRK_HASH)	NA	0	Settings vary—used by HAB

Table continues on the next page...

Table 8-2. Boot eFUSE descriptions (continued)

Fuse	Configuration	Definition	GPIO[1]	Shipped value	Settings[2]
UNIQUE_ID[63:0]	NXP	Device Unique ID, 64-bit UID	NA	Unique ID	Settings vary—used by HAB
BT_MMU_DISABLE (BOOT_CFG3[6])	OEM	The MMU/L1 D Cache/ PL310 disable bit used by the boot ROM for fast HAB processing.	Yes	0	0—MMU/L1 D Cache/PL310 is enabled by the ROM during the boot. 1—MMU/L1 D Cache/PL310 is disabled by the ROM during the boot.
L1 I-Cache DISABLE (BOOT_CFG3[7])	OEM	L1 I Cache disable bit used by the boot during the entire execution.	Yes	0	0—L1 I Cache is enabled by the ROM during the boot. 1—L1 I Cache is disabled by the ROM during the boot.
BT_FREQ (BOOT_CFG3[2])	OEM	Boot frequency selection	Yes	0	0—Arm—792 MHz, DDR—396 MHz, AXI—264 MHz 1—Arm—396 MHz, DDR—352 MHz, AXI—176 MHz
BOOT_CFG1[7:0]	OEM	Boot configuration 1	Yes	0	Specific to the selected boot mode
BOOT_CFG2[7:0]	OEM	Boot configuration 2	Yes	0	Specific to the selected boot mode
BOOT_CFG4[6:0]	OEM	Boot configuration 4		0	Specific to the selected boot mode
BOOT_CFG4[7]	OEM	Infinite Loop Enable at the start of the boot ROM. Used for debugging purposes. Ignored if the DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0—Disabled 1—Enabled
LPB_BOOT	OEM	USB Low-Power Boot	No	0	00—LPB Disable 01—1 GPIO (default frequencies) 10—Divide by 2 11—Divide by 4
BT_LPB_POLARITY	OEM	USB Low-Power Boot GPIO polarity	No	0	0—Low on the GPIO pad indicates the low-power condition. 1—High on the GPIO pad indicates the low-power condition.
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0—The watchdog reset counter is disabled during the serial downloader. 1—The watchdog reset counter is enabled during the serial downloader.
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable the SDMMC manufacture mode	Yes	0	0—enable the SD/MMC MFG mode 1—disable the SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for the SD/MMC and NAND boot modes	No	0	Override these IO PAD settings: • PAD_SETTINGS[0]—Slew Rate

Table 8-2. Boot eFUSE descriptions

Fuse	Configuration	Definition	GPIO[1]	Shipped value	Settings[2]
					• PAD_SETTINGS[3:1]—Drive Strength • PAD_SETTINGS[5:4]—Speed Settings .

1. This setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for the corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse

8.3.2 GPIO boot overrides

This table provides a list of the GPIO boot overrides:

Table 8-3. GPIO override contact assignments

Package pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot mode selection
BOOT_MODE0	Input	
EIM_DA0	Input	BOOT_CFG1[0]
EIM_DA1	Input	BOOT_CFG1[1]
EIM_DA2	Input	BOOT_CFG1[2]
EIM_DA3	Input	BOOT_CFG1[3]
EIM_DA4	Input	BOOT_CFG1[4]
EIM_DA5	Input	BOOT_CFG1[5]
EIM_DA6	Input	BOOT_CFG1[6]
EIM_DA7	Input	BOOT_CFG1[7]
EIM_DA8	Input	BOOT_CFG2[0]
EIM_DA9	Input	BOOT_CFG2[1]
EIM_DA10	Input	BOOT_CFG2[2]
EIM_DA11	Input	BOOT_CFG2[3]
EIM_DA12	Input	BOOT_CFG2[4]
EIM_DA13	Input	BOOT_CFG2[5]
EIM_DA14	Input	BOOT_CFG2[6]
EIM_DA15	Input	BOOT_CFG2[7]
EIM_A16	Input	BOOT_CFG3[0]
EIM_A17	Input	BOOT_CFG3[1]
EIM_A18	Input	BOOT_CFG3[2]

Table continues on the next page...

Table 8-3. GPIO override contact assignments (continued)

Package pin	Direction on reset	eFuse
EIM_A19	Input	BOOT_CFG3[3]
EIM_A20	Input	BOOT_CFG3[4]
EIM_A21	Input	BOOT_CFG3[5]
EIM_A22	Input	BOOT_CFG3[6]
EIM_A23	Input	BOOT_CFG3[7]
EIM_A24	Input	BOOT_CFG4[0]
EIM_WAIT	Input	BOOT_CFG4[1]
EIM_LBA	Input	BOOT_CFG4[2]
EIM_EB0	Input	BOOT_CFG4[3]
EIM_EB1	Input	BOOT_CFG4[4]
EIM_RW	Input	BOOT_CFG4[5]
EIM_EB2	Input	BOOT_CFG4[6]
EIM_EB3	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override the corresponding eFUSE values, depending on the setting of the BT_FUSE_SEL fuse.

8.3.3 Device Configuration Data (DCD)

The DCD is the configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various on-chip peripherals. See Device Configuration Data (DCD) for more details on DCD.

8.4 Device initialization

This section describes the details of the ROM and provides the initialization details.

This includes details on:

- The ROM memory map
- The RAM memory map
- On-chip blocks that the ROM must use or change the POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

8.4.1 Internal ROM/RAM memory map

These figures show the iROM memory map:

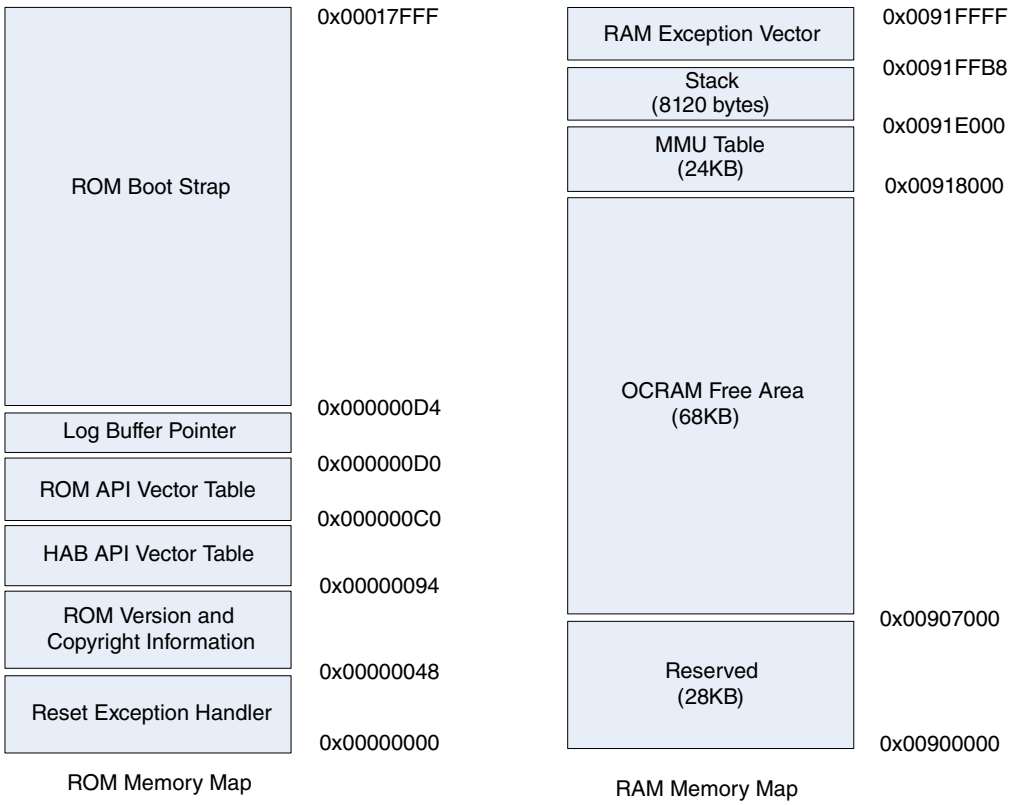

Figure 8-3. Internal ROM and RAM memory map

NOTE

If no ROM/HAB APIs are being used, the entire OCRAM region can be used freely after the boot.

8.4.2 Boot block activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in an alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and the boot device selection:

- APBH—the DMA engine to drive the GPMI module

- BCH—40-bit error correction hardware engine with the AXI bus master and a private connection to the GPMI
- CCM—Clock Control Module
- ECSPI—Enhanced Configurable Serial Peripheral Interface
- EIM—External Interface Module used for the NOR and OneNAND devices
- I2C—I^2C controller
- GPMI—NAND controller pin interface
- OCOTP_CTRL—On-Chip OTP Controller; the OCOTP contains the eFUSEs
- IOMUXC—I/O Multiplexer Control which allows the GPIO use to override the eFUSE boot settings;
- IOMUXC GPR—I/O Multiplexer Control General-Purpose Registers
- CAAM—Cryptographic Acceleration and Assurance Module
- SNVS—Secure Non-Volatile Storage
- SRC—System Reset Controller
- USB—used for the serial download of a boot device provisioning program
- USDHC—Ultra-Secure Digital Host Controller
- WDOG-1—Watchdog timer
- DTCP—Digital Transmission Content Protection
- HDCP—High-bandwidth Digital Content Protection

8.4.3 Clocks at boot time

The table below show the various clocks and their sources used by the ROM.

Table 8-4. Normal frequency clocks configuration

Clock	CCM signal	Source	Frequency (MHz) BT_FREQ=0	Frequency (MHz) BT_FREQ=1
System PLL	pll1_sw_clk		792	792
528 MHz PLL	pll2_sw_clk		528	528
480 MHz PLL	pll3_sw_clk		480	480
Arm core clock	arm_clk_root	System PLL	792	396
EIM	aclk_eim_slow_clk_root	AXI	132	132
AHB	ahb_clk_root	528 MHz PLL/PFD307	132	76.6
IPG	ipg_clk_root	528 MHz PLL/PFD307	66	38.3
AXI_A	axi_a	528 MHz PLL/PFD307	396	306
AXI_B	axi_b	528 MHz PLL/PFD352	264	153.3
USB	usboh3_clk_root	480 MHz PLL	60	60
USDHC	usdhc1_clk_root usdhc2_clk_root	PFD400	198	198

Table continues on the next page...

Table 8-4. Normal frequency clocks configuration (continued)

Clock	CCM signal	Source	Frequency (MHz) BT_FREQ=0	Frequency (MHz) BT_FREQ=1
	usdhc3_clk_root usdhc4_clk_root			
ECSPI	ecspi_clk_root	480 MHz PLL	60	60
I^2C	per_clk_root	528 MHz PLL	66	38.3

After the reset, each Arm core has access to all peripherals. The ROM code disables the clocks listed in the following table, except for the boot devices listed in the second column.

Table 8-5. List of disabled clocks

Clock name	Enabled for boot device
CCGR0_APBHDMA	
CCGR1_ECSPI1	ECSPI1
CCGR1_ECSPI2	ECSPI2
CCGR1_ECSPI3	ECSPI3
CCGR1_ECSPI4	ECSPI4
CCGR1_FEC	
CCGR1_EPIT1	
CCGR1_EPIT2	
CCGR2_I2C1_SERIAL	I2C1
CCGR2_I2C2_SERIAL	I2C2
CCGR2_I2C3_SERIAL	I2C3
CCGR3_OPENVGAXICLK	
CCGR4_PWM1	
CCGR4_PWM2	
CCGR4_PWM3	
CCGR4_PWM4	
CCGR5_SDMA	
CCGR5_SPDIF	
CCGR5_SSI1	
CCGR5_SSI2	
CCGR5_SSI3	
CCGR5_UART	
CCGR5_UART_SERIAL	
CCGR6_USBOH3	USB
CCGR6_USDHC1	USDHC1
CCGR6_USDHC2	USDHC2
CCGR6_USDHC3	USDHC3

Table continues on the next page...

Table 8-5. List of disabled clocks (continued)

Clock name	Enabled for boot device
CCGR6_USDHC4	USDHC4
CCGR6_EIM_SLOW	NOR, OneNAND

8.4.4 Enabling MMU and caches

The boot ROM includes a feature that enables the Memory Management Unit (MMU) and the caches to improve the boot speed.

The L1 instruction cache is enabled at the start of the image download. The L1 data cache, L2 cache, and MMU are enabled during the image authentication. When the HAB authentication completes, the ROM disables the L1 data cache, L2 cache, and MMU.

The L1 Instruction cache, L1 data cache, L2 cache, and MMU is controlled by eFuse. By default, these features are enabled.

Enabling the MMU when booting non-securely with SEC_CONFIG=Open and setting the CSF pointer in the Image Vector Table to NULL has no impact on the boot performance. With this configuration, it is recommended to blow the BT_MMU_DISABLE fuse.

8.4.5 Exception handling

The exception vectors located at the start of the ROM are used to map all the Arm exceptions (except the reset exception) to a duplicate exception vector table in the internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in the ROM.

During the boot phase of a secondary CPU, the internal RAM vectors point to a function that sets the error status registers (see Persistent bits), sends a wakeup error interrupt, and performs the Wait For Interrupt instruction. The interrupt service routine of the primary CPU must reconfigure the system and reset the secondary CPU.

After the boot, the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate exception vector table in the RAM.

Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR     PC, Reset_Addr
LDR     PC, Undefined_Addr
LDR     PC, SWI_Addr
LDR     PC, Prefetch_Addr
LDR     PC, Abort_Addr
NOP                         ; Reserved vector
LDR     PC, IRQ_Addr
LDR     PC, FIQ_Addr

;; Define exception vector table
Reset_Addr      DCD     start_address
Undefined_Addr  DCD     iRAM_Undefined_Handler
SWI_Addr        DCD     iRAM_SWI_Handler
Prefetch_Addr   DCD     iRAM_Prefetch_Handler
Abort_Addr      DCD     iRAM_Abort_Handler
                DCD     0               ; Reserved vector
IRQ_Addr        DCD     iRAM_IRQ_Handler
FIQ_Addr        DCD     iRAM_FIQ_Handler

start_address DCD start ;reset handler vector
```

8.4.6 Interrupt handling during boot

No special interrupt-handling routines are required during the boot process. The interrupts are disabled during the boot ROM execution and may be enabled in a later boot stage.

8.4.7 Persistent bits

Some modes of the boot ROM require the registers that keep their values after a warm reset. The SRC General-Purpose registers are used for this purpose.

See this table for persistent bits list and description:

Table 8-6. Persistent bits

Bit name	Bit location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used—primary and secondary. Used only for the boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as a warning. It identifies that there are errors in the NAND blocks that hold the application image. See NAND flash for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds the entry function for the CPU0 to wake up from the low-power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds the argument of entry function for the CPU0 to wake up from the low-power mode.

Table continues on the next page...

Table 8-6. Persistent bits (continued)

Bit name	Bit location	Description
PERSIST_OVERRIDE_SBMR1	SRC_GPR10[28]	This bit instructs the ROM code to use the SRC_GPR9 register as if it is the SBMR1. This allows the software to override the fuse bits and boot from an alternative boot source. This feature is vaild for a WDOG time-out reset only, and can be disabled if the DIR_BT_DIS fuse is blown.
PERSIST_SBMR1_VALUE	SRC_GPR9	The value to override the SBMR1.
PERSISTENT_ENTRY1[31:0]	SRC_GPR3[31:0]	Holds the entry function for the CPU1 to wake up from the low-power mode.
PERSISTENT_ARG1[31:0]	SRC_GPR4[31:0]	Holds the argument of the entry function for the CPU1 to wake up from the low-power mode.
CPU1_ERROR_STATUS	SRC_GPR10[25]	CPU1 error status bit

8.5 Boot devices (internal boot)

The chip supports these boot flash devices:

- NOR flash with the External Interface Module (EIM), located on CS0, 16-bit bus width.
- OneNAND flash with the EIM interface, located on CS0, 16-bits bus width.
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface. Page sizes of 2 KB, 4 KB, and 8 KB. The bus widths of 8-bit with 2 through 40-bit BCH hardware ECC (Error Correction) are supported.
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards.
- EEPROM boot via SPI (serial flash) and I^2C (via ECSPI and I^2C blocks respectively).

The selection of the external boot device type is controlled by the BOOT_CFG1[7:4] eFUSEs. See this table for more details:

Table 8-7. Boot device selection

BOOT_CFG1[7:4]	Boot device
0000	NOR/OneNAND (EIM)
0001	Reserved
0011	Serial ROM (I^2C/SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

8.5.1 NOR flash/OneNAND using EIM interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes, based on the fuse settings.

Table 8-8. EIM boot eFUSE descriptions

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0000	0000—boot from the EIM interface
BOOT_CFG1[3]	OEM	NOR/OneNAND selection	Yes	0	0—NOR 1—OneNAND
BOOT_CFG2[7:6]	OEM	Muxing scheme	Yes	00	00—muxed, 16-bit data (low half) interface 01—not muxed, 16-bit data (high half) interface 10—not muxed, 16-bit data (low half) interface 11—reserved
BOOT_CFG2[5:4]	OEM	OneNAND page size	Yes	00	00—1 KB 01—2 KB 10—4 KB 11—reserved

1. This setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for the corresponding GPIO pin.

8.5.1.1 NOR flash boot operation

Booting from the NOR flash is supported via the EIM interface. The ROM reads the Image Vector Table and Boot Data structures to determine if the image can be executed directly from the EIM address space or copied to another memory.

The start field of the Boot Data Structure specifies the final location of the image (see Image Vector Table and Boot Data).

8.5.1.2 OneNAND flash boot operation

At system power-up, the OneNAND device automatically copies the Initial Load Region of 1 KB from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

NOTE

The OneNAND boot RAM memory containing the Initial 1-KB Load Region must contain the IVT, DCD, and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the program image contents to the application destination pointer (located in the start entry of the Boot Data (see Image Vector Table and Boot Data). The ROM determines the size of the program image by the length specified by the size entry in the Boot Data structure (see Image Vector Table and Boot Data). A failure in loading data from the OneNAND device for any reason forces the chip to enter the Serial Downloader. Otherwise, the booting from the OneNAND device continues.

This figure illustrates the layout of the program image on the OneNAND boot device:

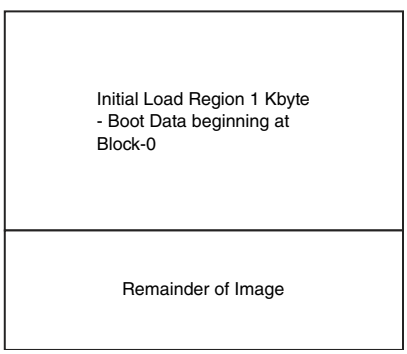

Figure 8-4. Program image layout on the OneNAND flash device

Before accessing the OneNAND device, the chip waits approximately 500 µs after the Power-On Reset. This delay is required for the OneNAND device to become ready. After this initial 500 µs delay, it can take additional 70 µs for the OneNAND device to load the Initial Load Region of 1 KB into its boot RAM. The chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 KB was loaded to the OneNAND boot RAM before continuing with the boot flow.

8.5.1.3 IOMUX configuration for EIM devices

The EIM interface uses the dedicated contacts on the IC.

The contacts assigned to the data signals used by the EIM are shown in this table:

Table 8-9. EIM IOMUX pin configuration

Signal	A/D16 (Muxed, 16-bit data low half interface)	A+DH (Not muxed, 16-bit data high half interface)	A+DL (Not muxed, 16-bit data low half interface)
DATA0	EIM_DA0.alt0	EIM_D16.alt0	CSI0_DATA_EN.alt1
DATA1	EIM_DA1.alt0	EIM_D17.alt0	CSI0_VSYNC.alt1
DATA2	EIM_DA2.alt0	EIM_D18.alt0	CSI0_DAT4.alt1
DATA3	EIM_DA3.alt0	EIM_D19.alt0	CSI0_DAT5.alt1
DATA4	EIM_DA4.alt0	EIM_D20.alt0	CSI0_DAT6.alt1
DATA5	EIM_DA5.alt0	EIM_D21.alt0	CSI0_DAT7.alt1
DATA6	EIM_DA6.alt0	EIM_D22.alt0	CSI0_DAT8.alt1
DATA7	EIM_DA7.alt0	EIM_D23.alt0	CSI0_DAT9.alt1
DATA8	EIM_DA8.alt0	EIM_D24.alt0	CSI0_DAT12.alt1
DATA9	EIM_DA9.alt0	EIM_D25.alt0	CSI0_DAT13.alt1
DATA10	EIM_DA10.alt0	EIM_D26.alt0	CSI0_DAT14.alt1
DATA11	EIM_DA11.alt0	EIM_D27.alt0	CSI0_DAT15.alt1
DATA12	EIM_DA12.alt0	EIM_D28.alt0	CSI0_DAT16.alt1
DATA13	EIM_DA13.alt0	EIM_D29.alt0	CSI0_DAT17.alt1
DATA14	EIM_DA14.alt0	EIM_D30.alt0	CSI0_DAT18.alt1
DATA15	EIM_DA15.alt0	EIM_D31.alt0	CSI0_DAT19.alt1
ADDR0	EIM_DA0.alt0		
ADDR1	EIM_DA1.alt0		
ADDR2	EIM_DA2.alt0		
ADDR3	EIM_DA3.alt0		
ADDR4	EIM_DA4.alt0		
ADDR5	EIM_DA5.alt0		
ADDR6	EIM_DA6.alt0		
ADDR7	EIM_DA7.alt0		
ADDR8	EIM_DA8.alt0		
ADDR9	EIM_DA9.alt0		
ADDR10	EIM_DA10.alt0		
ADDR11	EIM_DA11.alt0		
ADDR12	EIM_DA12.alt0		
ADDR13	EIM_DA13.alt0		
ADDR14	EIM_DA14.alt0		
ADDR15	EIM_DA15.alt0		

8.5.2 NAND flash

The boot ROM supports a number of MLC/SLC NAND flash devices from different vendors and LBA NAND flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

8.5.2.1 NAND eFUSE configuration

The boot ROM determines the configuration of the external NAND flash by parameters, either provided by the eFUSE, or sampled on the GPIO pins during boot. See Table 8-10 for parameters details.

NOTE

BOOT_CFGx sampled on the GPIO pins depends on the BT_FUSE_SEL setting. See Boot Fusemap for details.

NOTE

For BOOT_CFG[3:2], although ROM always boots from CS0_B, for multiple chip selects, such as some NAND chips which consist of multi CS. This fuse must be burned correctly. The number of devices means the number of chip selects.

Table 8-10. NAND boot eFUSE descriptions

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
BOOT_CFG1[7]	OEM	Boot device selection	Yes	0	1—boot from the NAND Interface
BOOT_CFG1[5]	OEM	BT_TOGGLEMODE	Yes	0	0—raw NAND 1—toggle mode NAND
BOOT_CFG1[4]	OEM	Override pad settings	Yes	0	0—use the default values 1—use the PAD_SETTINGS values
BOOT_CFG1[3:2]	OEM	Number of devices	Yes	00	00—1 device 01—2 device 10—4 device 11—Reserved
BOOT_CFG1[1:0]	OEM	Row address cycles	Yes	00	00—3 01—2 10—4 11—5
BOOT_CFG2[7:5]	OEM	Toggle mode 33 MHz preamble delay, read latency	Yes	000	000—16 GPMICLK cycles 001—1 GPMICLK cycles

Table continues on the next page...

Table 8-10. NAND boot eFUSE descriptions (continued)

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
					010—2 GPMICLK cycles 011—3 GPMICLK cycles 100—4 GPMICLK cycles 101—5 GPMICLK cycles 110—6 GPMICLK cycles 111—7 GPMICLK cycles
BOOT_CFG2[4:3]	OEM	Boot search count	Yes	00	00—2 01—2 10—4 11—8
BOOT_CFG2[2:1]	OEM	Pages in block	Yes	00	00—128 01—64 10—32 11—256
BOOT_CFG2[0]	OEM	Reset time	Yes	0	0—12 ms 1—22 ms (LBA NAND)

1. The setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See Table 3 for the corresponding GPIO pin.

8.5.2.2 NAND flash boot flow and Boot Control Blocks (BCB)

There are two BCB data structures:

- FCB
- DBBT

As a part of the NAND media initialization, the ROM driver uses safe NAND timings to search for the Firmware Configuration Block (FCB) that contains the optimum NAND timings, the page address of the Discovered Bad Block Table (DBBT) Search Area, and the start page address of the primary and secondary firmware.

The hardware ECC level to use is embedded inside the FCB block. The FCB data structure is also protected using the ECC. The driver reads raw 2112 bytes of the first sector and runs through the software ECC engine that determines whether the FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments the page number to the Search Stride number of pages to read for the next BCB until the SearchCount pages have been read.

If the search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters the serial download mode.

The FCB contains the page address of the DBBT Search Area, and the page address for primary and secondary boot images. The DBBT is searched in the DBBT Search Area, just like the FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using the starting page address from the FCB.

This figure shows the state diagram of the FCB search:

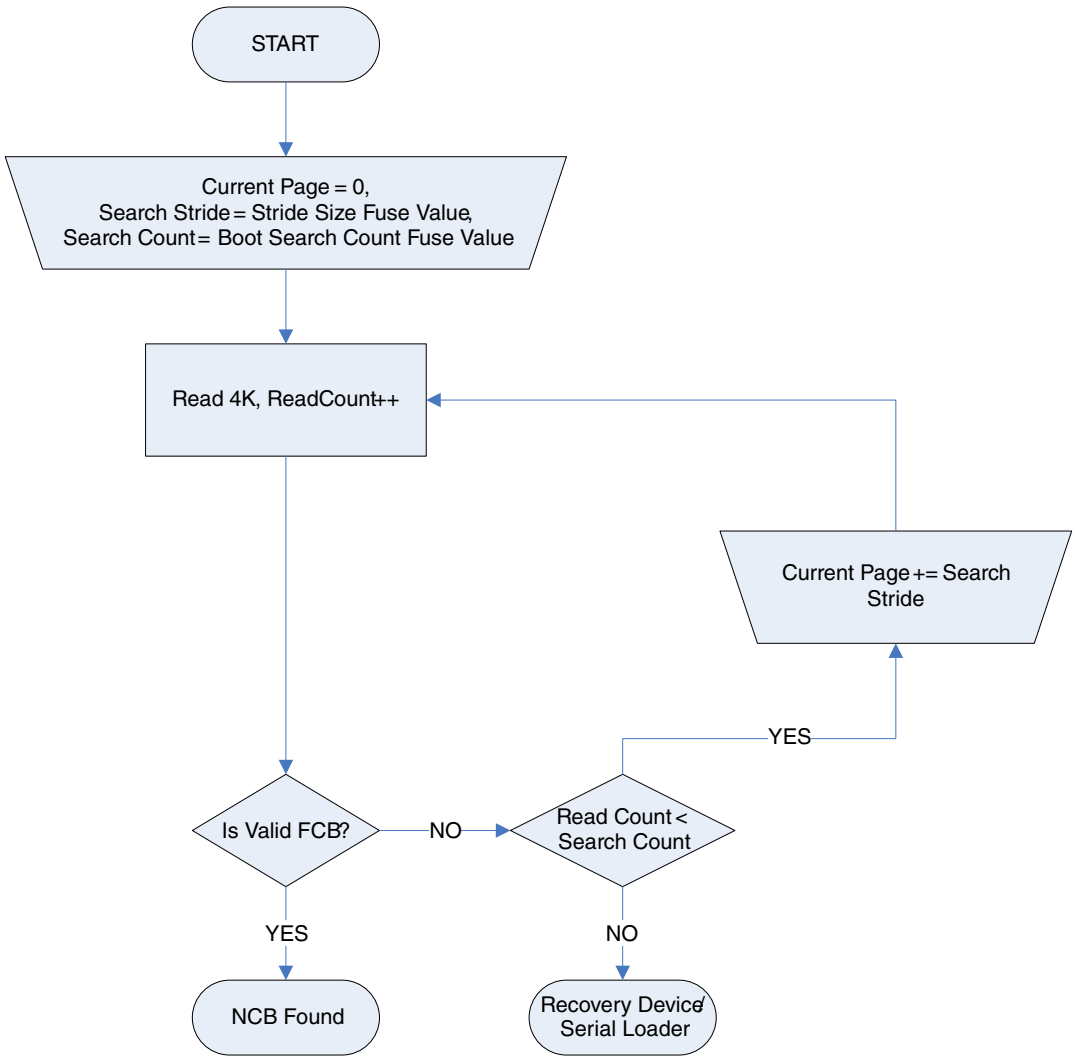

Figure 8-5. FCB search flow

When the FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If the DBBT Search Area is 0 in the FCB, the ROM assumes that there are no bad blocks on the NAND device boot area. See this figure for the DBBT search flow:

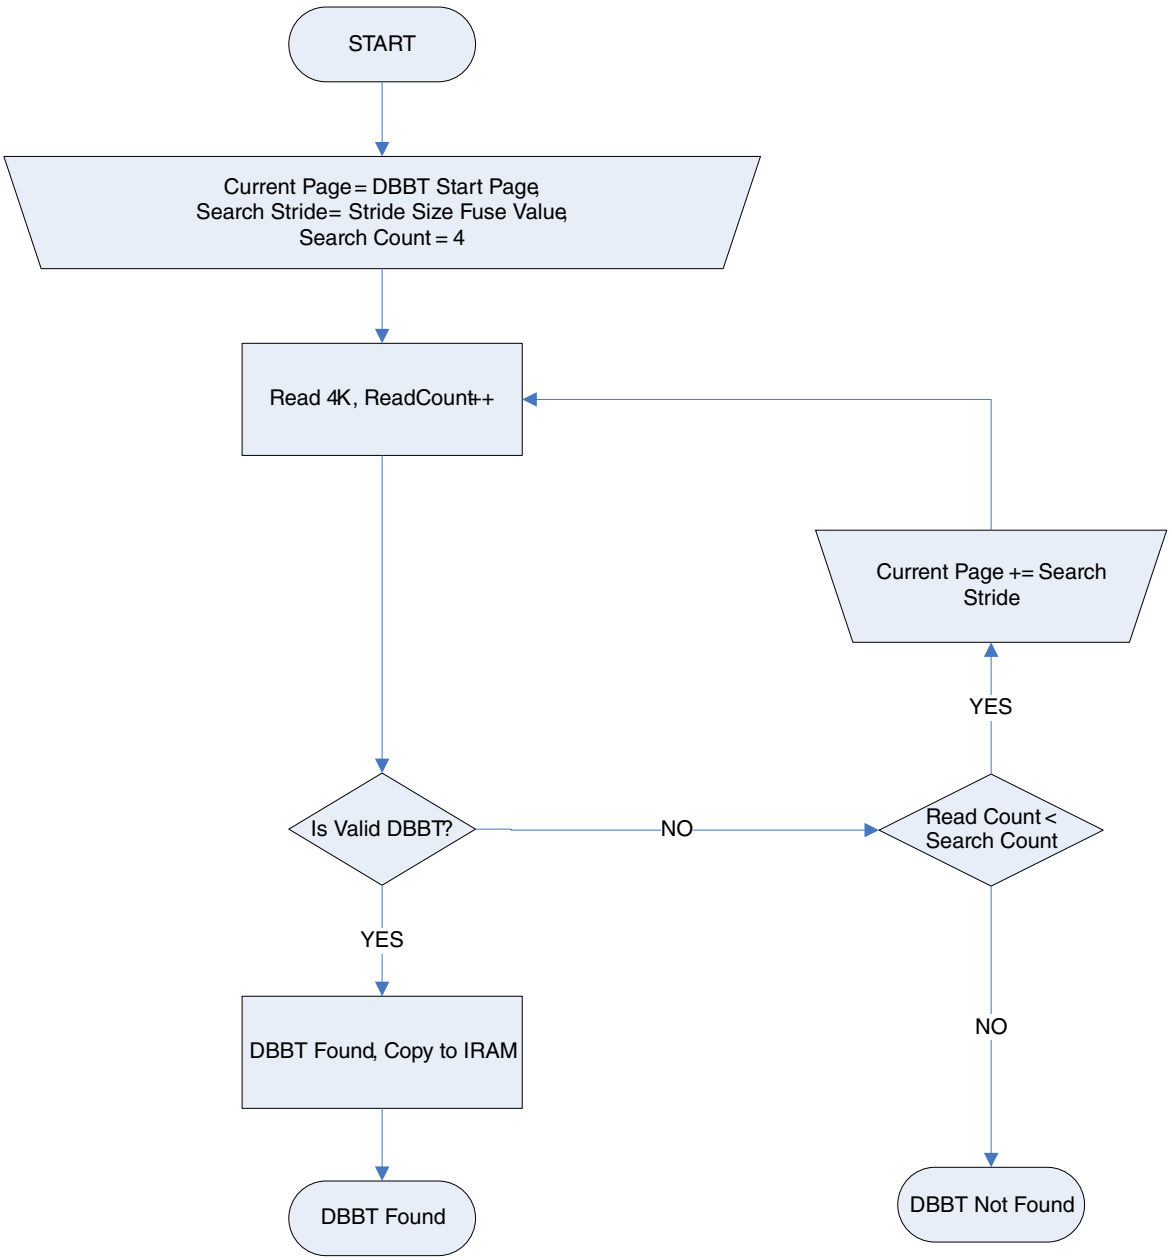

Figure 8-6. DBBT search flow

The BCB search and load function also monitors the ECC correction threshold and sets the PERSIST_BLOCK_REWRITE persistent bit if the threshold exceeds the maximum ECC correction ability.

If there is a page with a number of errors higher than ECC can correct during the primary image read, the boot ROM turns on the PERSIST_SECONDARY_BOOT bit and performs the software reset (After the software reset, the secondary image is used).

If there is a page with number of errors higher than ECC can correct during secondary image read, the boot ROM goes to the serial loader.

8.5.2.3 Firmware configuration block

The FCB is the first sector in the first good block. The FCB must be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so, in case the first NAND block becomes corrupted, the ROM finds its copy in the next NAND block. The search area must span over at least two NAND blocks. The location information for the DBBT search area, FW1, and FW2 are all specified in the FCB. This table shows the flash control block structure:

Table 8-11. Flash control block structure

Name	Start byte	Size in bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32-bit word with a value of 0x20424346, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 B of data for eight NAND timing parameters from the NAND datasheet. The eight parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH. The ROM only uses the first four parameters, but the FCB provides space for other four parameters to be used by the bootloader or other applications.
PageDataSize	20	4	The number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size.
TotalPageSize	24	4	The total number of bytes in a page. Typically, 2112 for 2-KB page or 4224 or 4314 for 4-KB page or 8568 for 8-KB page.

Table continues on the next page...

Table 8-11. Flash control block structure (continued)

Name	Start byte	Size in bytes	Description
SectorsPerBlock	28	4	The number of pages per block. Typically 64 or 128 or depending on the NAND device type.
NumberOfNANDs	32	4	Not used by ROM
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 16 is used to set the BCH Error Corrrection level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring the BCH40 page layout registers.
EccBlock0Size	48	4	Size of block B0 used in configuring the BCH40 page-layout registers.
EccBlockNSize	52	4	Size of block BN used in configuring the BCH40 page-layout registers.
EccBlock0EccType	56	4	Value from 0 to 16 used to set the BCH Error Corrrection level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring the BCH40 page layout registers.
MetadataBytes	60	4	Size of metadata bytes used in configuring the BCH40 page-layout registers.
NumEccBlocksPerPage	64	4	Number of the ECC blocks BN not including B0. This value is used in configuring the BCH40 page-layout registers.
EccBlockNEccLevelSDK	68	4	Not used by ROM
EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where the first copy of bootable firmware is located.
Firmware2_startingPage	108	4	Page number address where the second copy of bootable firmware is located.
PagesInFirmware1	112	4	Size of the first copy of firmware in pages.
PagesInFirmware2	116	4	Size of the second copy of firmware in pages.
DBBTSearchAreaStartAddress	120	4	Page address for the bad block table search area.
BadBlockMarkerByte	124	4	This is an input offset in the BCH page for the ROM to swap with the first byte of metadata after reading a page using the BCH40. The ROM supports the restoration of manufacturer-marked bad block markers in the page and this offset is the bad block marker offset location.

Table continues on the next page...

Table 8-11. Flash control block structure (continued)

Name	Start byte	Size in bytes	Description
BadBlockMarkerStartBit	128	4	This is an input bit offset in the BadBlockMarkerByte for the ROM to use when swapping eight bits with the first byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where the manufacturer leaves the bad block marker on a page.
BCHType	136	4	0 for BCH20 and 1 for BCH40. The chip is backwards compatible to BCH20 and this field tells the ROM to use the BCH20 or BCH40 block.
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, the ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. The ROM uses this value to configure the timing2 register of the GPMI.
TMSpeed	164	4	This is the toggle mode speed for the ROM to configure the gpmi clock. 0 for 33 MHz, 1 for 40 MHz, and 2 for 66 MHz.
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. The ROM uses this value to configure the timing1 register of the GPMI.
DISBBM	172	4	If 0, the ROM swaps the BadBlockMarkerByte with metadata[0] after reading a page using the BCH40. If the value is 1, the ROM does not swap.
BBMark_spare_offset	176	4	The offset in the metadata place which stores the data in the bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support.
Onfi_sync_speed	184	4	Speed for the Onfi nand sync mode: 0 - 24 MHz, 1 - 33 MHz, 2 - 40 MHz, 3 - 50 MHz, 4 - 66 MHz, 5 - 80 MHz, 6 - 100 MHz, 7 - 133 MHz, 8 - 160 MHz, 9 - 200 MHz

Table continues on the next page...

Table 8-11. Flash control block structure (continued)

Name	Start byte	Size in bytes	Description
Onfi_syncNANDData	188	28	The parameters for the Onfi nand sync mode timing. They are read latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, and busy_timeout.
DISBB_Search	216	4	Disable the bad block search function when reading the firmware, only using DBBT.

8.5.2.4 Discovered Bad Block Table (DBBT)

See this table for the DBBT format:

Table 8-12. DBBT structure

Name	Start byte	Size in bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254,in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of the DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
-	-	-	Next bad block number
-	-	-	-
Last bad block number	-	-	Last bad block number

8.5.2.5 Bad block handling in ROM

During the firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If the Bad Block table start page is null, check the manufactory made Bad Block marker. The location of the Bad Block maker is at the first three or last three pages in every block of the NAND flash. The NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark that a block is bad or not. A value of 0xFF means good block, non-FF means bad block.

To preserve the BI (bad block information), the flash updater or gang programmer applications must swap the Bad Block Information (BI) data to byte 0 of the metadata area for every page before programming the NAND flash. When the ROM loads the firmware, it copies back the value at metadata[0] to the BI offset in the page data. This figure shows how the factory bad block marker is preserved:

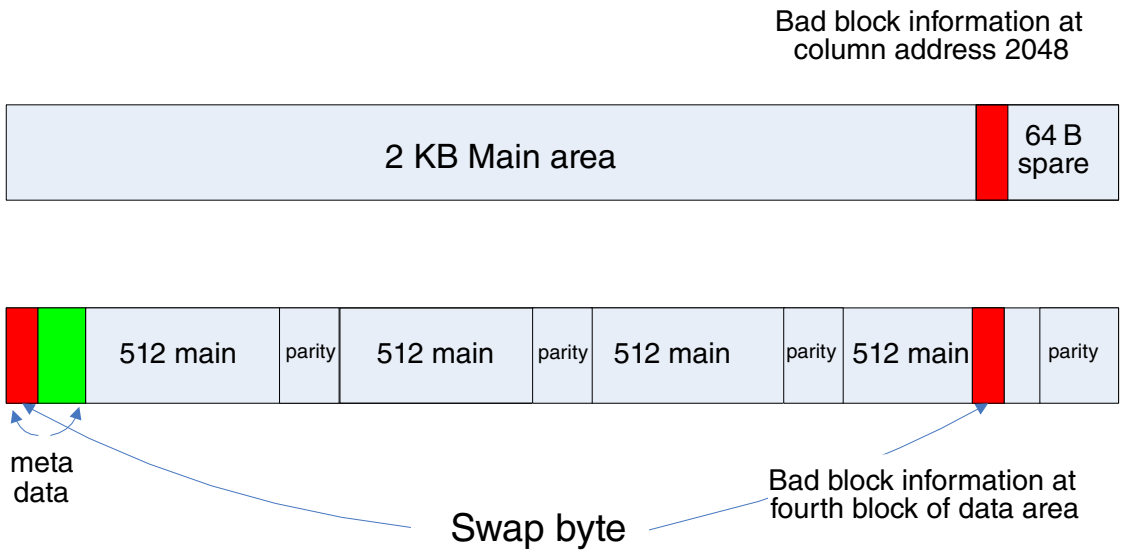

Figure 8-7. Factory bad block marker preservation

In the FCB structure, there are two elements (m_u32BadBlockMarkerByte and m_u32BadBlockMarkerStartBit) to indicate the byte and bit place in the page data that the manufacturer marked the bad block marker.

8.5.2.6 Toggle mode DDR NAND boot

If the BT_TOGGLEMODE efuse is blown, the ROM does the following to boot from the Samsung's toggle mode DDR NAND.

8.5.2.6.1 GPMI and BCH clocks configuration

The ROM sets the clock source and the dividers in the CCM registers.

If the BOOT_CFG1[5] is set (toggle mode), the GPMI/BCH CLK source is PLL2PFD4, and running at 66 MHz, otherwise the GPMI/ BCH CLK souce is PLL3, running at 24 MHz. The ROM sets the default values to timing0, timing1, and timing2 gpmi registers for 24 MHz clock speed. It uses the BOOT_CFG2[7:5] fuse to configure the GPMI timing2 register parameters preamble delay and read latency. The default value for these parameters is 2 when the fuses are not blown.

The default timing parameter values used by the ROM for the toggle-mode device are:

- Timing0.ADDRESS_SETUP = 5
- Timing0.DATA_SETUP = 10
- Timing0.DATA_HOLD = 10
- Timing1.DEVICE_BUSY_TIMEOUT = 0 x 500
- Timing2.READ_LATENCY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.CE_DELAY = 2
- Timing2.PREAMBLE_DELAY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.POSTAMBLE_DELAY = 3
- Timing2.CMDADD_PAUSE = 4
- Timing2.DATA_PAUSE = 6

The default timing parameters can be overriden by the TMTiming2_ReadLatency, TMTiming2_PreambleDelay, TMTiming2_CEDelay, TMTiming2_PostambleDelay, TMTiming2_CmdAddPause, and TMTiming2_DataPause parameters of the FCB.

8.5.2.6.2 Setup DMA for DDR transfers

In the DMA descriptors, the GPMI is configured to read the page data at a double data rate, the word length is set to 16, and the transfer count to a half of the page size.

8.5.2.6.3 Reconfigure timing and speed using values in FCB

After reading the FCB page with the GPMI set to default timings and a speed of 33 MHz, the ROM reconfigures the CCM dividers to run the gpmi/bch clks to a desired speed specified in the FCB for the rest of the boot process. The GPMI timing registers are also reconfigured to the values specified in the FCB.

The GPMI speed can be configured using the FCB parameter TMSpeed:

- 0—24 MHz
- 1—33 MHz
- 2—40 MHz
- 3—50 MHz
- 4—66 MHz
- 5—80 MHz

- 6—100 MHz
- 7—133 MHz
- 8—160 MHz
- 9—200 MHz

The GPMI timing0 register fields data_setup, data_hold, and address_setup are set to the values specified for the data_setup and data_hold and address_setup in the FCB member m_NANDTiming.

The GPMI timing1.DEVICE_BUSY_TIMEOUT is set to the value specified in the FCB member TMTiming1_BusyTimeout.

The GPMI timing2 register values are set using the FCB members TMTiming2.READ_LATENCY, CE_DELAY, PREAMBLE_DELAY, POSTAMBLE_DELAY, CMDADD_PAUSE, and DATA_PAUSE.

8.5.2.7 Typical NAND page organization

8.5.2.7.1 BCH ECC page organization

The first data block is called block 0 and the rest of the blocks are called block N. A separate ECC level scan is used for block 0 and block N.

The metadata bytes must be located at the beginning of a page, starting at byte 0, followed by the data block 0, the ECC bytes for data block 0, the block 1 and its ECC bytes, and so on, up until the N data blocks. The ECC level for the block 0 can be different from the ECC level for the rest of the blocks.

For the NAND boot with page-size restrictions and the data block size restricted to 512 B, only few combinations of the ECC for block 0 and block N are possible.

This figure shows the valid layout for 2112-byte sized page.

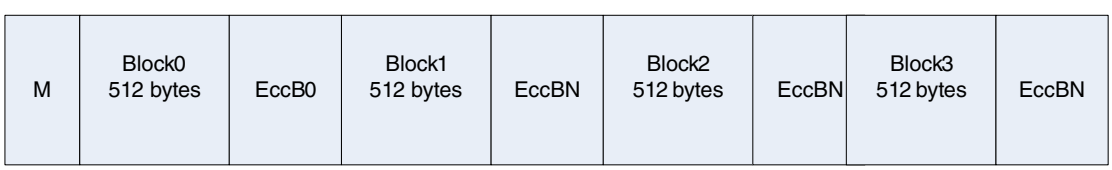

Figure 8-8. Valid layout for 2112-byte sized page

The example below is for 13 bits of parity (GF13). The number of ECC bits required for a data block is calculated using the (ECC_Correction_Level * 13) bits.

In the above layout, the ECC size for EccB0 and EccBN must be selected to not exceed a total page size of 2112 bytes. The EccB0 and EccBN can be one of the 2, 4, 6, 8, 10, 12, 14, 16, 18, and 20 bits on the ECC correction level. The total bytes are:

[M + (data_block_size x 4) + ([EccB0 + (EccBN x 3)] x 13) / 8] <= 2112;

M = metadata bytes and data_block_size is 512.

There are four data blocks of 512 bytes each in a page of 2-KB page sized NAND. The values of EccB0 and EccBN must be such that the above calculation does not result in a value greater than 2112 bytes.

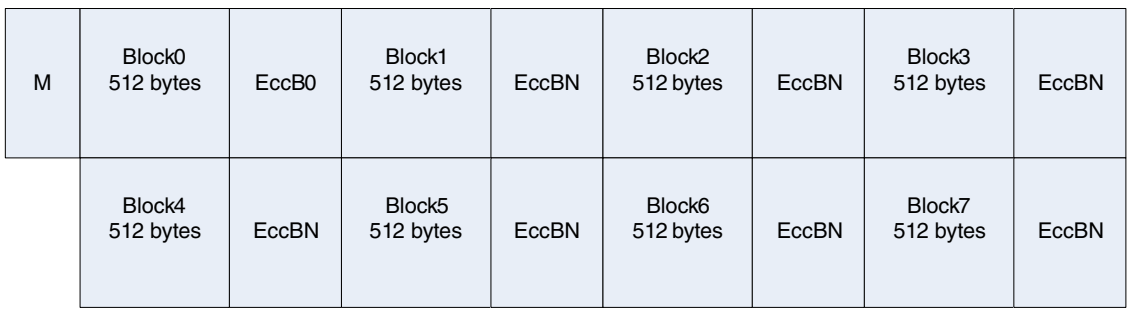

Figure 8-9. Valid layout for 4-KB sized page

Different NAND manufacturers have different sizes for a 4-KB page; 4314 bytes is typical.

[M + (data_block_size x 8) + ([EccB0 + (EccBN x 7)] x 13) / 8] <= 4314;

M= metadata bytes and data_block_size is 512.

There are eight data blocks of 512 bytes each in a page of a 4-KB page sized NAND. The values of the EccB0 and EccBN must be such that the above calculation does not result in a value greater than the size of a page in a 4-KB page NAND.

8.5.2.7.2 Metadata

The number of bytes used for the metadata is specified in the FCB. The metadata for the BCH encoded pages is placed at the beginning of a page. The ROM only cares about the first byte of metadata to swap it with a bad block marker byte in the page data after each page read; it is important to have at least one byte for the metadata bytes field in the FCB data structure.

8.5.2.8 IOMUX configuration for NAND

The following table shows the RawNAND IOMUX pin configuration. The NAND boot is only supported on chip select 0.

Table 8-13. NAND IOMUX pin configuration

Signal	Pad name
CLE	NANDF_CLE.alt0
ALE	NANDF_ALE.alt0
WPN	NANDF_WP_B.alt0
RD_N	SD4_CMD.alt1
WRN	SD4_CLK.alt1
READY0	NANDF_RB0.alt0
DQS	SD4_DAT0.alt2
CE0N	NANDF_CS0.alt0
CE1N	NANDF_CS1.alt0
CE2N	NANDF_CS2.alt0
CE3N	NANDF_CS3.alt0
D0	NANDF_D0.alt0
D1	NANDF_D1.alt0
D2	NANDF_D2.alt0
D3	NANDF_D3.alt0
D4	NANDF_D4.alt0
D5	NANDF_D5.alt0
D6	NANDF_D6.alt0
D7	NANDF_D7.alt0

8.5.3 Expansion device

The ROM supports booting from the MMC/eMMC and SD/eSD compliant devices.

8.5.3.1 Expansion device eFUSE configuration

The SD/MMC/eSD/eMMC/SDXC boot can be performed using either the USDHC ports, based on the setting of the BOOT_CFG2[4:3] (Port Select) fuse or it is associated to the GPIO input value at the boot.

All USDHC ports support the eMMC4.3 and eMMC4.4 fast boot. See this table for details:

Table 8-14. USDHC boot eFUSE descriptions

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
BOOT_CFG1[7:6]	OEM	Boot device selection	Yes	00	01 - Boot from the USDHC interfaces
BOOT_CFG1[5]	OEM	SD/MMC selection	Yes	0	0 - SD/eSD/SDXC 1 - MMC/eMMC
BOOT_CFG1[4]	OEM	Fast boot support	Yes	0	0 - Normal boot 1 - Fast boot
BOOT_CFG1[3:2]	OEM	SD/MMC speed mode	Yes	00	MMC 0 - High-speed mode 1 - Normal-speed mode SD 00 - Normal (SDR12) 01 - High (SDR25) 10 - SDR50 11 - SDR104
BOOT_CFG1[1]	OEM	SD power cycle enable/ eMMC reset enable	Yes	0	MMC 0 - eMMC reset disabled 1 - eMMC reset enabled via the SD_RST pad (on USDHC3 and USDHC4 only) SD 0 - No power cycle 1 - Power cycle enabled via the SD_RST pad (on USDHC3 and USDHC4 only)
BOOT_CFG1[0]	OEM	SD loopback clock source sel (for SDR50 and SDR104 only)	Yes	0	0 - Through the SD pad 1 - Direct
BOOT_CFG2[7:5]	OEM	Bus width/SD calibration step	Yes	000	SD/eSD/SDXC (BOOT_CFG1[5]=0) Bus width xx0 - 1-bit xx1 - 4-bit SD calibration step 00x - 1 delay cells 01x - 1 delay cells 10x - 2 delay cells 11x - 3 delay cells MMC/eMMC (BOOT_CFG1[5]=1) 000 - 1-bit 001 - 4-bit 010 - 8-bit

Table continues on the next page...

Table 8-14. USDHC boot eFUSE descriptions (continued)

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
					101 - 4-bit DDR (MMC 4.4) 110 - 8-bit DDR (MMC 4.4) Else - reserved
BOOT_CFG2[4:3]	OEM	Port select	Yes	00	00 - USDHC-1 01 - USDHC-2 10 - USDHC-3 11 - USDHC-4
BOOT_CFG2[2]	OEM	Boot frequencies	Yes	0	0 - Boot ROM default 1 - Apply value per fuse field MMC_DLL_DLY[6:0]
BOOT_CFG2[1]	OEM	Boot acknowledge disable/ pull down during power cycle enable	Yes	0	MMC 0 - Boot acknowledge enabled 1 - Boot acknowledge disabled SD 0 - Use default SD pad settings during the power cycle 1 - Set pull-down on SD pads during the power cycle (used only if "SD Power Cycle Enable" is enabled)
BOOT_CFG2[0]	OEM	Override pad settings	Yes	0	0 - Use default values 1 - Use PAD_SETTINGS values
MMC_DLL_DLY[6:0]	OEM	MMC DLL value/UHSI calibaration start value	No	0000000	MMC DLL value/UHSI calibration start value

1. The setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See GPIO boot overrides for the corresponding GPIO pin.

The boot code supports these standards:

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST_BOOT
- SDXCv3.0

The MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4 KB of data from the MMC/SD/eSD/eMMC device to the internal RAM. After checking the Image Vector Table header value (0xD1) from program image, the ROM code performs a DCD check. After a successful DCD

extraction, the ROM code extracts from the Boot Data Structure the destination pointer and length of image to be copied to the RAM device from where the code execution occurs.

The maximum image size to load into the SD/MMC boot is 32 MB. This is due to a limited number of uSDHC ADMA Buffer Descriptors allocated by the ROM.

NOTE

The initial 4 KB of the program image must contain the IVT, DCD, and the Boot Data structures.

Table 8-15. SD/MMC frequencies

	SD	MMC	MMC (DDR mode)
Identification (KHz)	347.22		
Normal-speed mode (MHz)	25	20	25
High-speed mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

NOTE

The boot ROM code reads the application image length and the application destination pointer from the image.

8.5.3.2 MMC and eMMC boot

This table provides the MMC and eMMC boot details.

Table 8-16. MMC and eMMC boot details

Normal boot mode	During the initialization (normal boot mode), the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, the voltage validation is performed, and the ROM boot code checks the high-voltage settings and the card capacity. The ROM boot code supports both the high-capacity and low-capacity MMC/eMMC cards. After the initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in the normal boot mode or 40 MHz in the high-speed mode). The eMMC is also interfaced via the USDHC and follows the same flow as the MMC. The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in the BOOT_PARTITION_ENABLE field or the user partition was mentioned, the ROM boots from the user partition.

Table continues on the next page...

Table 8-16. MMC and eMMC boot details (continued)

eMMC4.3 or eMMC4.4 device supporting special boot mode	If using an eMMC4.3 or eMMC4.4 device that supports the special boot mode, it can be initiated by pulling the CMD line low. If the BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via the DATA lines and the ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. If the BOOT ACK is enabled, the ROM waits 50 ms to get the BOOT ACK. If BOOT ACK is disabled ROM waits 1 second for data. If the BOOT ACK or data was received, the eMMC4.3/eMMC4.4 is booted in the "boot mode", otherwise the eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by the BOOT_CFG1[4] (fast boot) fuse. The BOOT ACK is selected by the BOOT_CFG2[1] fuse.
eMMC4.4 device	If using the eMMC4.4 device, the Double Data Rate (DDR) mode can be used. This mode can be selected by the BOOT_CFG2[7:5] (bus width) fuse.

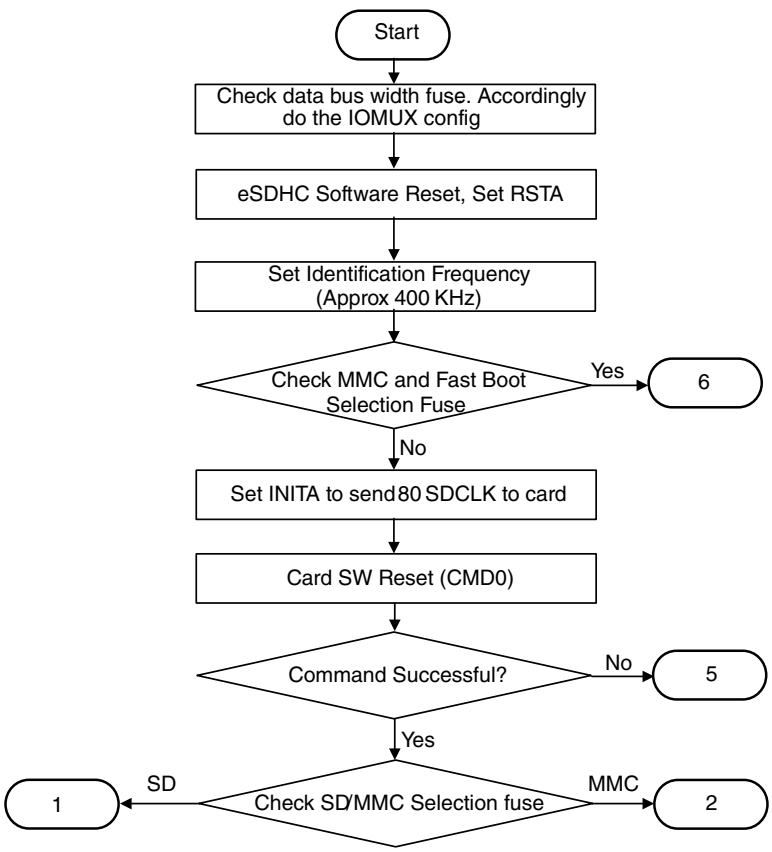

Figure 8-10. Expansion device boot flow (1 of 6)

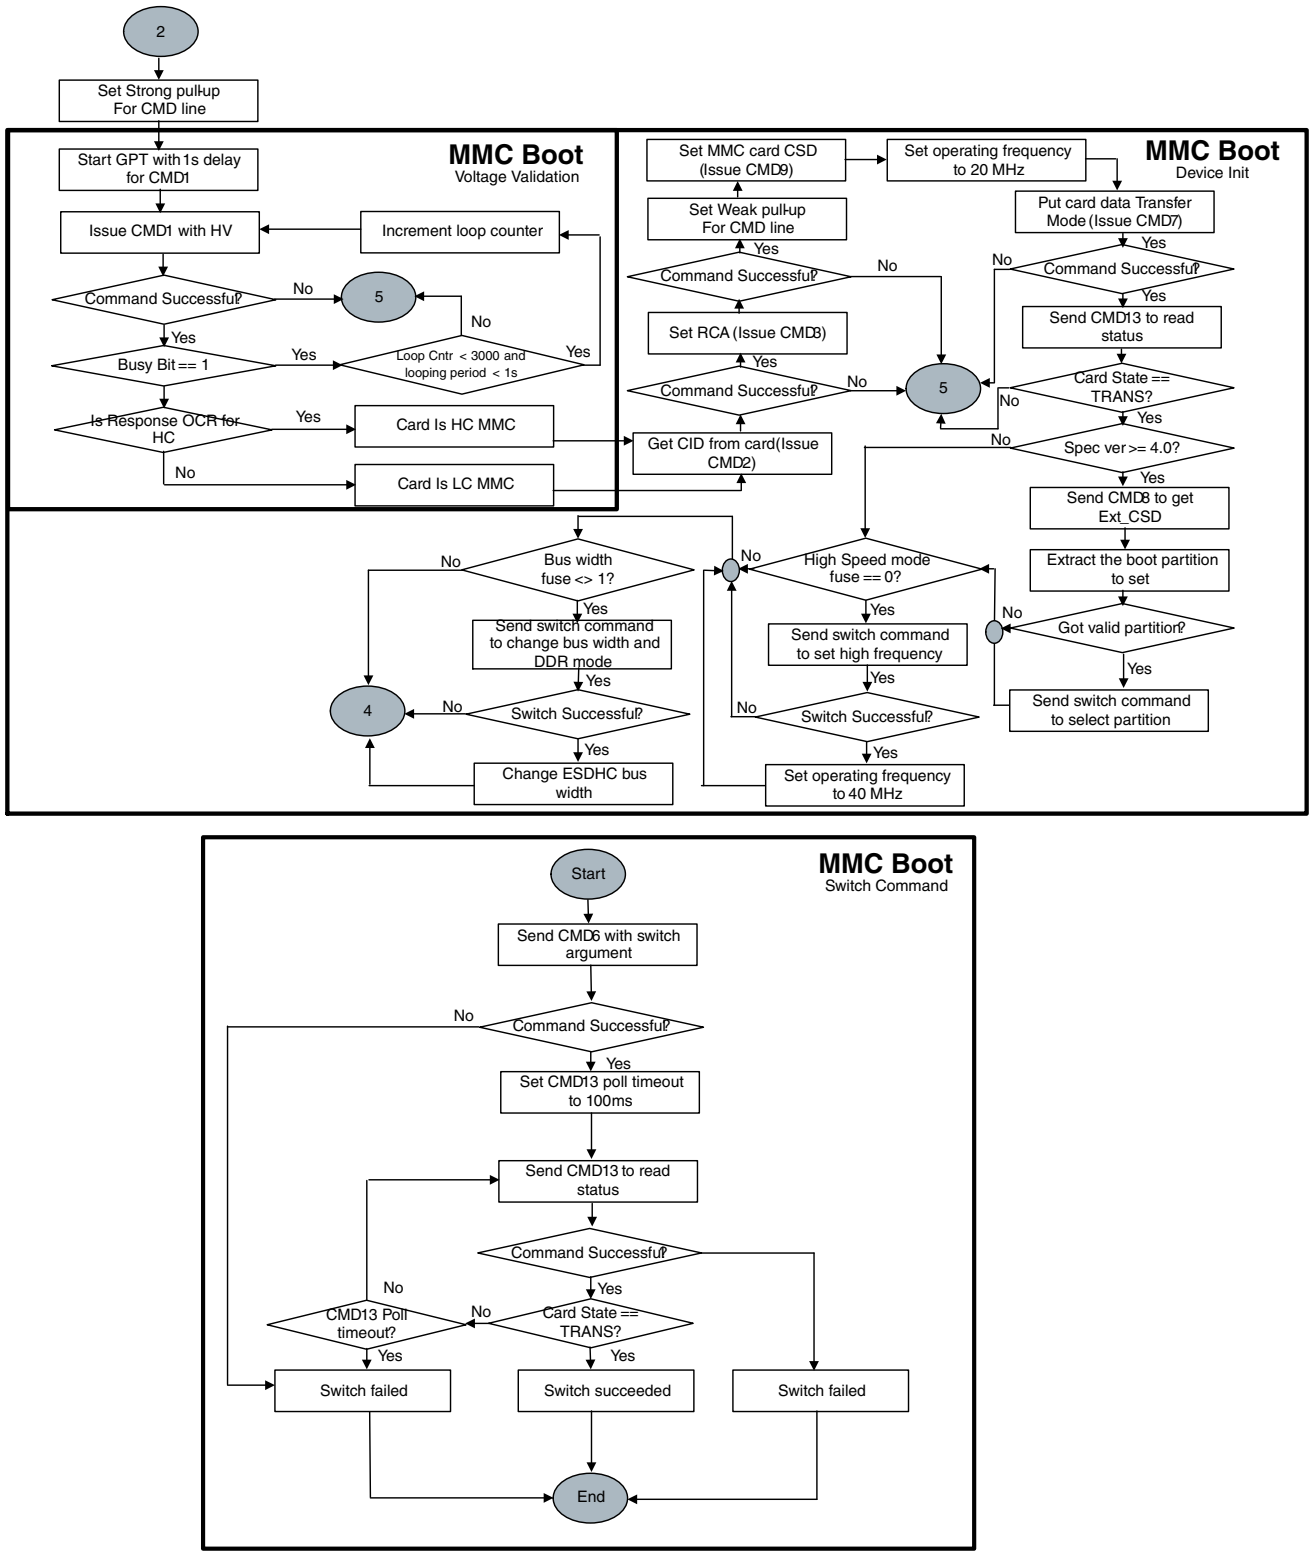

Figure 8-11. Expansion device (MMC) boot flow (2 of 6)

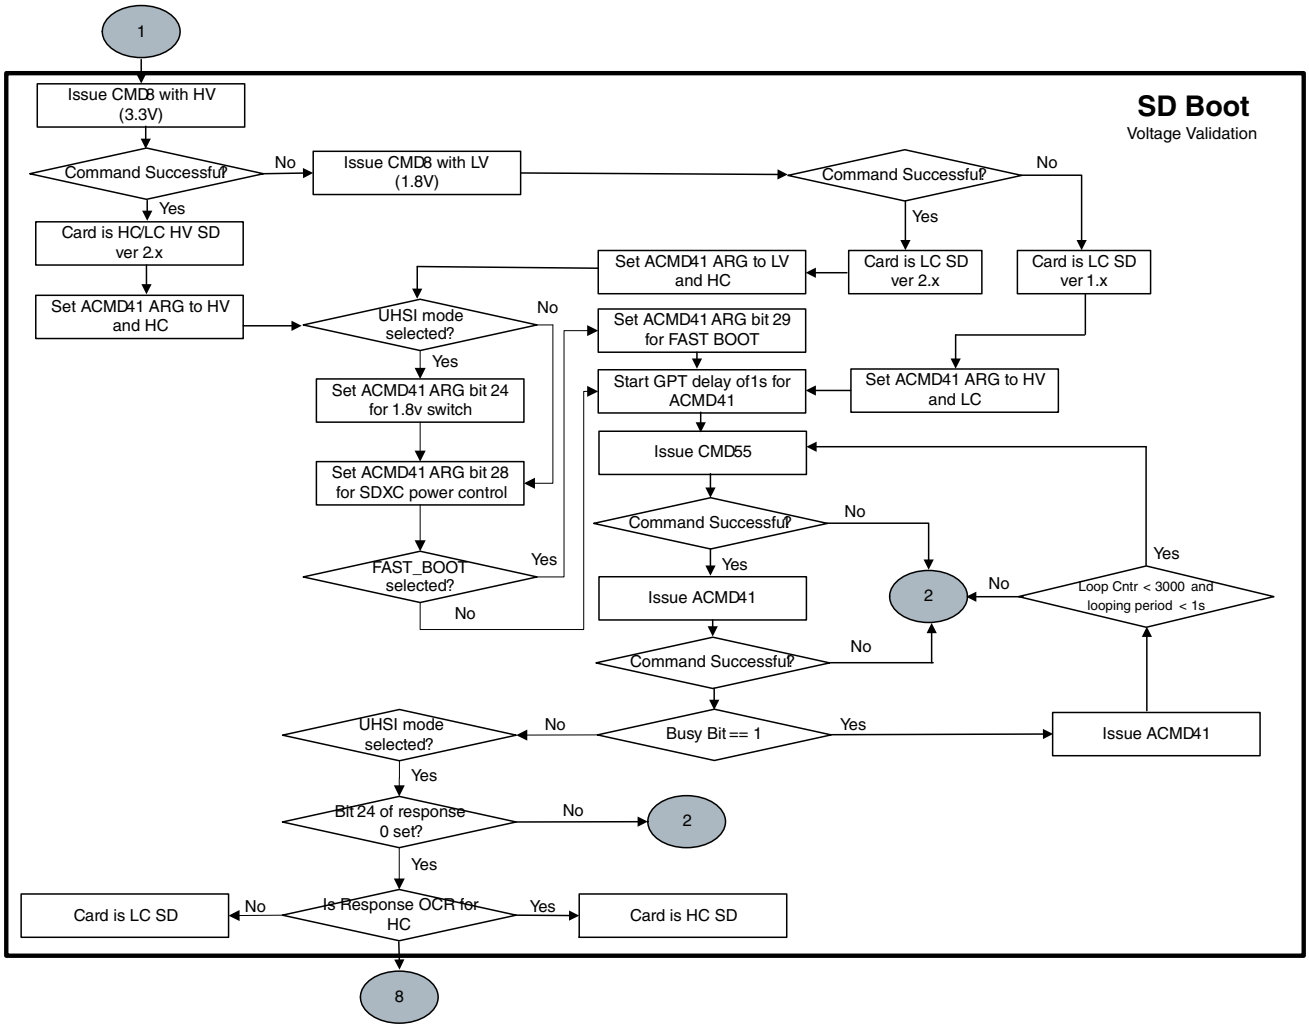

Figure 8-12. Expansion device (SD/eSD/SDXC) boot flow (3 of 6) part 1

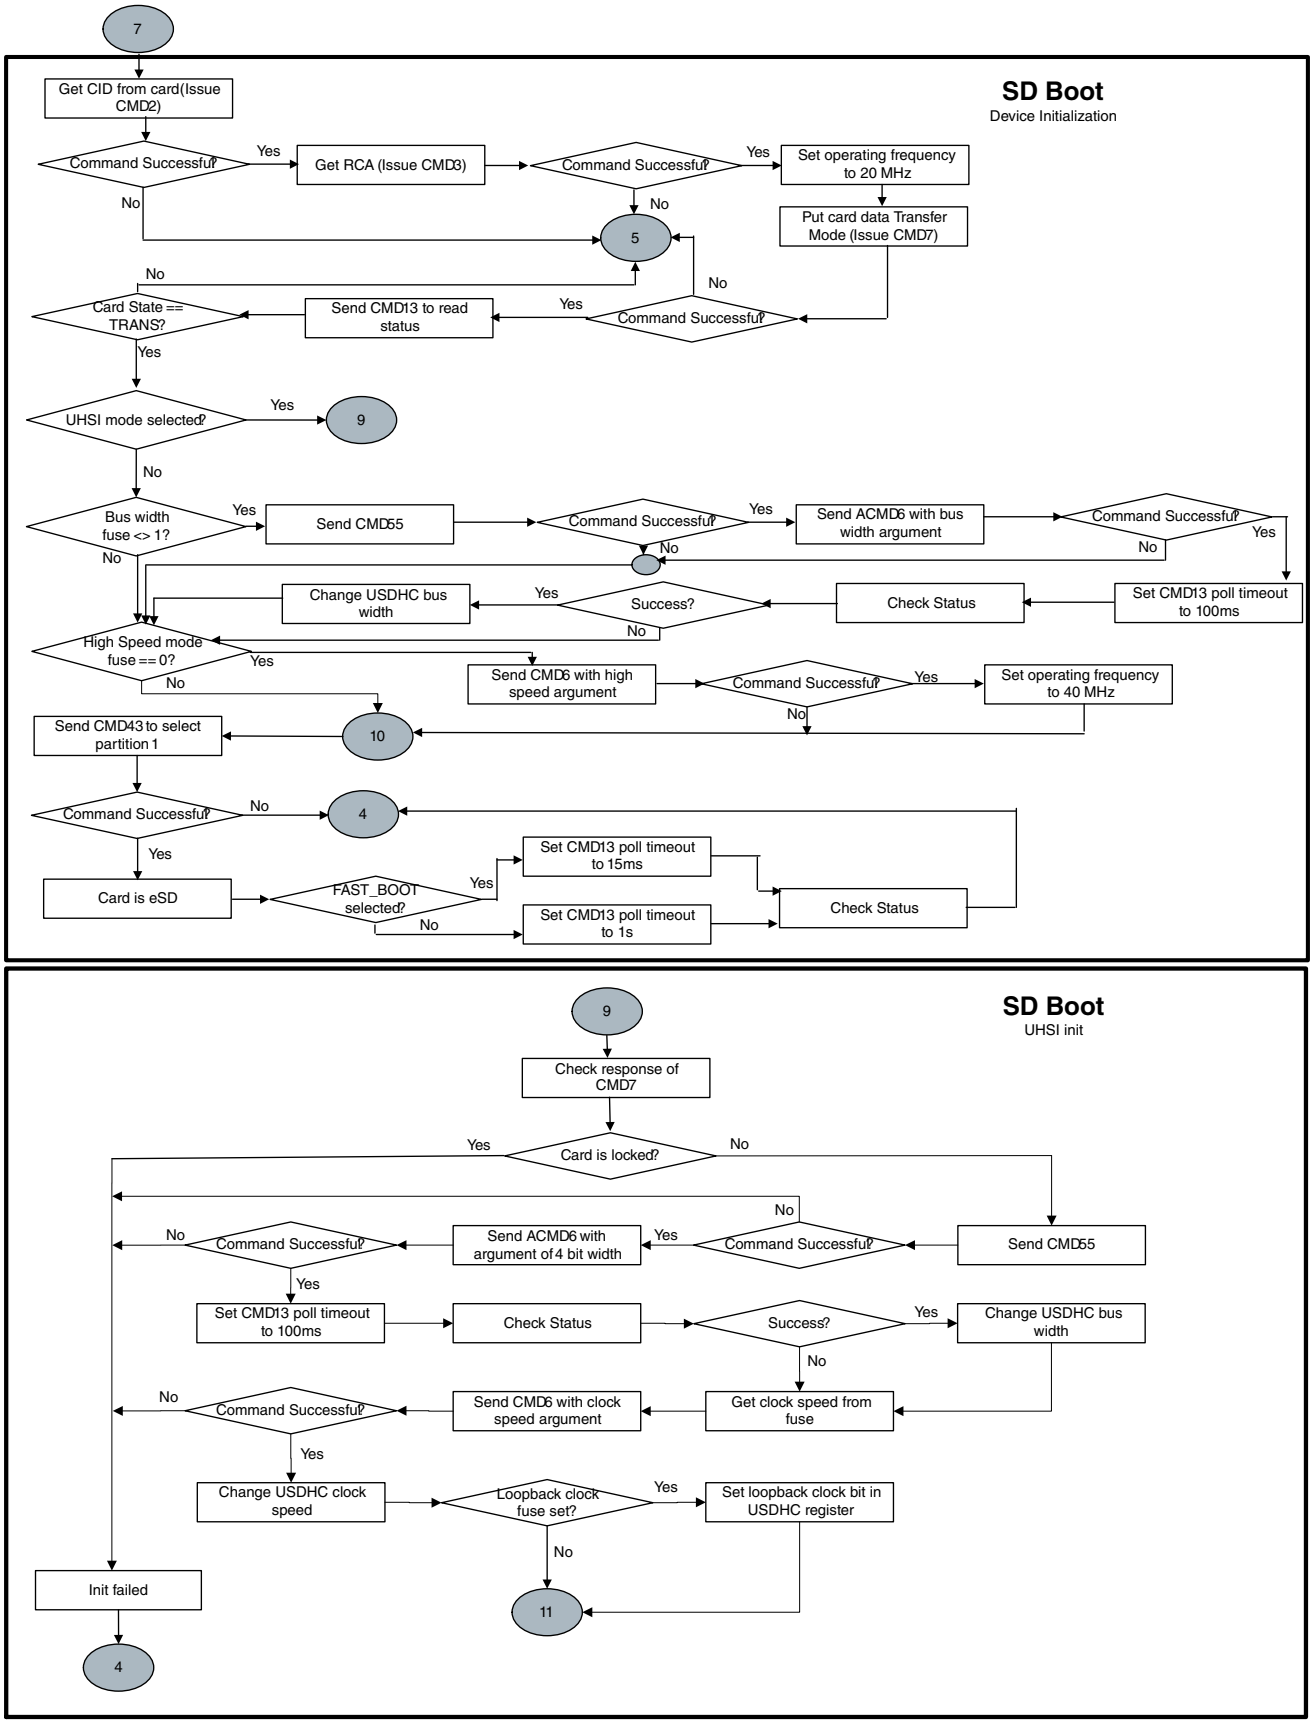

Figure 8-14. Expansion device (MMCSD/eSD/SDXC) boot flow (4 of 6)

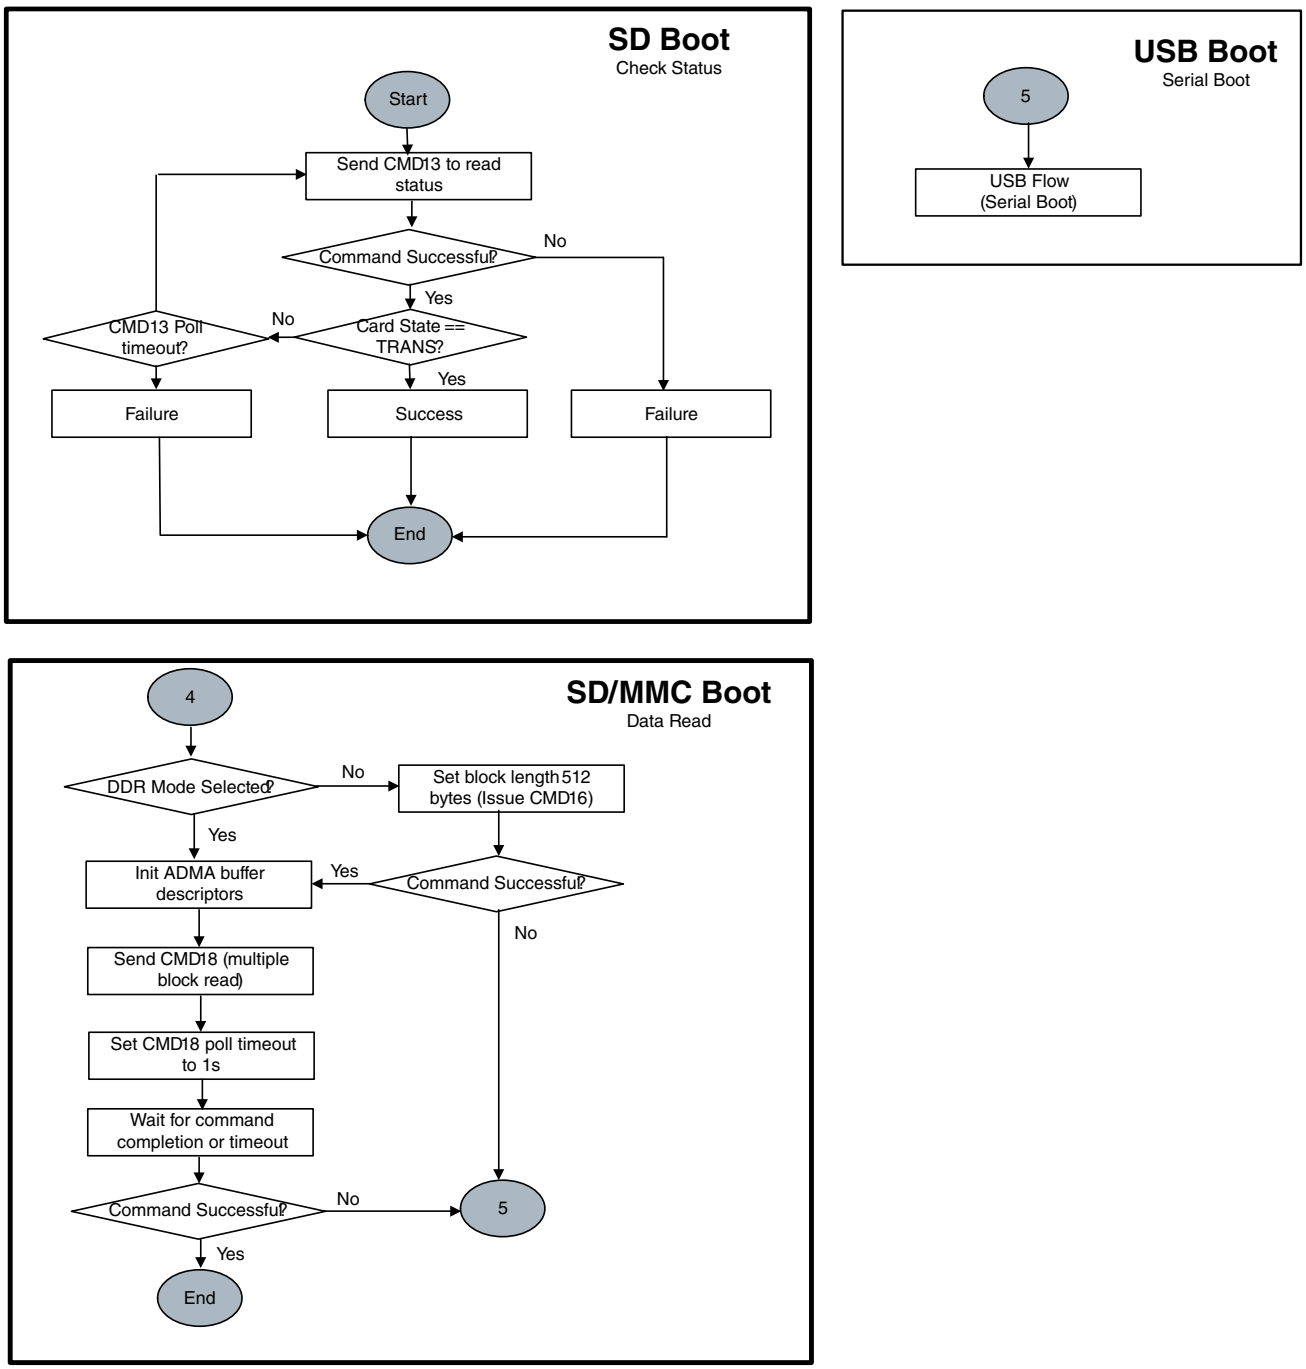

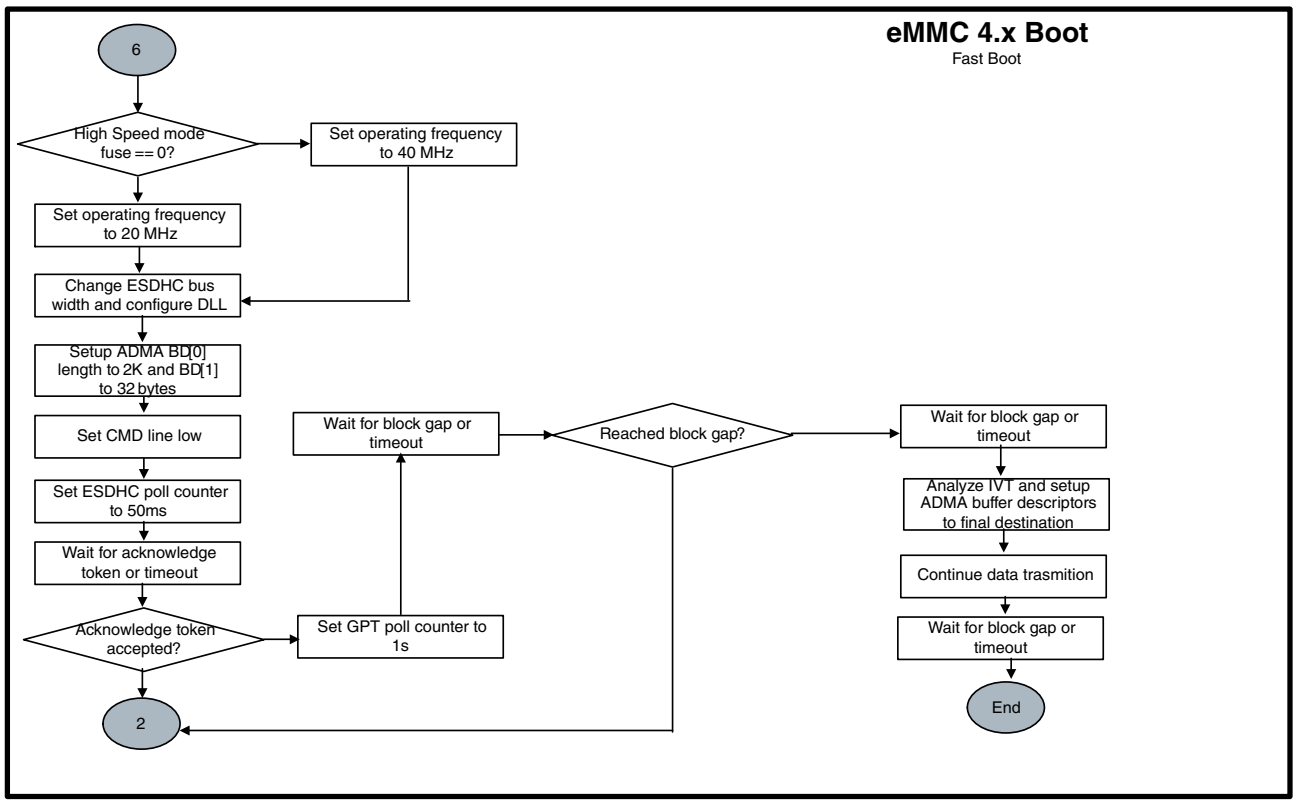

Figure 8-15. Expansion device (SD/eSD) boot flow (5 of 6)

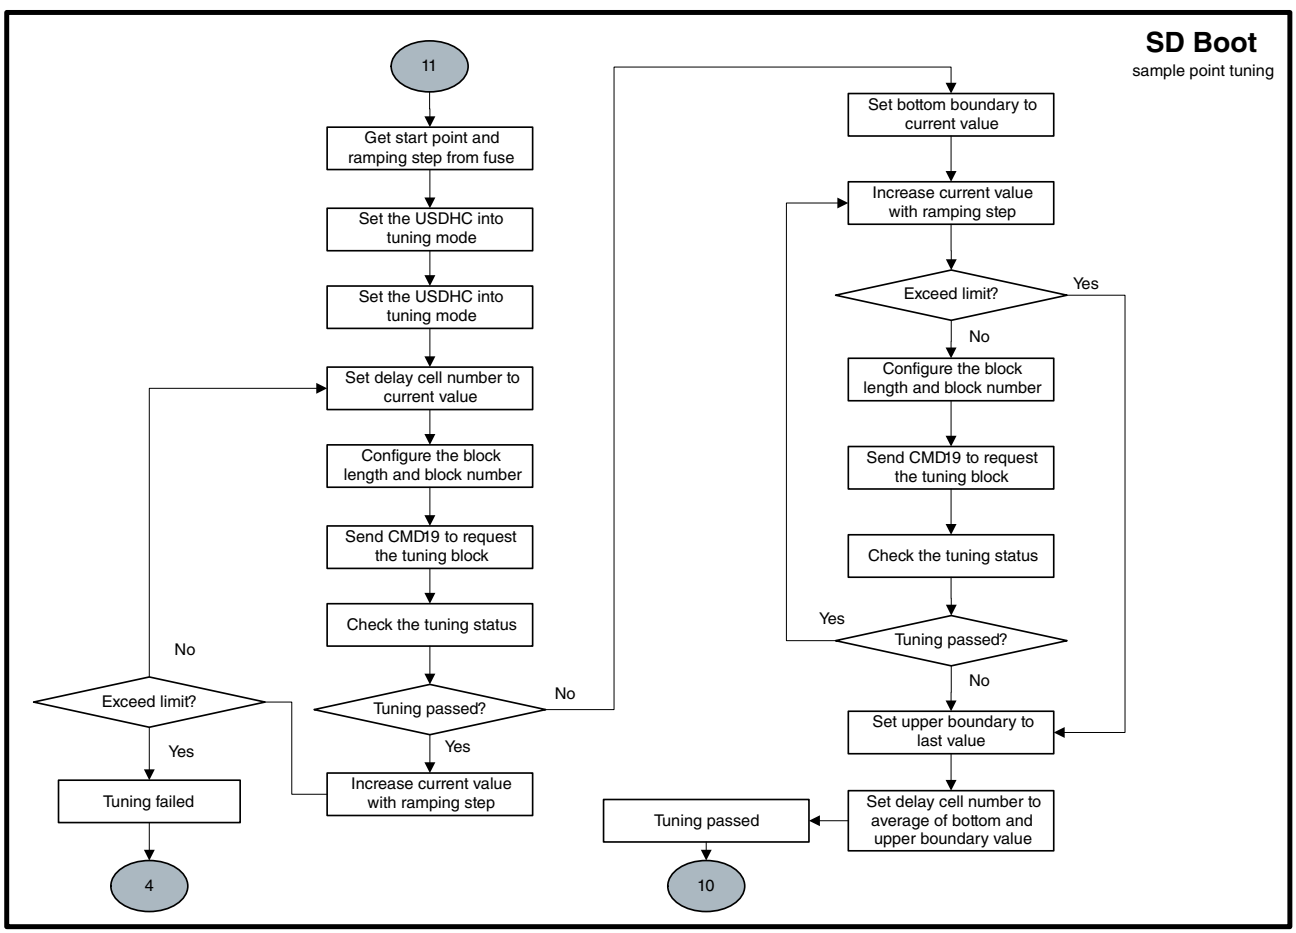

Figure 8-16. Expansion device boot flow (6 of 6)

8.5.3.3 SD, eSD, and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, the SD/eSD/SDXC card voltage validation is performed. During the voltage validation, the boot code first checks with the high-voltage settings; if that fails, it checks with the low-voltage settings.

The capacity of the card is also checked. The boot code supports the high-capacity and low-capacity SD/eSD/SDXC cards after the voltage validation card initialization is done.

During the card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes that the card is a normal SD or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, the boot code switches to a higher frequency (25 MHz in the normal-speed mode or 50 MHz in the high-speed mode). The ROM also supports the FAST_BOOT mode booting from the eSD card. This mode can be selected by the BOOT_CFG1[4] (Fast Boot) fuse described in Table 8-14 .

For the UHSI cards, the clock speed fuses can be set to SDR50 or SDR104 on USDHC3 and USDHC4 ports. This enables the voltage switch process to set the signaling voltage to 1.8 V during the voltage validation. The bus width is fixed at a 4-bit width and a sampling point tuning process is needed to calibrate the number of the delay cells. If the SD Loopback Clock eFuse is set, the feedback clock comes directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by the BOOT_CFG1[3:2], and the SD Loopback Clock is selected by the BOOT_CFG1[0].

NOTE

SDR50 and SDR104 boot are not supported on USDHC1 and USDHC2, because there is no reset signal for those ports in the IOMUXC.

The UHSI calibration start value (MMC_DLL_DLY[6:0]) and the step value (BOOT_CFG2[7:5]) can be set to optimize the sample point tuning process.

If the SD Power Cycle Enable eFuse is 1, the ROM sets the SD_RST pad low, waits for 5 ms, and then sets the SD_RST pad high. If the SD_RST pad is connected to the SD power supply enable logic on board, it enables the power cycle of the SD card. This may be crucial in case the SD logic is in the 1.8 V states and must be reset to the 3.3 V states.

8.5.3.4 IOMUX configuration for SD/MMC

Table 8-17. SD/MMC IOMUX pin configuration

Signal	USDHC-1	USDHC-2	USDHC-3	USDHC-4

1. Active-low

8.5.3.5 Redundant boot support for expansion device

The ROM supports the redundant boot for an expansion device. The primary or secondary image is selected, depending on the PERSIST_SECONDARY_BOOT setting. (see Table 8-6).

If the PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x400 for the primary image.

If the PERSIST_SECONDARY_BOOT is 1, the boot ROM reads the secondary image table from address 0x200 on the boot media and uses the address specified in the table for the secondary image.

Table 8-18. Secondary image table format

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- The tag is used as an indication of the valid secondary image table. It must be 0x00112233.
- The firstSectorNumber is the first 512-byte sector number of the secondary image.

For the secondary image support, the primary image must reserve the space for the secondary image table. See this figure for the typical structures layout on an expansion device.

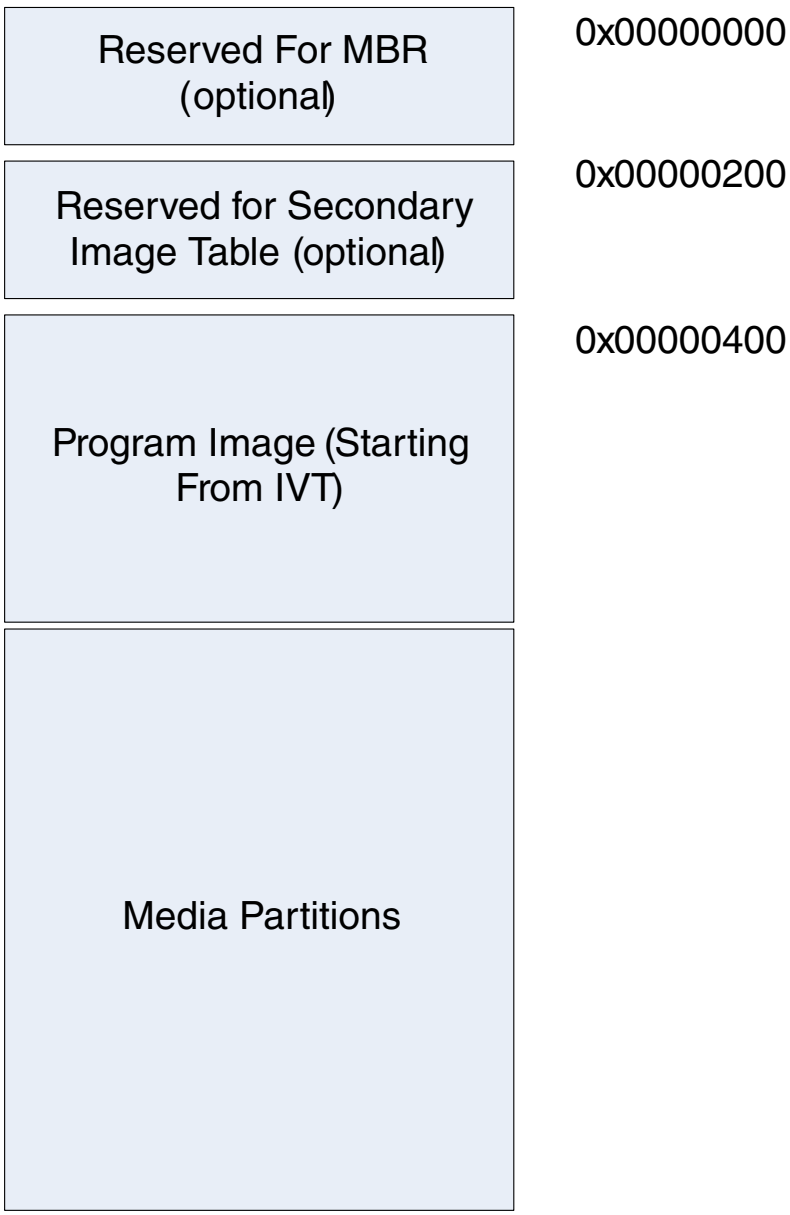

Figure 8-17. Expansion device structures layout

For the Closed mode, if there are failures during primary image authentication, the boot ROM turns on the PERSIST_SECONDARY_BOOT bit (see Table 8-6) and performs the software reset. (After the software reset, the secondary image is used.)

8.5.4 Serial ROM through SPI and I²C

The chip supports booting from serial memory devices, such as EEPROM and serial flash, using the SPI.

These ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) and I²C controller (I2C1, I2C2 and I2C3) interfaces.

8.5.4.1 Serial ROM eFUSE configuration

The boot ROM code determines the type of device using the following parameters, either provided by the eFUSE settings or sampled on the I/O pins, during boot.

See this table for details:

Table 8-19. Serial ROM boot eFUSE descriptions

Fuse	Config	Definition	GPIO[1]	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0000	0011 - Boot from the serial ROM
BOOT_CFG4[6]	OEM	EEPROM recovery enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPIx_SS0 01 - ECSPIx_SS1 10 - ECSPIx_SS2 11 - ECSPIx_SS3
BOOT_CFG4[3]	OEM	SPI addressing (SPI only)	Yes	0	0 - 2 B (16-bit) 1 - 3 B (24-bit)
BOOT_CFG4[2:0]	OEM	Port select	Yes	00	000 - ECSPI-1 001 - ECSPI-2 010 - ECSPI-3 011 - ECSPI-4 101 - I2C1 110 - I2C2 111 - I2C3

1. The setting can be overridden by the GPIO settings when the BT_FUSE_SEL fuse is intact. See GPIO Boot Overrides for the corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as a boot device using the ECSPI interface for the serial ROM boot. The SPI interface is configured to operate at 15 MHz for 3-byte addressing devices and at 3.75 MHz for 2-byte addressing devices.

The I2C-1/I2C-2/I2C-3 block can be used as a boot device using the I^2C interface for the serial ROM boot. The I^2C interface is configured to operate at 343.75 kbit/s.

The boot ROM copies 4 KB of data from the serial ROM device to the internal RAM. After checking the Image Vector Table header value (0xD1) from the program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts the destination pointer and length of image from the Boot Data Structure to be copied to the RAM device from where the code execution occurs.

NOTE

The Initial 4 KB of program image must contain the IVT, DCD, and the Boot Data Structures.

8.5.4.2 I^2C boot

The boot flow when booting from the I^2C device is shown in Figure 8-18.

The boot ROM code reads the fuses BOOT_CFG1[7:4] (Boot Device Selection) and BOOT_CFG1[7:4] (Port select) to detect the EEPROM device type. The ROM program copies 4 KB of data from the EEPROM device to the internal RAM. The boot ROM code then copies the initial 4 KB of data as well as the rest of the image directly to the application destination extracted from the application image.

The chip uses the Device Select Code/Device Address in the following table to boot from the EEPROM.

Table 8-20. EEPROM via I^2C device select code

Bits	Device type identifier				Chip enable address[1]			R/W
	7	6	5	4	3	2	1	0
Device select code	1	0	1	0	0	0	0	R/W

1. These address bits must be configured at the memory device to match this '000' value.

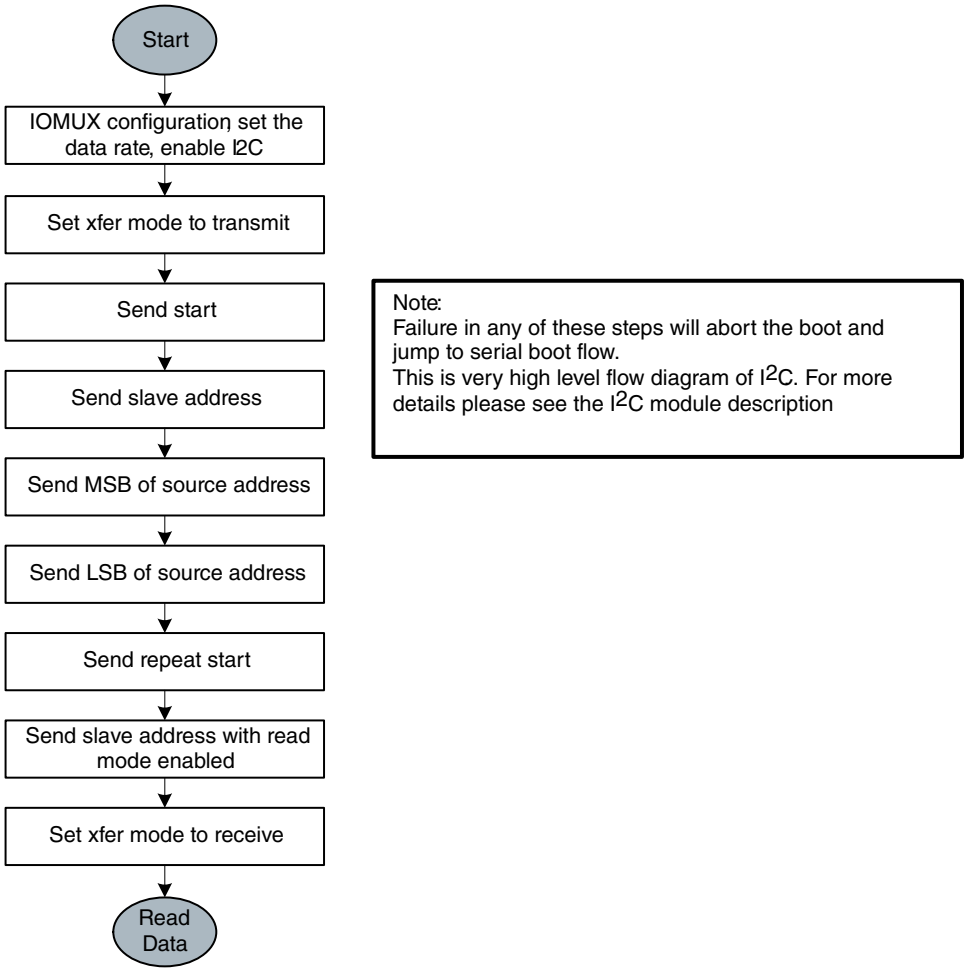

Figure 8-18. I²C flow chart

8.5.4.2.1 I²C IOMUX pin configuration

The contacts assigned to the signals used by the I²C blocks are shown in these tables:

Table 8-21. I²C IOMUX pin configuration

Signal	I2C-1	I2C-2	I2c-3
SDA	EIM_D28.alt1	EIM_D16.alt6	EIM_D18.alt6
SCL	EIM_D21.alt6	EIM_EB2.alt6	EIM_D17.alt6

8.5.4.3 ECSPI boot

The Enhanced Configurable SPI (ECSPI) interface is configured in the master mode and the EEPROM device is connected to the ECSPI interface as a slave.

The boot ROM code copies 4 KB of data from the EEPROM device to the internal RAM. If the DCD verification is successful, the ROM code copies the initial 4 KB of data, as well as the rest of the image extracted from the application image, directly to the application destination. The ECSPI can read data from the EEPROM using 2- or 3-byte addressing. Its burst length is 32 B.

NOTE

The Serial ROM Chip Select Number is determined by the BOOT_CFG4[5:4] (Chip Select) fuse.

When using the SPI as a boot device, the chip supports booting from both the serial EEPROM and serial flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at the boot (see Table 8-19 for details).

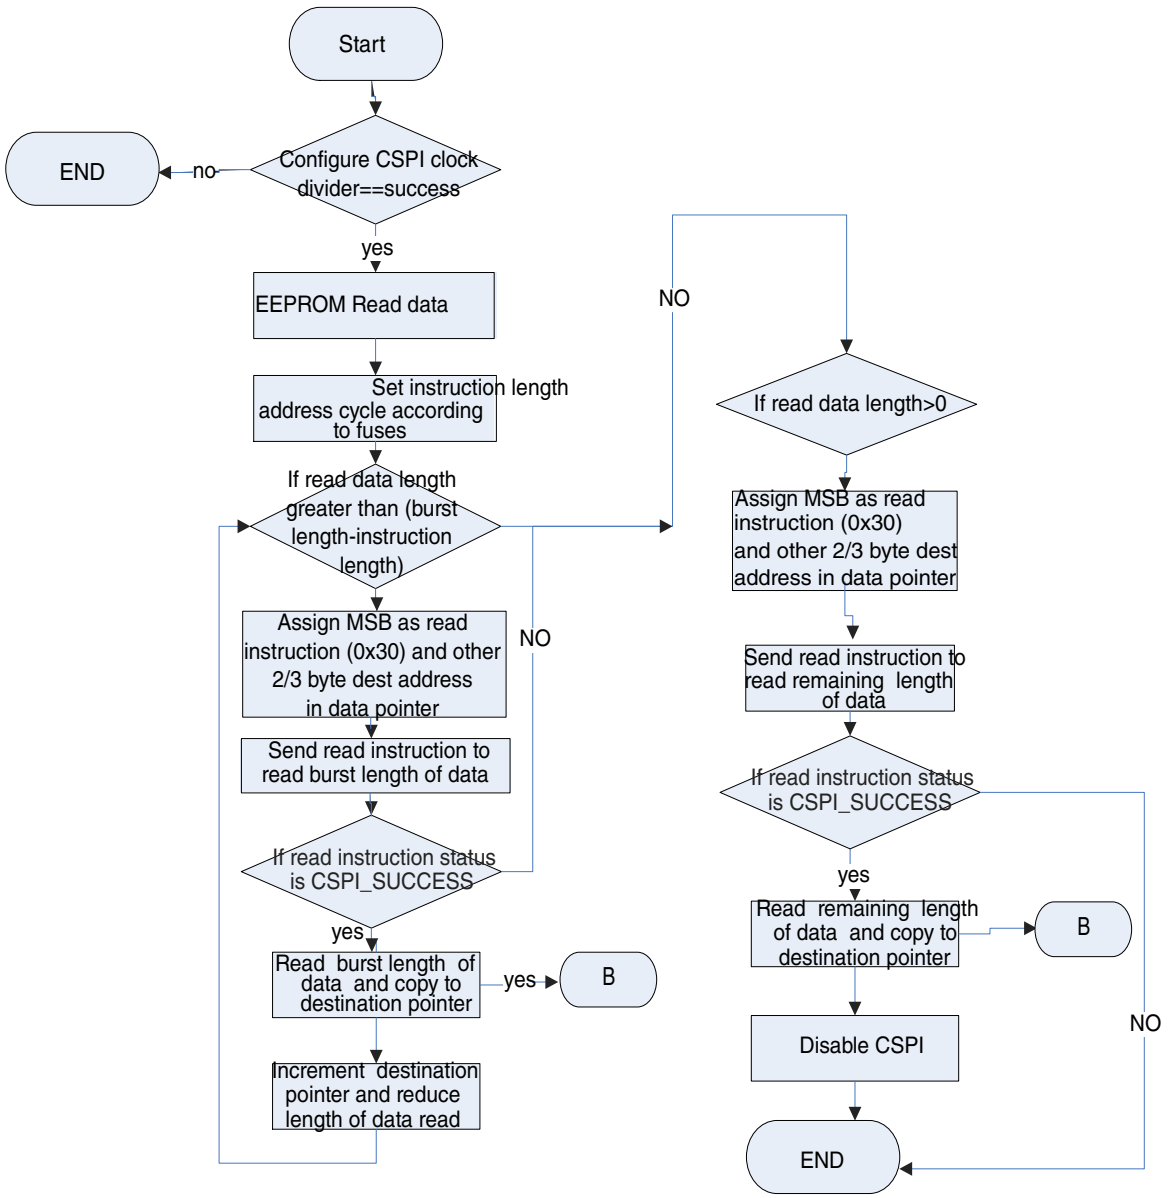

Figure 8-19. CSPI flow chart

8.5.4.3.1 ECSPI IOMUX pin configuration

The contacts assigned to the signals used by the CSPI blocks are shown in this table:

Table 8-22. ECSPI IOMUX pin configuration

Signal	ECSPI-1	ECSPI-2	ECSPI-3	ECSPI4	ECSPI-5
MISO	EIM_D17.alt1	CSI0_DAT10.alt2	DISP0_DAT2.alt2	EIM_D22.alt1	N/A
MOSI	EIM_D18.alt1	CSI0_DAT9.alt2	DISP0_DAT1.alt2	EIM_D28.alt2	N/A

Table continues on the next page...

Table 8-22. ECSPI IOMUX pin configuration (continued)

RDY	N/A[1]	N/A	N/A	N/A	N/A
SCLK	EIM_D16.alt1	CSI0_DAT8.alt2	DISP0_DAT0.alt2	EIM_D21.alt1	N/A
SS0	EIM_EB2.alt1	CSI0_DAT11.alt2	DISP0_DAT3.alt2	EIM_D20.alt1	N/A
SS1	EIM_D19.alt1	EIM_LBA.alt1	DISP0_DAT4.alt2	EIM_A25.alt1	N/A
SS2	EIM_D24.alt1	EIM_D24.alt4	DISP0_DAT5.alt2	EIM_D24.alt1	N/A
SS3	EIM_D25.alt1	EIM_D25.alt4	DISP0_DAT6.alt2	EIM_D25.alt1	N/A

1. The N/A in the ROM code indicates that the pins are not available or not used.

8.6 Program image

This section describes the data structures that are required to be included in the user's program image. The program image consists of:

- Image vector table—a list of pointers located at a fixed address that the ROM examines to determine where the other components of the program image are located.
- Boot data—a table that indicates the program image location, program image size in bytes, and the plugin flag.
- Device configuration data—IC configuration data.
- User code and data.

8.6.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process.The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device

type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder or the image memory map is flexible and is determined by the contents of the IVT.

Table 8-23. Image Vector Table Offset and Initial Load Region Size

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
NAND	1 Kbyte = 0x400 bytes	4 Kbyte
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
I2C/SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

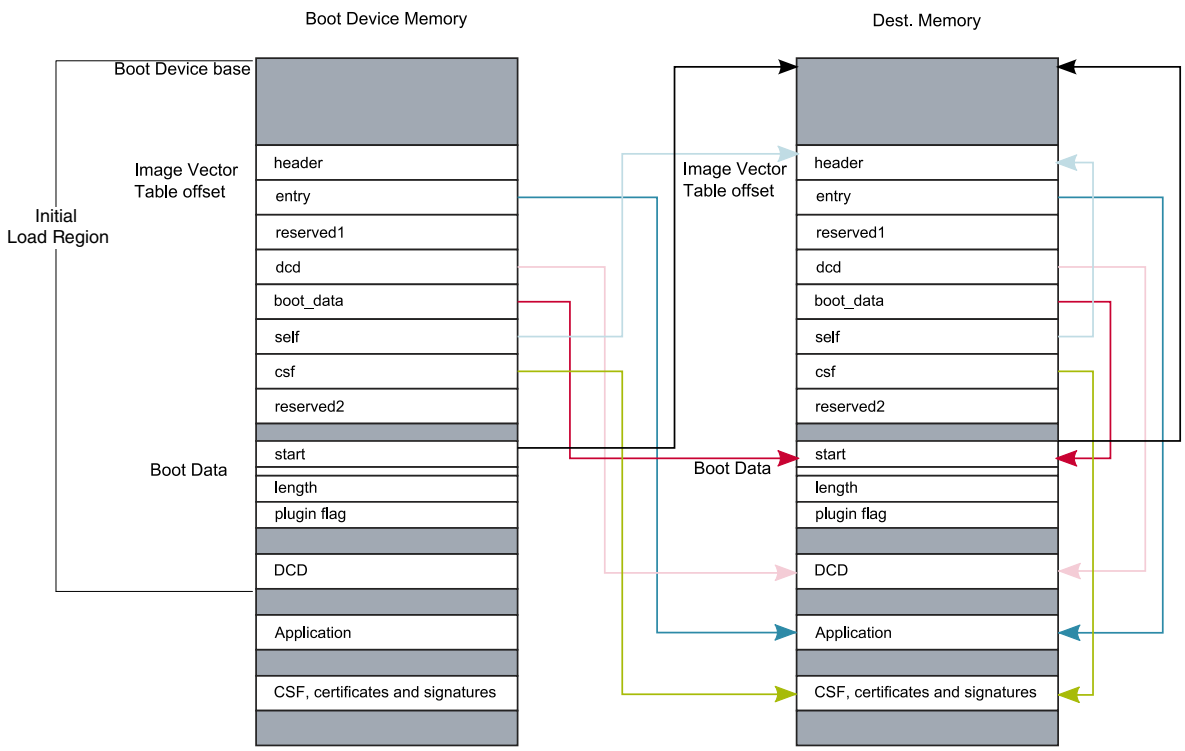

Figure 8-20. Image Vector Table

8.6.1.1 Image vector table structure

The IVT has the following format where each entry is a 32-bit word:

Table 8-24. IVT format

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See Device Configuration Data (DCD) for further details on the DCD.
boot data: Absolute address of the boot data
self: Absolute address of the IVT. Used internally by the ROM.
csf: Absolute address of the Command Sequence File (CSF) used by the HAB library. See High-Assurance Boot (HAB) for details on the secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

Figure 8-21 shows the IVT header format:

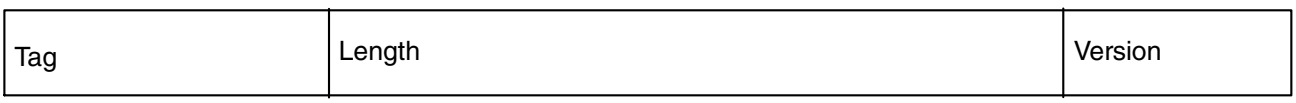

Figure 8-21. IVT header format

where:

```
Tag: A single byte field set to 0xD1
Length: a two byte field in big endian format containing the overall length of the IVT,
in bytes, including the header. (the length is fixed and must have a value of
32 bytes)
Version: A single byte field set to 0x40 or 0x41
```

8.6.1.2 Boot data structure

The boot data must follow the format defined in the table found here, each entry is a 32-bit word.

Table 8-25. Boot data format

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see Plugin image)

8.6.2 Device Configuration Data (DCD)

Upon reset, the chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving the optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is a configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various peripherals on the chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately after the reset. This allows the chip to interface with any NOR flash device, but has the disadvantage of slow performance. Additionally, some components (such as DDR) require some sequence of register programming as a part of the configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and the MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on the information located in the Image Vector Table (IVT). See Image Vector Table and Boot Data for more details. The DCD table shown below is a big-endian byte array of the allowable DCD commands. The maximum size of the DCD is limited to 1768 B.

Figure 8-22. DCD data format

The DCD header is 4 B with the following format:

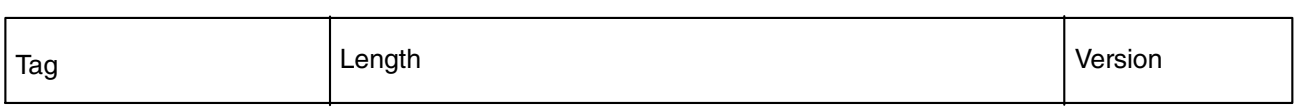

Figure 8-23. DCD header format

where:

Program image

```
Tag: A single-byte field set to 0xD2
Length: a two-byte field in the big-endian format containing the overall length of the DCD
(in bytes) including the header
Version: A single-byte field set to 0x41
```

8.6.2.1 Write data command

The write data command is used to write a list of given 1-, 2- or 4-byte values (or bitmasks) to a corresponding list of target addresses.

The format of the write data command (in a big-endian byte array) is shown in this table:

Table 8-26. Write data command format

Tag	Length	Parameter
Address		
Value/Mask		
[Address]		
[Value/Mask]		
...		
[Address]		
[Value/Mask]		

where:

```
Tag: a single-byte field set to 0xCC
Length: a two-byte field in a big-endian format, containing the length of the Write Data
Command (in bytes) including the header
Address: the target address to which the data must be written
Value/Mask: the data value (or bitmask) to be written to the preceding address
```

The parameter field is a single byte divided into the bitfields, as follows:

Table 8-27. Write data command parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

```
bytes: the width of the target locations in bytes (either 1, 2, or 4)
flags: control flags for the command behavior
Data Mask = bit 3: if set, only specific bits may be overwritten at the target address
(otherwise all bits may be overwritten)
Data Set = bit 4: if set, the bits at the target address are overwritten with this flag
(otherwise it is ignored)
```

One or more target address and value/bitmask pairs can be specified. The same bytes' and flags' parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

Table 8-28. Interpretation of write data command flags

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address |= val_msk	Set bitmask

NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values are larger or any of the bitmasks are wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within the allowed region, none of the values are written. The list of allowable blocks and target addresses for the chip are provided below.

Table 8-29. Valid DCD address ranges

Address range	Start address	Last address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B7FFF
IRAM free space	0x00907000	0x00917FF0
EIM memory	0x08000000	0x0FFEFFFF
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFFFFFF

8.6.2.2 Check data command

The check data command is used to test for a given 1-, 2-, or 4-byte bitmasks from a source address.

The check data command is a big-endian byte array with the format shown in this table:

Table 8-30. Check data command format

Tag	Length	Parameter
Address		
Mask		
[Count]		

where:

```
Tag: a single-byte field set to 0xCF
Length: a two-byte field in the big-endian format containing the length of the check data
command (in bytes) including the header
Address: the source address to test
Mask: the bit mask to test
Count: an optional poll count; If the count is not specified, this command polls
indefinitely
until the exit condition is met. If count = 0, this command behaves as for the NOP.
```

The parameter field is a single byte divided into bitfields, as follows:

Table 8-31. Check data command parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

```
bytes: the width of target locations in bytes (either 1, 2, or 4)
flags: control flags for the command behavior
Data Mask = bit 3: if set, only the specific bits may be overwritten at a target address
(otherwise all bits may be overwritten)
Data Set = bit 4: if set, the bits at the target address are overwritten with this flag
(otherwise it is ignored)
```

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

Table 8-32. Interpretation of check data command flags

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask)!= mask	Any bit clear
1	1	(*address & mask)!= 0	Any bit set

NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

8.6.2.3 NOP command

This command has no effect.

The format of the NOP command is a big-endian four-byte array, as shown in this table:

Table 8-33. NOP command format

Tag	Length	Undefined

where:

```
Tag: a single-byte field set to 0xC0
Length: a two-byte field in big endian containing the length of the NOP command in bytes
(fixed to a
value of 4)
Undefined: this byte is ignored and can be set to any value.
```

8.6.2.4 Unlock command

The unlock command is used to prevent specific engine features from being locked when exiting the ROM.

The format of the unlock command (in a big-endian byte array) is shown in this table:

Table 8-34. Unlock command format

Tag	Length	Eng
Value		
Value		
...		
Value		

where:

```
Tag: a single-byte field set to 0xB2
Eng: the engine to be left unlocked
Values: [optional] the unlock values required by the engine
```

NOTE

This command may not be used in the DCD structure if the SEC_CONFIG is configured as closed.

8.7 Plugin image

The ROM supports a limited number of boot devices. When using other devices as a boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) as a firmware to provide the missing boot drivers. Additionally, the plugin can be customized to support boot drivers, which is more flexible when performing the device initialization, such as condition judging, delay assertion, or to apply custom settings to the boot device and memory system.

In addition to the standard images, the chip also supports plugin images. The plugin images return the execution to the ROM whereas the standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see Boot data structure). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end, the plugin function must return with the program image parameters. (See High-level boot sequence for details about the boot flow).

The boot ROM authenticates the plugin image before running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32 *ivt_offset);

ARGUMENTS PASSED:

- start - the image load address on exit.
- bytes - the image size on exit.
- ivt_offset - the offset (in bytes) of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - success
- 0 - failure

8.8 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB serial connection.

In this mode, the ROM programs the WDOG1 for a 90-second time-out if the WDOG_ENABLE eFuse is 1 and continuously polls for the USB connection. If no activity is found on the USB OTG1 and the watchdog timer expires, the Arm core is reset.

NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB boot flow:

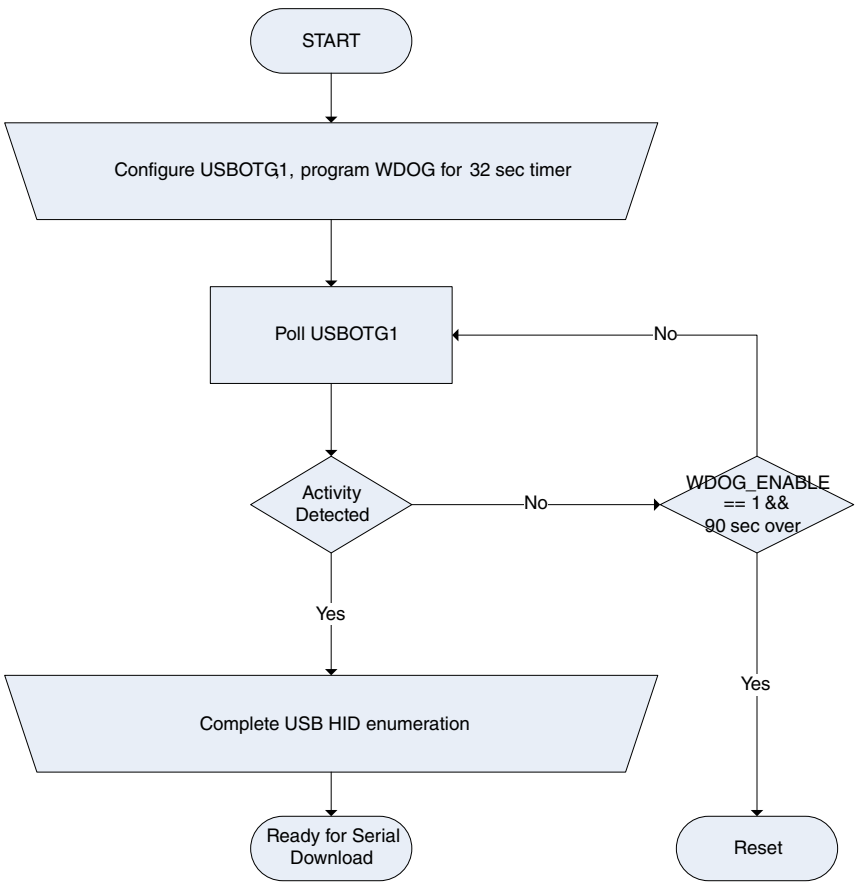

Figure 8-24. Serial Downloader boot flow

8.8.1 USB

The USB support is composed of the USBOH3 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of four HID reports are used to implement the SDP protocol for data transfers, as described in Table 8-35.

Table 8-35. USB HID reports

Report ID (first byte)	Transfer endpoint	Direction	Length	Description
1	control OUT	Host to device	17 B	SDP command from the host to the device.
2	control OUT	Host to device	Up to 1025 B	Data associated with the report 1 SDP command.
3	interrupt	Device to host	5 B	HAB security configuration. The device sends 0x12343412 in the closed mode and 0x56787856 in the open mode.
4	interrupt	Device to host	Up to 65 B	Data in response to the SDP command in report 1.

8.8.1.1 USB configuration details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for the USB device driver are listed in the following table.

Table 8-36. VID/PID and strings for USB device driver

Descriptor	Value
VID (NXP vendor ID)	0x15A2
PID[1]	0x61
String Descriptor1 (manufacturer)	NXP Semiconductors
String Descriptor2 (product)	S Blank RIGEL SE Blank RIGEL NS Blank RIGEL

Table continues on the next page...

Table 8-36. VID/PID and strings for USB device driver (continued)

Descriptor	Value
String Descriptor4	NXP Flash
String Descriptor5	NXP Flash

1. Allocation based on the BPN (Before Part Number)

8.8.1.2 IOMUX configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses the dedicated contacts on the IC. See the chip data sheet for details.

8.8.2 Serial Download Protocol (SDP)

The 16-byte SDP command from the host to device is sent using the HID report 1.

This table describes the 16-byte SDP command data structure:

Table 8-37. 16-byte SDP command data structure

BYTE offset	Size	Name	Description
0	2	COMMAND TYPE	These commands are supported for the ROM: • 0x0101 READ_REGISTER • 0x0202 WRITE_REGISTER • 0x0404 WRITE_FILE • 0x0505 ERROR_STATUS • 0x0A0A DCD_WRITE • 0x0B0B JUMP_ADDRESS
2	4	ADDRESS	Only relevant for these commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS. For the READ_REGISTER and WRITE_REGISTER commands, this field is the address to a register. For the WRITE_FILE and JUMP_ADDRESS commands, this field is an address to the internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for an 8-bit access, 0x10 for a 16-bit access, and 0x20 for a 32-bit access. Only relevant for the READ_REGISTER and WRITE_REGISTER commands.

Table continues on the next page...

Table 8-37. 16-byte SDP command data structure (continued)

BYTE offset	Size	Name	Description
7	4	DATA COUNT	Size of the data to read or write. Only relevant for the WRITE_FILE, READ_REGISTER, WRITE_REGISTER, and DCD_WRITE commands. For the WRITE_FILE and DCD_WRITE commands, the DATA COUNT is in the byte units.
11	4	DATA	The value to write. Only relevant for the WRITE_REGISTER command.
15	1	RESERVED	Reserved

8.8.2.1 SDP commands

The SDP commands are described in the following sections.

8.8.2.1.1 READ_REGISTER

The transaction for the READ_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration, and Report4 for the response or the register value.

The register to read is specified in the ADDRESS field of the SDP command. The first device sends Report3 with the security configuration followed by the Report4 with the bytes read at a given address. If the count is greater than 64, multiple reports with the report id 4 are sent until the entire data requested by the host is sent. The STATUS is either 0x12343412 for the closed parts and 0x56787856 for the open or field return parts.

Report1, Command, Host to Device:

1	Valid values for the READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT

ID 16-byte SDP command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register value

ID 4 bytes of data containing the register value. If the number of bytes requested is less than 4, the remaining bytes must be ignored by the host.

Multiple reports of the report id 4 are sent until the entire requested data is sent.

Report4, Response, Device to Host: last response report

4	Register value

ID 64 bytes of data containing the register value. If the number of bytes requested is less than 64, the remaining bytes must be ignored by the host.

8.8.2.1.2 WRITE_REGISTER

The transaction for the WRITE_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration and Report4 for the write status.

The host sends Report1 with the WRITE_REGISTER command. The register to write is specified in the ADDRESS field of the SDP command of Report1, with the FORMAT field set to the data type (number of bits to write, either 8, 16, or 32) and the value to write in the DATA field of the SDP command. The device writes the DATA to the register address and returns the WRITE_COMPLETE code using Report4 and the security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA

ID 16-byte SDP command

Report3, Response, Device to Host:

3	4 bytes indicating the security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status

ID 64 bytes data with the first 4 bytes to indicate that the write is completed with code 0x128A8A12. On failure, the device reports the HAB error status.

8.8.2.1.3 WRITE_FILE

The transaction for the WRITE_FILE command consists of these reports: Report1 for the command phase, Report2 for the data phase, Report3 for the HAB mode, and Report4 to indicate that the data are received in full.

The size of each Report2 is limited to 1024 bytes (limitation of the USB HID protocol). Hence, multiple Report2 packets are sent by the host in the data phase until the entire data is transferred to the device. When the entire data (DATA_COUNT bytes) is received, the device sends Report3 with the HAB mode and Report4 with 0x88888888, indicating that the file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT

ID 16-byte SDP command

==========Optional Begin==========

Host sends the ERROR_STATUS command to query if the HAB rejected the address

========== Optional End==========

Report2, Host to Device:

2	File data

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status

ID 64 bytes data with the first four bytes to indicate that the file download completed with code 0x88888888. On failure, the device reports the HAB error status.

8.8.2.1.4 ERROR_STATUS

The transaction for the SDP command ERROR_STATUS consists of three reports.

Report1 is used by the host to send the command; the device sends global error status in four bytes of Report4 after returning the security configuration in Report3. When the device receives the ERROR_STATUS command, it returns the global error status that is updated for each command. This command is useful to find out whether the last command resulted in a device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	Four bytes Error status

ID first 4 bytes status in 64 bytes Report4

8.8.2.1.5 DCD_WRITE

The SDP command DCD_WRITE is used by the host to send multiple register writes in one shot. This command is provided to speed up the process of programming the register writes (such as to configure an external RAM device).

The command goes with Report1 from the host with COMMAND TYPE set to DCD_WRITE, ADDRESS which is used as a temporary location of the DCD data, and DATA_COUNT to the number of bytes sent in the data out phase. In the data phase, the

host sends the data for a number of registers using Report2. The device completes the transaction with Report3 indicating the security configuration and Report4 with the WRITE_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT

ID 16-byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status

ID 64 bytes report with the first four bytes to indicate that the write completed with the code 0x128A8A12. On failure, the device reports the HAB error status.

See Device Configuration Data (DCD) for the DCD format description.

8.8.2.1.6 JUMP_ADDRESS

The SDP command JUMP_ADDRESS is the last command that the host can send to the device. After this command, the device jumps to the address specified in the ADDRESS field of the SDP command and starts to execute.

This command usually follows after the WRITE_FILE command. The command is sent by the host in the command-phase of the transaction using Report1. There is no data phase for this command, but the device sends the status Report3 to complete the transaction. If the authentication fails, it also sends Report4 with the HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration

ID 4 bytes status

This report is sent by the device only in case of an error jumping to the given address, or if the device reports error in Report4, Response, Device to Host:

4	Four bytes HAB error status

ID 4 bytes status, 64 bytes report length

8.9 Recovery devices

The chip supports recovery devices. If the primary boot device fails, the boot ROM tries to boot from the recovery device using one of the I^2C or ECSPI ports.

To enable the recovery device, the BOOT_CFG4[6] fuse must be set. Additionally, the serial EEPROM fuses must be set as described in Serial ROM through SPI and I^2C.

8.10 USB low-power boot

The ROM supports the USB low-power boot. This feature enables a device with a dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter if the upstream port is a USB charger or a USB host/hub.

If a USB dedicated charger or a host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (max.1.5 A) can be supplied by the charger. If a USB host/hub is connected, a maximal current of 100 mA is supplied to the device and the device is able to power up to boot the image with less than 100 mA.

If the LPB_BOOT fuses are blown, the chip checks if there is a low-power condition via the GPIO_3 pad. If there is a low-power boot condition, the USB charger detection is activated. If there is no USB charger, the ROM initializes the USB as a device and applies division factors on the Arm, DDR, AXI, and AHB root clocks based on the

LPB_BOOT fuses value (see the table below). The polarity of the low-power boot condition on the GPIO_3 pad is set by the BT _LPB_POLARITY fuse (see the following figure).

Table 8-38. USB low-power boot frequencies

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
00	ARM_CLK_ROOT=792 MHz MMDC_CH0_AXI_CLK_ROOT=528 MHz MMDC_CH1_AXI_CLK_ROOT=528 MHz AXI_CLK_ROOT=264 MHz AHB_CLK_ROOT=132 MHz	ARM_CLK_ROOT=396 MHz MMDC_CH0_AXI_CLK_ROOT=352 MHz MMDC_CH1_AXI_CLK_ROOT=352 MHz AXI_CLK_ROOT=176 MHz AHB_CLK_ROOT=88 MHz
01	ARM_CLK_ROOT=792 MHz MMDC_CH0_AXI_CLK_ROOT=528 MHz MMDC_CH1_AXI_CLK_ROOT=528 MHz AXI_CLK_ROOT=264 MHz AHB_CLK_ROOT=132 MHz	ARM_CLK_ROOT=396 MHz MMDC_CH0_AXI_CLK_ROOT=352 MHz MMDC_CH1_AXI_CLK_ROOT=352 MHz AXI_CLK_ROOT=176 MHz AHB_CLK_ROOT=88 MHz
10	ARM_CLK_ROOT=396 MHz MMDC_CH0_AXI_CLK_ROOT=264 MHz MMDC_CH1_AXI_CLK_ROOT=264 MHz AXI_CLK_ROOT=132 MHz AHB_CLK_ROOT=66 MHz	ARM_CLK_ROOT=264 MHz MMDC_CH0_AXI_CLK_ROOT=176 MHz MMDC_CH1_AXI_CLK_ROOT=176 MHz AXI_CLK_ROOT=88 MHz AHB_CLK_ROOT=44 MHz
11	ARM_CLK_ROOT=264 MHz MMDC_CH0_AXI_CLK_ROOT=132 MHz MMDC_CH1_AXI_CLK_ROOT=132 MHz AXI_CLK_ROOT=66 MHz AHB_CLK_ROOT=66 MHz	ARM_CLK_ROOT=132 MHz MMDC_CH0_AXI_CLK_ROOT=88 MHz MMDC_CH1_AXI_CLK_ROOT=88 MHz AXI_CLK_ROOT=44 MHz AHB_CLK_ROOT=44 MHz

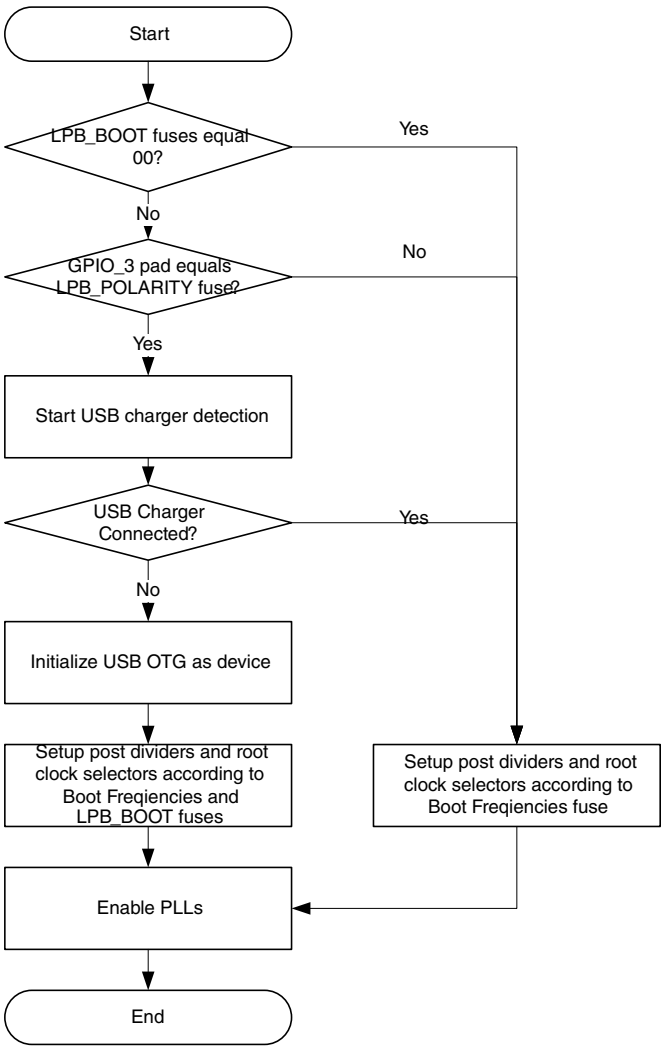

Figure 8-25. USB low-power boot flow

8.11 SD/MMC manufacture mode

When the internal boot and recover boot (if enabled) failed, the boot goes to the SD/MMC manufacture mode before the serial download mode. In the manufacture mode, one bit bus width is used despite of the fuse setting.

In the manufacture mode, the SD or MMC card will be scanned on the uSDHC1 and uSDHC2. If a card is detected and a valid boot image is found in the card, the boot image is loaded and executed. Pad of SD1_CD and SD2_CD are used to detect whether a card is inserted or not.

By default, the SD/MMC manufacture mode is enabled. Blow the fuse of the DISABLE_SDMMC_MFG to disable it.

NOTE

A secondary boot is not supported in the SD/MMC manufacture mode.

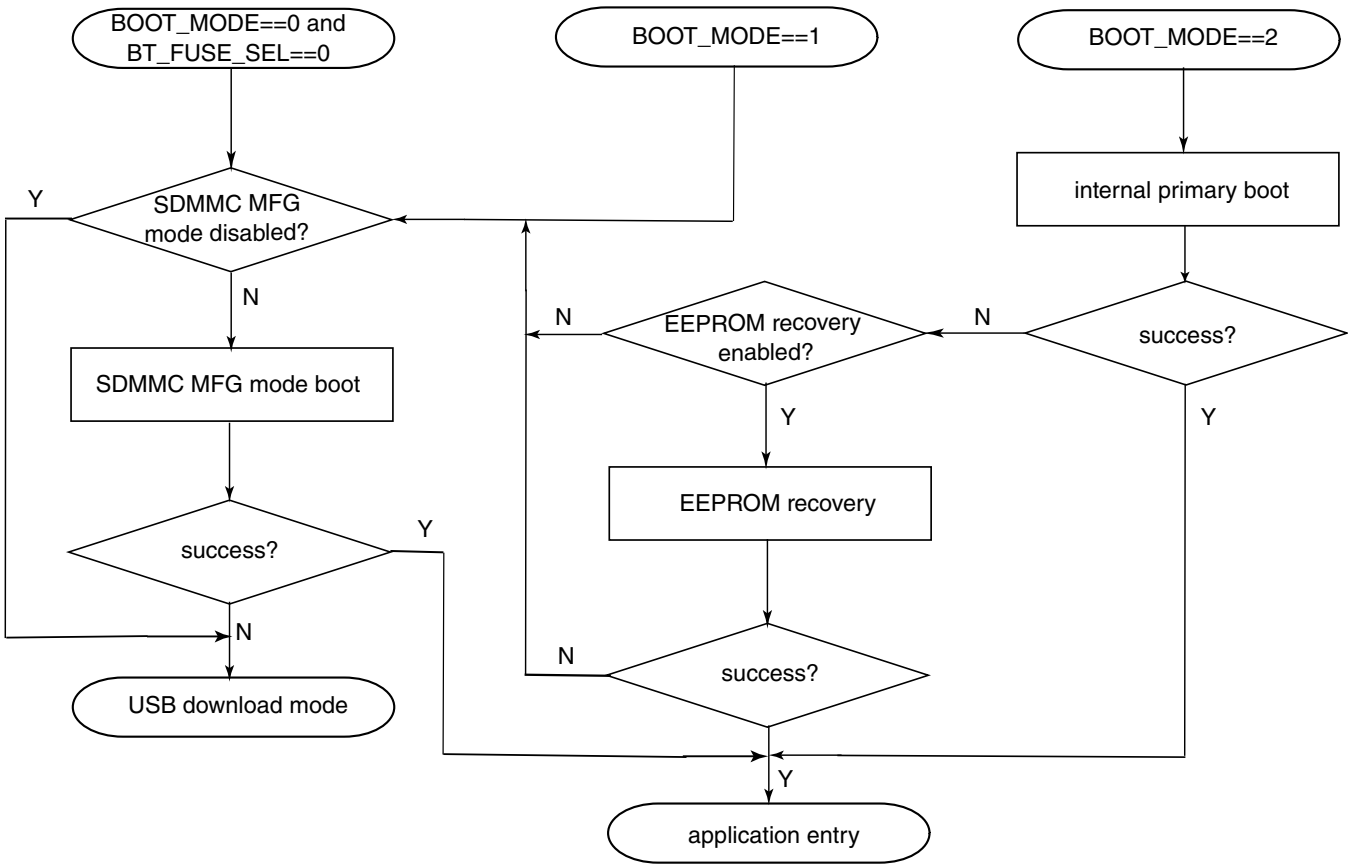

Figure 8-26. SD/MMC manufacture boot flow

8.11.1 Using manufacture mode / serial download mode with eMMC

Manufacture mode is intended to allow a system to boot from a SD/MMC card on a board with unprogrammed boot media or to upgrade the image on a boot device. For manufacture mode, the boot ROM assumes if there is a SD/MMC card present indicated by the uSDHC card detect (CD) signal pulled low, then there is a valid image on the card.

If an unprogrammed eMMC device is connected to the uSDHC port(s) on which manufacture mode is supported and the CD signal is low, the ROM will attempt manufacturing mode with the eMMC device, which does not contain a valid image. The ROM loads the invalid image, and this will cause the ROM code to fail to enter serial

download mode, resulting in a reset of the system by the ROM. To enter serial download mode in this case, the CD pin should be pulled up so the ROM does not detect a eMMC device present and will bypass the manufacture mode to enter serial download mode.

8.12 High-Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying the areas of code or data in the programmable memory to make it behave in an incorrect manner. The HAB also prevents the attempts to gain access to features which must not be available.

The integration of the HAB feature with the ROM code ensures that the chip does not enter an operational state if the existing hardware security blocks detected a condition that may be a security threat or if the areas of memory deemed to be important were modified. The HAB uses the RSA digital signatures to enforce these policies.

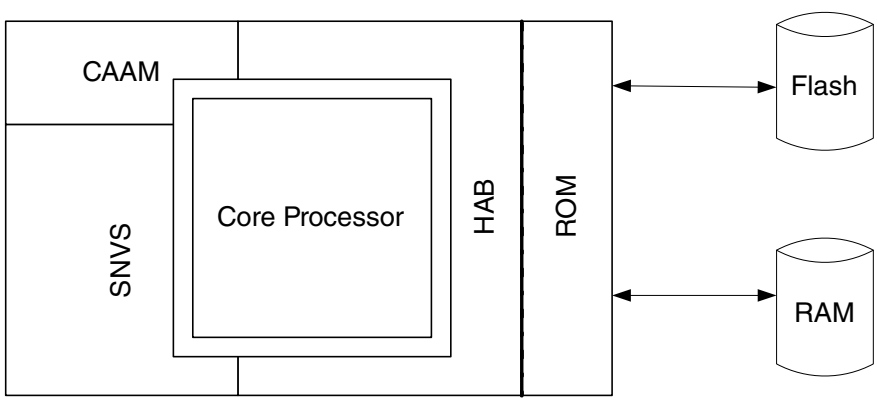

Figure 8-27. Secure boot components

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to make sure that the system security state is as expected. The HAB also uses the CAAM hardware block to accelerate the SHA-256 message digest operations performed during the signature verifications and AES-128 operations for the encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator can't be used. The RSA key sizes supported are 1024, 2048, and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by the HAB are:

- X.509 public key certificate support
- CMS signature format support
- Proprietary encrypted boot support. Note that the encrypted boot depends on the CAAM hardware module. When the CAAM is disabled (when the EXPORT_CONTROL fuse is blown), the encrypted boot is not available.

NOTE

NXP provides the reference Code Signing Tool (CST) for key generation, certificate generation, and code signing for use with the HAB library. The CST can be found by searching for "IMX_CST_TOOL" at http://www.nxp.com.

NOTE

For further details on using the secure boot feature using HAB, refer to *Secure Boot on i.MX 50, i.MX 53, i.MX 6 and i.MX 7 Series using HABv4 (AN4581)*.

8.12.1 HAB API vector table addresses

For devices that perform a secure boot, the HAB library may be called by the boot stages that execute after the ROM code.

The RVT table contains the pointers to the HAB API functions. The address of the RVT table is shown in the following table.

Table 8-39. RVT table addresses

	HAB API vector table address	ROM API vector table address
Silicon revisions prior to 1.2	0x00000094	0x000000C0
Silicon revision 1.2 and later	0x00000098	0x000000C4

NOTE

For additional information on the secure boot including the HAB API, refer to *HABv4 RVT Guidelines and Recommendations (AN12263)*.

Chapter 9
Multimedia

9.1 Video Graphics Sub System

The chip video graphics subsystem consists of the dedicated modules found here.

- Video Processing Unit (VPU): a multi-standard high performance video/image CODEC
- Two Graphics Processing Units (GPUs):
  - 3D GPU: accelerating the generation of 3D graphics (OpenGL/ES)
  - 2D GPU: acceleration the generation of 2D graphics (BitBLT).
- One Image Processing Unit (IPU): providing connectivity to cameras and displays, related processing, synchronization and control.
- Display interface bridges: providing optional translation from the digital display interface supported by the IPU to other interfaces:
  - LVDS bridge (LDB): providing up to one LVDS interface
  - HDMI transmitter
  - MIPI/DSI transmitter
- MIPI/CSI-2 receiver
- Two (identical) Display Content Integrity Checker (DCIC) are used to authenticate sensitive displayed data.
- A Video Data Order Adapter (VDOA): used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

High level integration scheme of the i.MX 6Solo/6DualLite video/graphics system is provided by the figure below.

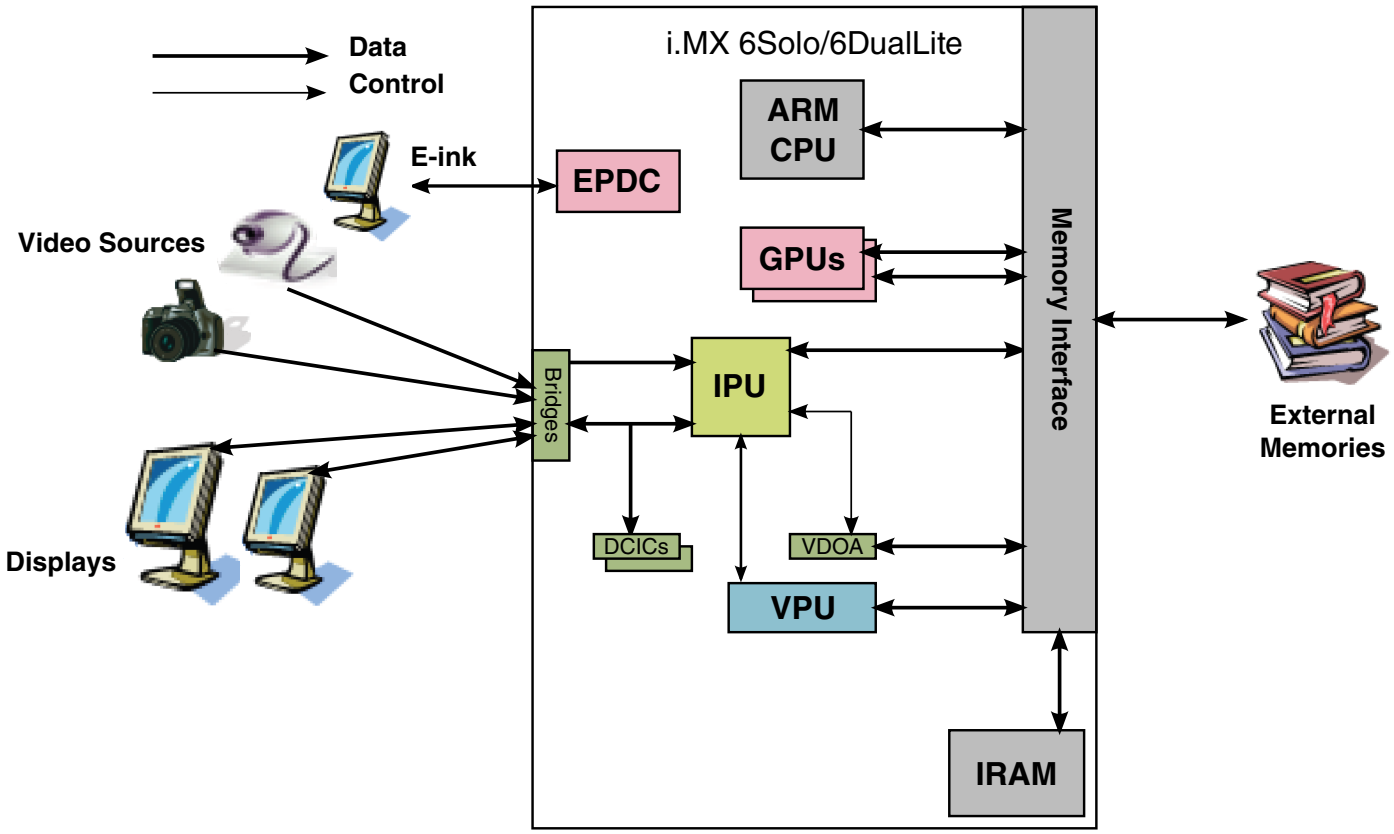

Figure 9-1. i.MX 6Solo/6DualLite Video-Graphics Subsystem

9.1.1 Display outputs

The i.MX 6Solo/6DualLite implements a robust muxing logic on the two display ports (2x per IPU), to the external interfaces, either direct, or via bridges (MIPI, LVDS, HDMI), per description below:

- Two parallel - driven directly by IPU; pixel clock at least up to 200 MHz (for external load of up to 10 pF).
  - Parallel interface works up to 200 MHz
  - HDMI interface works up to 270 MHz
- Two LVDS channels, driven by the LDB; pixel clock up to 170 MHz.
- One HDMI port (ver. 1.4) - driven by the HDMI transmitter: pixel clock up to 270 MHz (gated by the IPU capabilities)
- One MIPI/DSI port - driven by the MIPI/DSI transmitter; 2 data lanes at 1 GHz
- IPU display port (DI) can be connected to each of the above ports

- IPU has 2 display ports, up to two external ports can be active at any given time. (Additional asynchronous data flows can be sent though the parallel ports and the MIPI/DSI port.)
- Read access is supported as follows
  - For the Parallel0 port: through DI0
  - For the Parallel1 port: through DI1

- Inputs to either of the DCICs are taken from one of the following buses
  - For each of the parallel interfaces: probing the I/O loopback (essentially equivalent to probing the external wires).
  - For other integrated interfaces (e.g. LVDS): probing the DI1 output of the IPU (essentially equivalent to the inputs to the serializers)
  - For the data enable signal, two control signals are probed from each of the above buses.

The i.MX 6Solo/6DualLite also implements a EPDC for E-ink display.

For visual view of display signal routing, see the following figure. The chip MUX select signals are driven by configuration bits as specified in the IOMUX controller (IOMUXC) chapter in the IOMUXC_IOMUXC_GPR registers description fields.

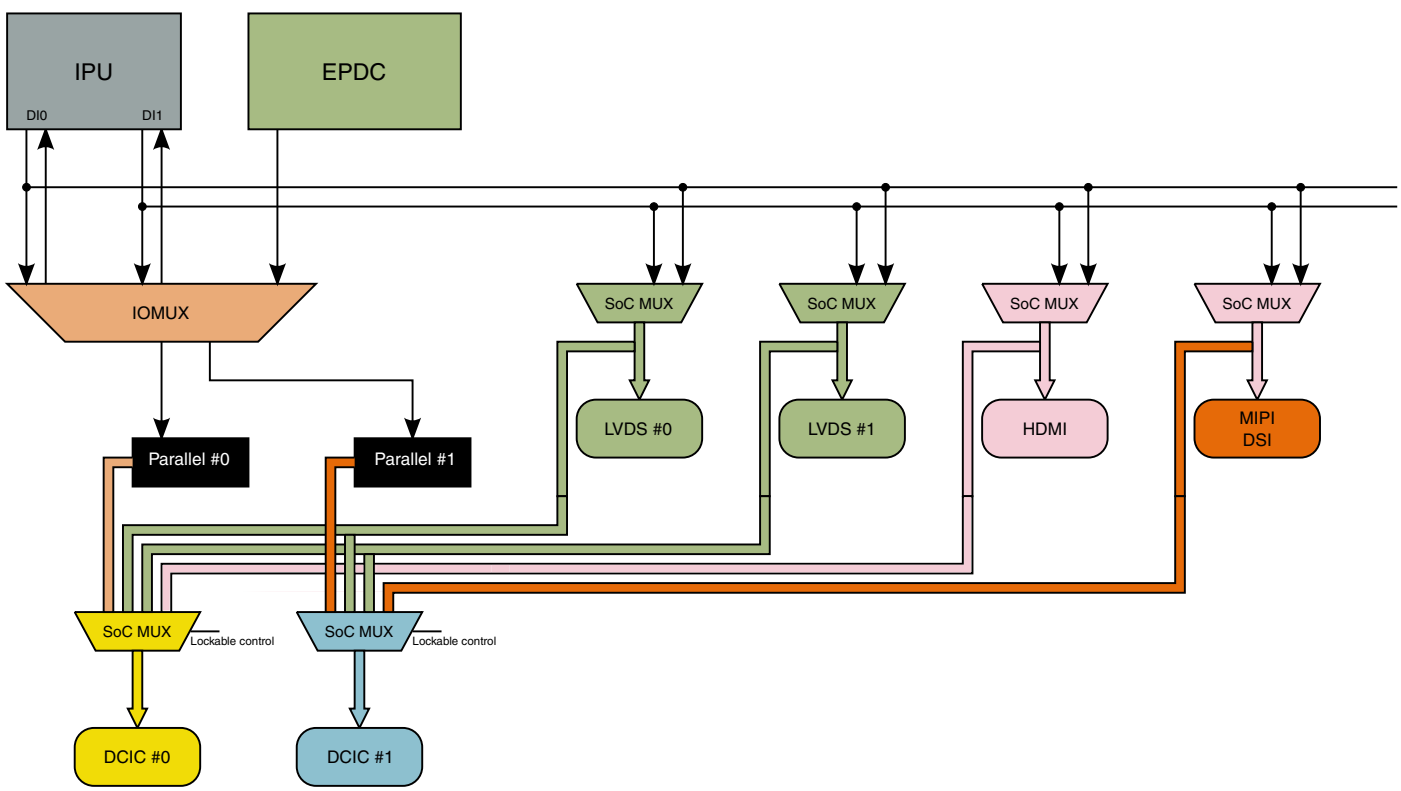

Figure 9-2. Display port muxing scheme

9.1.2 Video input

There are 2 video input ports (e.g. from image sensors)

See the figure below for details.

Video Input Ports Connectivity

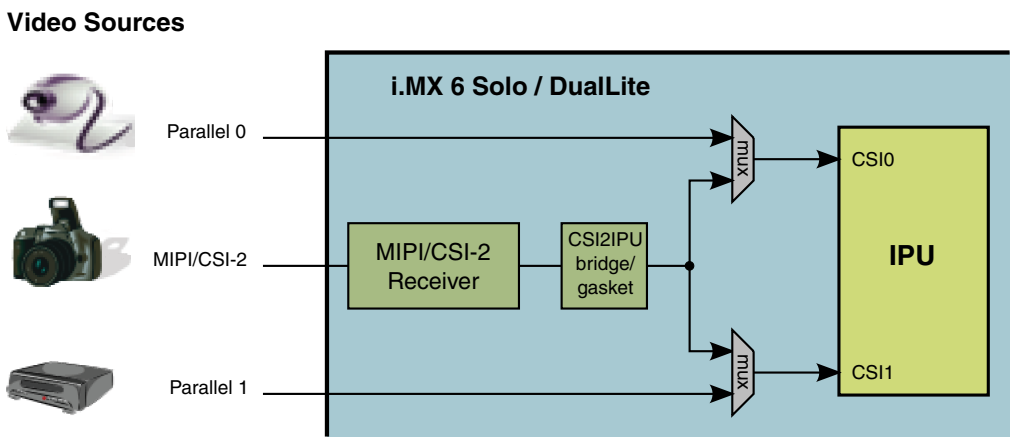

Figure 9-3. The Video Input Ports

One parallel port is connected directly to an IPU input port.

One MIPI/CSI-2 port- IPU receives two components per cycle from the MIPI_CSI2 interface. The maximum bandwidth of the interface is as follows:

- 250MByte/sec for 2 data lanes configuration (1000Mbps/lane)
- 125Mbyte/sec for 1 data lanes configuration (1000Mbps/lane)

IPU has two input ports, CSI0 and CSI1, which can receive data concurrently and independently. At any given time, an IPU input port may receive data either from a parallel external port or from the MIPI/CSI-2 receiver.

The MIPI/CSI-2 port can receive up to 4 concurrent data channels. Each data channel can be routed by one of the two CSI ports of the IPU. Pixel data can be further processed by the IPU. Other data types can be transferred through a CSI transparently as generic data to the system memory.

The IPU, VPU, VDOA and the GPUs have master AXI ports, providing access to system memory.

The modules are controlled (by the ARM CPU or the SDMA) as follows:

- The LDB is controlled by signals connected to top-level registers.
- All other modules have a host interface. For the VPU, VDOA and the DCIC's, this is a slave IP port and for the MIPI bridges, GPUs, and IPUs, this is a slave AHB port.
- The data flow between VPU, VDOA, GPUs and IPU is through system memory and it is normally controlled by the CPU. For spacial situations, a direct synchronization interface is provided:
  - An interface between the IPU and VPU, for low-latency video record.
  - An interface between the VDOA and IPU, for tight pipelining of data from the VDOA to the IPU, through the IRAM.

9.1.3 Synchronization Mechanisms

The i.MX 6Solo/6DualLite provides HW synchronization mechanism between IPU and VPU and between IPU and VDOA to reduce core intervention and enable lock-step operation.

9.1.4 Supported applications

The system described above supports a wide variety of video/graphics applications. The following table describes the main applications.

Table 9-1. Video/graphics applications

Application	Features
Display management	
Screen refresh	Up to two displays active simultaneously Pixel clock rate: • Single display - up to 270 MHz • Two displays (the sum of the two rates) - up to 270 MHz **NOTE:** The parallel interface works up to 200 MHz, and the HDMI interface works up to 270 MHz. Special features: • On-the-fly image conversion: rotation, inversion, resizing, color-space conversion and combining • On-the-fly image quality enhancement: color adjustment (including special effects) and gamut mapping, gamma correction and contrast stretching • Low-light compensation, allowing back-light reduction • Scrolling/panning
Updating the display buffer (from a background buffer)	Buffer either in system memory or in an external display controller (accessed through the display port) Special features:

Table continues on the next page...

Table 9-1. Video/graphics applications (continued)

Application	Features
	• On-the-fly processing - as for screen refresh • Optimized update - only modified parts are transferred • Synchronization with screen refresh, to prevent tearing • Scrolling (e.g. a running banner or a short animation)
Video	
Camera preview (displaying a view-finder window)	Input rate (from sensor): up to 270 MHz Additional features: • Window-of-interest • On-the-fly image conversion: de-interlacing, resizing, color space conversion, rotation, inversion • Combining with graphics • Synchronization, to prevent tearing
Still image capture	Rate: • Burst mode (off-line processing): up to 180 Mpixels/sec (while still leaving headroom for up to 35% blanking overhead) • Continuous: up to 160 Mpixels/sec Additional features: • Image quality enlacement before compression - as for camera preview • Image conversion before compression - as for camera preview; with independent parameters • Synchronization with a flash, a mechanical shutter and a mechanical iris
Motion Video Record	Resolution and rate: up to 1080p (1920x1080 at 60 fps in unit test without multimedia framework) Image processing before compression - as for still image capture
Motion Video Playback	Resolution and rate - up to 1080i/p (1920x1080) at 60 fps in unit test (without multimedia framework) Additional features: • Post-filtering: de-blocking and de-ringing • Image conversion after decompression: de-interlacing, rotation, inversion, resizing, color-space conversion and combining • Quality enhancement: color adjustment (including special effects) and gamut mapping, gamma correction and contrast stretching
Two-Way Video	Resolution and rate - up to 1080p (1920x1080) at 30 fps in unit test (without multimedia framework) Record and playback features - as above Various display options, including: • Two non-overlapping windows • Picture-in-picture

The following figure provides the sample processing flow of multimedia application.

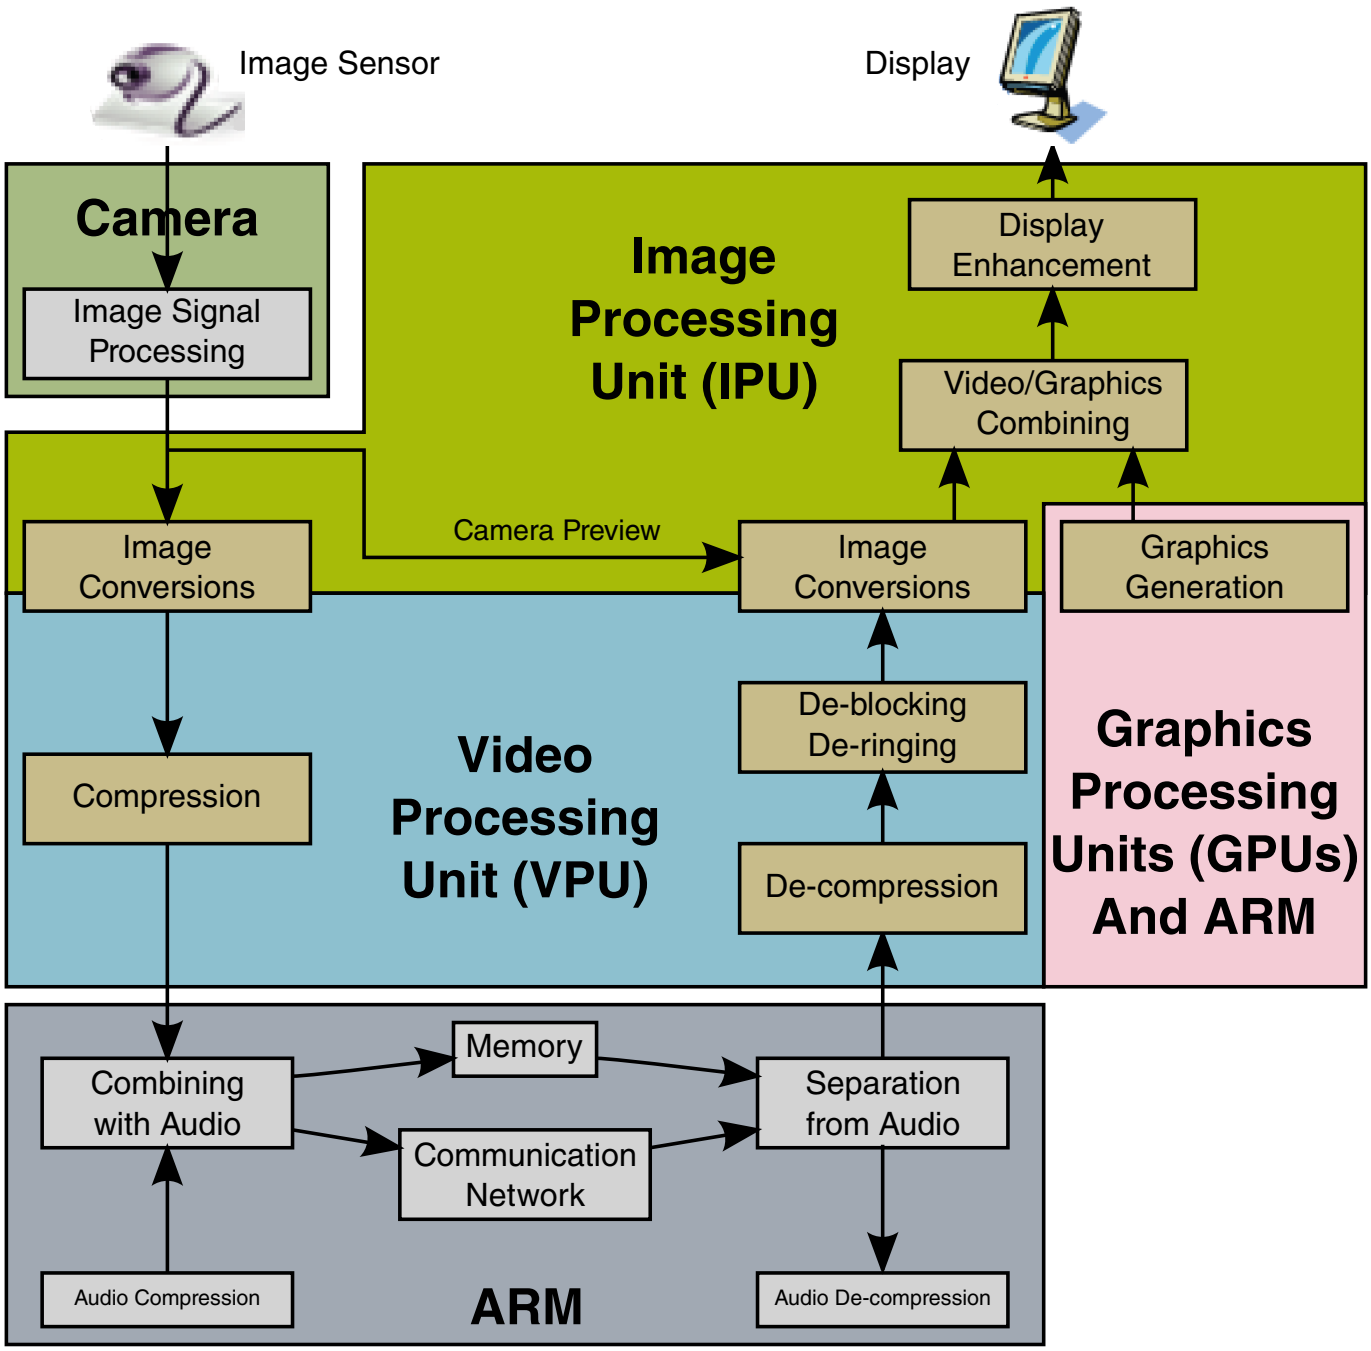

Figure 9-4. Processing flow for multimedia applications

- The camera preview mode-the upper part
- Video recording-the left part
- Video playback-the right part
- A video call-both sides

9.2 Image Processing Unit (IPU)

The following table shows the IPU IP parametric table.

Table 9-2. IPU IP Parametric Table

Name	IPU
Function	Connectivity to cameras and displays; related processing; synchronization and control
External I/O Pins Notes: This is the pinout of the IPU module At chip level, some of the pins are muxed and some are omitted. Additional GPIO pins are required to construct the connection. This is not included in this list.	Parallel Display port: 32 bit data, ~18 clocks and controls. Regular CMOS IO type, 198 MHz max. May be also connected to internal connectivity bridges. Slow Serial Display port: 2 bit data, 3 clocks and controls. Regular CMOS IO type, 120 MHz max. Parallel Sensor port: 20 bit data inputs, 5-6 clocks and controls. Regular CMOS IO type, MHz max. Camera strobe port: 6 camera control outputs. Regular CMOS IO type, 120 MHz max.
SoC Buses	AXI master - for accessing the memory AHB slave - for programming, control and direct access of the MCU to the display
Interrupts	Two interrupts: functional and error
DMA Requests	Includes an integral DMA controller with an AXI master port Also one DMA request to the SDMA
Number of instantiations	1
Clock sources and range	HSP_CLK - Internal high-speed processing clock: up to 270 MHz DI_CLK0, DI_CLK1 - Display interface clocks: up to 270 MHz

The goal of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices - cameras, displays, graphics coprocessors, TV encoders and decoders.

- Related image processing and manipulation: image enhancements and conversions, etc.
- Synchronization and control capabilities (to avoid tearing artifacts, for example)

This integrative approach leads to several significant advantages:

- Automation: The involvement of the MCU (Main Control Unit) in image management is minimized. In particular, display refresh/update and a camera preview (displaying the input from an image sensor) can be performed completely autonomously. The resulting benefits are reducing the overhead due to SW-HW synchronization, freeing the MCU to perform other tasks and reduced power consumption (when the MCU is idle and can be powered down).
- Optimal data path: Access to system memory is minimized. In particular, significant processing can be performed on-the-fly while receiving data from an image sensor and/or sending data to a display. System memory is used essentially only when a change in pixel order or frame rate is needed. The resulting benefits are reduced load on the system bus and further reduction of power consumption.
- Resource sharing: Maximal HW reuse for different applications, resulting with the support of a wide range of requirements with minimal hardware

The hardware reuse mentioned above is enabled by a sophisticated configurability of each hardware block. This configurability also allows the support of a wide range of external devices, data formats and operation modes.

A simplified block diagram of the IPU is given in the figure below. The role of each block is described in the table below.

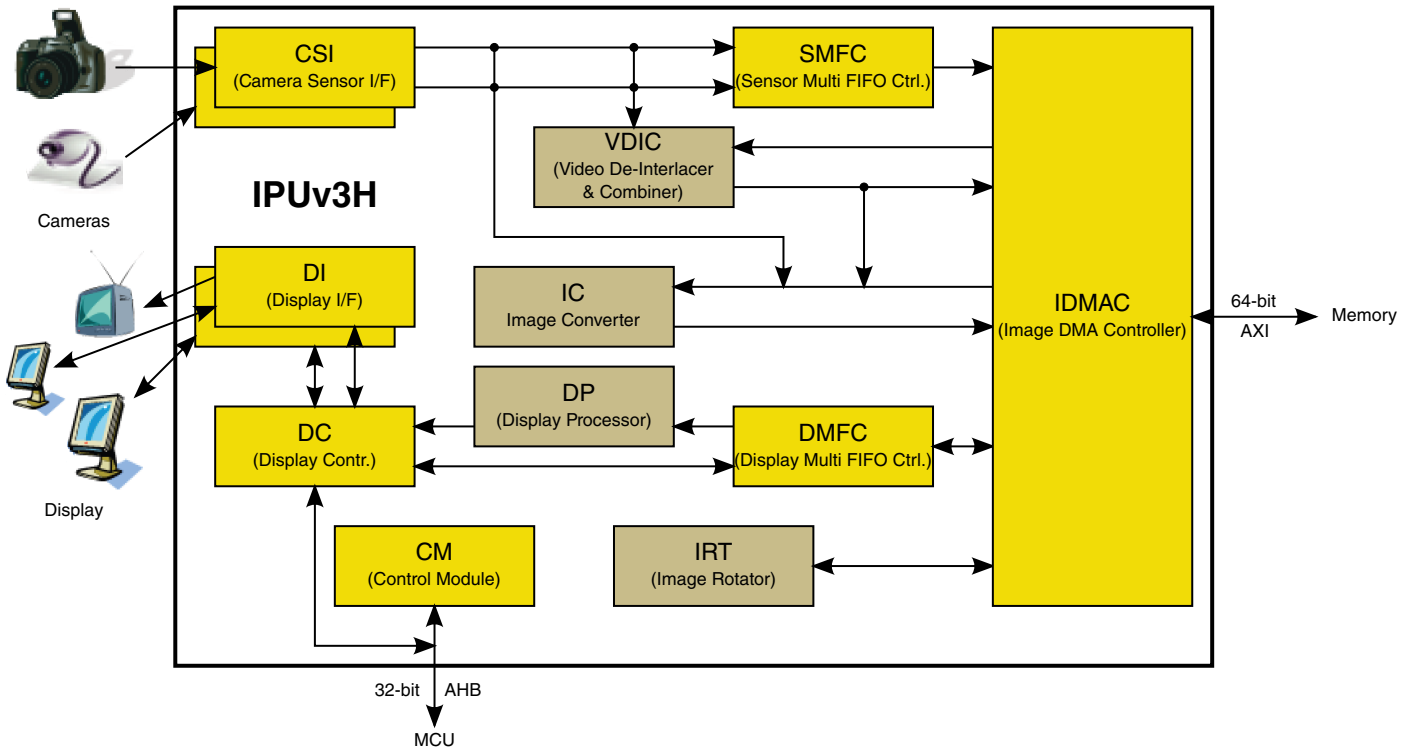

Figure 9-5. IPU - Block Diagram

Table 9-3. IPU - Block Description

Block	Description
CSI - Camera Sensor Interface	Controls a camera port; provides interface to an image sensor or a related device. IPUv3 includes 2 such blocks
DI - Display Interface	Provides interface to displays, display controllers and related devices. IPUv3 includes 2 such blocks
DC - Display Controller	Controls the display ports.
VDIC - Video De-Interlacer and Combiner	Performs de-interlacing - converting interlaced video to progressive - or combining
IC - Image Converter	Performs resizing, color conversion/correction, combining with graphics, and horizontal inversion
DP - Display Processor	Performs the processing required for data sent to display
IRT - Image Rotator	Performs rotation (90 or 180 degrees) and inversion (vertical/horizontal)
IDMAC - Image DMA Controller	Controls the memory port; transfers data to/from system memory
SMFC - Sensor Multi FIFO Controller	Controls FIFO's for output from the CSI's to system memory
DMFC - Display Multi FIFO Controller	Controls FIFO's for IDMAC channels related to the display system
CM - Control Module	Provides control and synchronization.

9.2.1 IPU External Ports

The IPU has the following ports:

- Two camera ports - controlled by a CSI module - providing a connection to image sensors and related devices.
- Two display ports - each controlled by a DI module - providing a connection to displays and related devices.
- Memory port - AXI (AHB V3.0) master, controlled by the IDMAC - providing connection to the system memory.
- AHB-lite slave port, providing connection to the ARM MCU (and to any other master connected to the ARM's cross-bar switch)

9.2.1.1 Camera Ports

The role of these ports is to receive input from video sources (e.g. image sensors) and to provide support for time-sensitive control signals to the camera. (Non-time-sensitive controls - e.g. configuration, reset - are performed by the MCU, through an I2C I/F or GPIO signals).

Each of the camera ports includes the following features:

- Direct connectivity to most relevant external devices.
- Parallel interface - up to 20-bit data bus
- Frame size: up to 8192 x 4096 pixels (including blanking intervals)
- Data formats supported include Raw (Bayer), RGB, YUV 4:4:4, YUV 4:2:2 and grayscale, up to 16 bits per value (component).
- Synchronization - video mode
  - The sensor is the master of the pixel clock (PIXCLK) and synchronization signals
  - Synchronization signals are received using either of the following methods:
    - Dedicated control signals -VSYNC, HSYNC - with programmable pulse width and polarity
    - Controls embedded in the data stream, following loosely the BT.656 protocol, with flexibility in code values and location.
- Synchronization - still image capture
  - The image capture is triggered by the MCU or by an external signal (e.g. a mechanical shutter)
  - Synchronized strobes are generated for up to 6 outputs - the sensor and camera peripherals (flash, mechanical shutter...)
- Additional features
  - Frame rate reduction, by periodic skipping of frames

- Downsizing x2, by skipping rows/columns
- Window-of-interest selection
- Pre-flash - for red-eye reduction and for measurements (e.g. focus) in low-light conditions

Several sensors can be connected to each of the CSI's. Simultaneous functionality (sending data) is supported as follows:

- Two streams can be received independently, each through a different CSI.
- Only one of the streams can be transferred to the VDIC or IC for on-the-fly processing, while the other one sent directly to system memory.

The input rate supported by the camera port is as follows:

- Peak: up to 240 MHz (values/sec)
- Average (assuming 35% blanking overhead), for YUV 4:2:2
  - Pixel in one cycle (e.g. BT.1120): up to 180 MP/sec, e.g. 12M pixels @ 15 fps
  - Pixel on two cycles (e.g. BT.656): up to 90 MP/sec, e.g. 6M pixels @ 15 fps.
- On-the-fly processing may be restricted to a lower input rate - see below.

9.2.1.2 Display Ports

The role of these ports is to communicate with display devices, either directly or through a controller (e.g. graphics accelerator) or a bridge (e.g. TV encoder or an LVDS interface bridge).

9.2.1.2.1 Access Modes

Two access modes are supported:

- Synchronous Access
- Asynchronous Access

9.2.1.2.2 Synchronous Access

In this mode, the IPU transfers a two-dimensional block of pixels to the display device, in synchronization with the screen refresh cycle.

This mode has a dual role:

- For a RAM-less display or a TV screen, this mode is used to perform the screen refresh process from a display buffer in system memory.
- For a "smart" display, this mode is used to transfer a rectangular block of pixels to the display's screen and, in some cases, also to the display buffer

In both cases, the IPU sends to the display all the synchronization signals controlling the screen refresh and the block transfer is synchronized with these signals. This synchronization means that tearing effects are avoided when using this mode.

9.2.1.2.3 Asynchronous Access

This is the main mode used for communicating with an external display controller (possibly in a smart display or a graphics accelerator). In this mode, the IPU performs random access - read/write - to the memory and registers of the controller.

The following access types are provided:

- Data transfer to the external device, after on-the-fly processing in the IPU.
- Data transfer (DMA) - read/write - between the host's system memory and the external device, through the IPU's memory port (controlled by the IDMAC); e.g. transfer of a rectangular block of pixels (possibly full screen).
- Host access - read/write - to an external device, through the AHB-slave port

9.2.1.2.4 Interface details

The display interface is very flexible and supports a wide variety of devices from major manufacturers.

The following interface types are provided (in each of the two display ports):

- A parallel video interface (for synchronous access) - up to 24-bit data bus.
  - Supports BT.656 (8-bit) and BT.1120 (16-bit) protocols
  - Supports HDTV standards SMPTE274 (1080i/p) and SMPTE296 (720p)
- A parallel bidirectional bus interface (for asynchronous access) - up to 32-bit data bus.
- A serial interface - 3-wire, 4-wire and 5-wire (two flavors) (for asynchronous access)

The supported formats for pixel data are: RGB and YUV 4:2:2.

For the interface clock, there are the following options (independently for each port)

- Derived from the IPU internal clock (master mode)
- Provided by an external source (slave mode)

The transfer rate supported

- When a single port is active, the pixel clock rate is up to 198 MHz
- When both ports are active
  - Each pixel clock rate may be up to MHz[1]
  - The sum of pixel clock rates is up to MHz

9.2.1.2.5 Connecting To Display Devices

IPU allows the connectivity to multiple display devices.

In particular, it supports the following setup:

- Primary LCD display.
- Second LCD display.
- External display; e.g. TV.

Simultaneous functionality of the above devices is possible in each of the following ways:

- Two devices can be accessed (synchronously or asynchronously) independently, each through a different port: each using any of the available interfaces.
- Two devices can time-share asynchronous accesses through the legacy serial and parallel interfaces, using the CS signals.

9.2.2 Processing

The IPU processes rectangular blocks of pixels. The processing is performed in four modules - VDIC, IC, DP and IRT.

(see Figure 9-5 and Table 9-3). Several time-shared data flows are supported, as described in the following table.

Table 9-4. Time-Shared Data Flows Through The IPU

Name	Number	Type	Flow	Target	Restrictions
Display Refresh/ Update	5 flows (at most two of them of type DS1)	DS1	Fmem -> DP -> Display	Synchronous Access (e.g. display refresh; controlled by the DI)	—
		DS2	Fmem -> DP -> Display	Asynchronous Access (e.g. display update)	—
		DS3	Fmem <-> Display	Generic Data Transfer	—
	1 flow	DS4	MCU <-> Display	Direct Access	—
Video Playback	1 flow	PL1	Bmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx	Main option	—
		PL2	Fmem -> IRT -> Bmem -> IC -> DP	Low power	Progressive source Large enough window

Table continues on the next page...

1. Specified pixel clocks frequencies are applicable for internal clocks, but may be limited by IO buffers speed capability. Final numbers are subjected to AC characterization.

Table 9-4. Time-Shared Data Flows Through The IPU (continued)

Name	Number	Type	Flow	Target	Restrictions
				(branching to DSx, as a video plane)	No other video flows
		PL3	Fmem -> VDIC -> IC -> DP	Low power (branching to DSx, as a video plane)	Interlaced source Large enough window No other video flows
Camera Preview	2 flows (VF2 may be used also as a playback flow)	VF1	Sensor -> IC -> Bmem -> IRT -> Fmem + DSx	main option	Single progressive input
		VF2	Sensor -> Fmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx	two inputs and/or interlaced input	When the VDIC is used for de-interlacing, one of the three input fields can go directly from the sensor to the VDIC
		VF4	Sensor -> IC -> Fmem + DS1	Low power RAM-less Display Single Display Buffer (in internal memory) Tearing-less	Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows
Video Record	2 flows	RCx	IC -> Bmem -> IRT -> Fmem	(branching from VFx)	
Graphic Overlays	2 flows	GF1	Fmem -> IC	(combining with the main flow	
	2 flows	GF2	Fmem -> DP		

9.2.2.1 Display Processor (DP)

The Display Processor performs all the processing required for data sent to a display.

- Combining 2 video/graphics planes
- Overlaying a simple HW cursor 32 x 32 pixels, uniform color; may be combined logically with the background.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
  - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
  - Adjustments: brightness, contrast, color saturation...
  - Special effects: gray-scale, color inversion, sephia, blue-tone...
  - Hue-preserving gamut mapping - for minimal color distortion
  - Applied to the output of combining or to one of the inputs
- Gamma correction and contrast stretching - programmable piecewise-linear map

The DP processes a single data flow at any given time, but it supports up to three data flows, by time sharing, one of them may be synchronous.

The data rate is up to 198M pixels/sec

9.2.2.2 Video de-interlacer (VDIC)

VDIC, the video de-interlacer and combiner module, has two operation modes

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color

The input and output to/from the VDIC is as follows:

- Input for de-interlacing: three consecutive fields
  - Source
    - The most recent field may come from the CSI or from system memory
    - The other two fields are read from memory
  - Field size: Supports up to 1080p
  - Pixel format: YUV 4:2:2/4:2:0, 8 bits/value
  - Typical video sources - SDTV: 480i30 (720x480 at 30 fps) or 576i25 (720x576 at 25 fps) and HDTV: 1080i30 (1920x1080 at 30 fps)
- Input for combining: two progressive video/graphics planes
  - Source: system memory
  - Plane size: up to 1920x1200 pixels.
  - Pixel format: RGB/YUV 4:2:2, 8 bits/value
- Output: progressive frame
  - Destination: to system memory or to the Image Converter.
  - Frame size: up to 1920x1200 pixels.
  - Rate: up to 198M pixels/sec.
  - Format: same as input format.

De-interlacing is performed using a high-quality 3-field filter, which is motion adaptive:

- For slow motion - retains the full resolution (of both top and bottom fields)
- For fast motion - prevents motion artifacts

VDIC supports a single video stream at any given time.

9.2.2.3 Image Converter (IC)

The Image Converter performs various operations on a video stream.

The operations performed are:

- Resizing:
  - Fully flexible resizing ratio Maximal downsizing ratio: 8:1. Subject to this limitation, any N->M resizing can be performed
  - Independent horizontal and vertical resizing ratios.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
  - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
  - Adjustments: brightness, contrast, color saturation...
  - Special effects: gray-scale, color inversion, sephia, blue-tone
- Combining with a graphics plane (e.g. application-specific overlay)
- Horizontal inversion

The IC supports three time-shared data flows: record, camera preview and playback (the first two share a common input).

The frame resolution supported is up to 4096x4096 for input and up to 1024x1024 for output. Wider frames can be processed by the IC by splitting them to vertical stripes.

Data throughput:

- For a single active task: up to 240M pixels/sec for input and up to 120M pixels/sec for output.
- For several active tasks: up to 200M pixels/sec for input and up to 100M pixels/sec for output.

9.2.2.4 Image Rotator (IRT)

The Image Rotator performs any combination of the following:

- 90-degree rotation
- Horizontal inversion
- Vertical inversion

The data throughput

- When a single task is active: up to 120M pixels/sec.
- When more tasks are active: up to 100M pixels/sec.

9.2.3 Automatic Procedures

The IPU is equipped with powerful control and synchronization capabilities to perform its tasks with minimal involvement of ARM and minimal use of memory.

In particular, it includes:

- An integrated DMA controller with an AXI master port, allowing autonomous access to the system memory.
- An integrated display controller, performing screen refresh of a RAM-less display.
- A page-flip double buffering mechanism, synchronizing read and write access to system memory, to prevent tearing effects.
- A double/triple buffer synchronization mechanism with a video/graphics source.
- Internal synchronization, e.g., between input from sensor and output to display.

As a result, in most cases, the MCU is involved only when it also performs part of the processing (e.g. video coding). In particular, the following procedures are performed by the IPU completely autonomously:

- Screen refresh for RAM-less displays
- Camera preview (displaying a view finder - a video-stream from the image sensor to the display).

NOTE

Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source).

Typically, there are extended periods of time in which there is no other activity in the system. The MCU - being idle - can be put to a low-power mode, reducing the power consumption and extending significantly the battery life.

The IPU supports several techniques to reduce further the power consumption of the display system:

- Dynamic backlight control, with low-light compensation by image enhancement

Further features and capabilities of the automatic procedures include:

- Automatic display of a changing image (animation) or moving image (scrolling).
- The timing of the display update can be adjusted to avoid tearing.
- The video stream from an image sensor can be sent directly to the display buffer used for screen refresh, while avoiding tearing.

The clock sources received by the IPU are listed in the following table.

Table 9-5. IPU Clock Sources

Name	Symbol	Source	Rate	Comments
High-Speed Processing Clock	HSP_CLK	Clock control Module	Up to 270 MHz	
Display Interface Clocks	DI_CLK0 DI_CLK1	Clock control Module or an external PLL	Up to 220 MHz	Optional; needed for synchronization with interface bridges

9.3 LVDS Display Bridge (LDB)

LVDS Display Bridge (LDB) will be used to connect the IPU (Image Processing Unit) to the External LVDS Display Interface.

9.3.1 LDB Overview

Table 9-6. IP Parametric Table

Name	Description
Function	Connectivity to displays with LVDS interface
External I/O Pins Notes: Those are LVDS IO pads	LVDS Display port: 2 channels. Each channel consists of: • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 20 IO pads.
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1
Clock sources and range	DI0_CLK, DI1_CLK - Display interface clock: 20-170 MHz DI0_SER_CLK, DI1_SER_CLK - Serializer clock: 140-595 MHz

The purpose of the LDB is to support flow of synchronous RGB data from the IPU to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

9.3.2 LDB External Ports

The LDB has the following ports:

- Two input parallel display ports.
- Two Output LVDS channels - Each channel consisting of 4 data pair, and 1 clock pair (pair=LVDS pad contains PadP, PadM).
- Control signals - to configure LDB parameters and operations.
- Clocks from SOC PLLs.

9.3.3 Input Parallel Display Ports

One or Two (DI0, DI1) parallel RGB input ports are supported (configurable). Only synchronous access mode is supported.

Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- For dual-channel output: Up to 170 MHz pixel clock (e.g. UXGA - 1600x1200 @ 60 Hz + 35% blanking)
- For single-channel output: Up to 85 MHz per interface. (e.g. WXGA - 1366x768 @ 60 Hz + 35% blanking).

9.3.3.1 Output LVDS Ports

There are 2 LVDS channels. These inputs are used to communicate RGB data and controls to external LCD displays with LVDS interface, or through LVDS receivers.

The LVDS ports may be used as follows:

- One single-channel output
- One dual channel output: single input, split to two output channels
- Two identical outputs: single input sent to both output channels
- Two independent outputs: two inputs sent, each, to a different output channel

9.3.3.2 Control signals

Control signals are used to configure LDB operation.

9.4 Video Data Order Adapter (VDOA)

The goal of the VDOA is to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

9.5 Display Content Integrity Checker (DCIC)

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

9.6 Video Processing Unit (VPUv6)

The VPU is a multi-standard video codec (encoder/decoder) capable of handling multiple streams simultaneously by time multiplexing.

It is a very flexible block consisting of hardware accelerators surrounding a programmable core. The VPU presents to the system a register mapped interface that is controlled by the embedded processor. End users should only interface with the VPU using the API that is provided with each BSP Programmers User Guide. This API isolates the user from possible changes in the register level interface.

In the following table we can see a summary of the VPU specs. The VPU has its own DMA driven AXI masters that allow it to retrieve the required data directly from system memory (DDR and iRAM). The load in the host ARM platform is negligible because it only needs to interact with the VPU at the frame level.

Table 9-7. VPU Spec Summary

Name	VPU
Function	Decode video streams including optional video processing such as rotation, deringing and mirroring.
Supported encoders	MPEG-4 SP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, CBP MJPEG Baseline
Supported decoders	MPEG-2 MP, HP VC-1 SP, MP, AP MPEG-4 SP, ASP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, MP, HP H.264-MVC BP, MP, HP DivX v3,4,5 Real Video 8, 9, 10 MJPEG Baseline On2 VP8 AVS Jizhun
External I/O Pins (List, Type, Schmidt Trigger, Speed)	No external I/O pins are needed
SoC Buses (List, Type, Bandwidth)	64 bit AXI master for accessing the system memory and the optional secondary AXI but to iRAM IPBus slave for host control
Interrupts	Two interrupts
DMA Requests	Integrated DMA controller on the AXI master port
Endianness	64 and 32 bit BE/LE
Number of instantiations	1
Clock sources and range	Core clock: up to 328 MHz AXI bus clock: up to 328 MHz IP bus clock: up to 66 MHz

NOTE

RealNetworks video codec is disabled by default on i.MX 6 series processors. Please contact your FSL sales representative for more details.

The i.MX 6Solo/6DualLite processor has a high-performance video processing unit (VPU), which covers many standard and high definition video decoders and encoders as a multi-standard video codec engine as well as several important video processing such as rotation and mirroring.

9.6.1 Basic Structure

The following Figure 9-6 shows the basic structure of the VPU. The VPU is self contained except for memory accesses. It is connected to the memory subsystem through two AXI master ports. The ARM configures the VPU operation through the IP bus that is converted to APB in a gasket.

A new feature is added for allowing VPU encoding a frame even the IPU writes only a small portion of source video (from camera sensor) into the frame buffer. This feature is called IPU-VPU sub-frame synchronization. Four additional signals are added for implementing this feature with three of them from IPU to VPU, and one of them from VPU to IPU, as shown in Figure 9-6 for the signal category of "IPU VPU sub-frame sync"

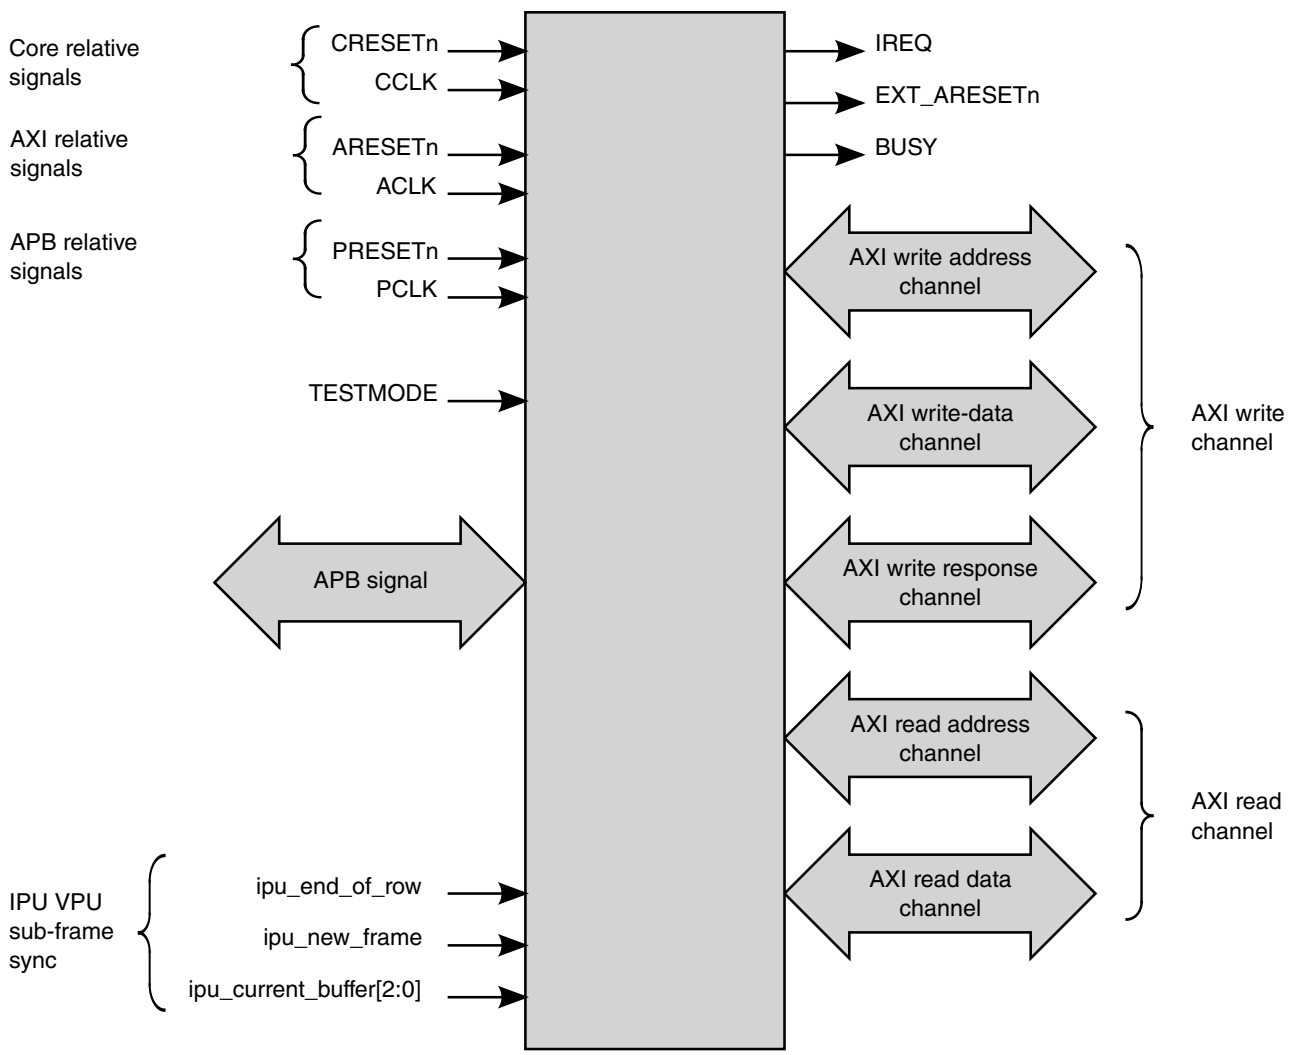

Figure 9-6. The Block Diagram of the VPU

9.6.2 Feature summary

The following table describes the VPU's encoding / decoding capabilities:

Table 9-8. VPU decoding/encoding capabilities

Dec/Enc	Standard	Profile	Resolution	Bitrate	Comments
HW Decoder	MPEG-2	Main-High	1080 i/p, 30fps	50 Mbps	1080p+SD at 30fps, 720p60
	MPEG4/XviD	SP/ASP	1080 i/p, 30fps	40 Mbps	—
	H.263	P0/P3	16CIF, 30 fps	20 Mbps	—
	H.264	BP/CBP/MP/HP	1080 i/p, 30 fps	50 Mbps	1080p+SD at 30 fps, 720p60
	H.264-MVC	BP/MP/HP	720p, 30 fps	—	—
	VC1	SP/MP/AP	1080 i/p, 30 fps	45 Mbps	1080p+SD at 30 fps, 720p60
	RV	8/9/10	1080 p, 30 fps	40 Mbps	—
	DivX	3/4/5/6	1080 i/p, 30 fps	40 Mbps	—
	On2 VP8	—	720p, 30 fps	20 Mbps	—
AVS	Jizhun	1080 i/p, 30fp	40 Mbps	—	—
MJPEG	Baseline	8192x8192	120 Mpixel/sec	Perf shown at 4:4:4 format	—
Hardware encoder	MPEG4	Simple	720p, 30 fps	12 Mbps	VPU can generate higher bitrate than the maximum specified by the corresponding standard.
	H.263	P0/P3	4CIF, 30 fps	8 Mbps	
	H.264	BP/CBP	1080p, 30 fps	14 Mbps	
	MJPEG	Baseline	8192 x 8192	160 Mpixel/sec	Perf shown at 4:2:2 format

VPU can also perform the following:

- On-the-fly (90 x n) degree simultaneous rotation and mirroring (n = 0,1,2,3).
- Post-processing
  - De-blocking filtering for MPEG-4
  - De-ringing filtering for MPEG-4 and H.264 decoder

9.7 OpenGL ES 3D Graphics Processing Unit (GPU3Dv5)

9.7.1 OpenGL Overview

9.7.2 OpenGL Features

Summary of features in the GPU3D includes:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target

- Android

9.8 2D Graphics Processing Unit (GPU2Dv2)

9.8.1 2D feature summary

GPU2D has the following features:

- Bit BLT and stretch BLT
- Rectangle fill and clear
- Line drawing
- High performance stretch and shrink
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- Support rendering size of 32Kx32K
- 90/180/270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask
- Color space conversion between YUV and RGB
- High quality image scaling, using up to 9x9 separable filter
- Bit-Blit Formats
    - A1R5G5B5 (source/destination)
    - A4R4G4B4 (source/destination)
    - X1R5G5B5 (source/destination)
    - X4R4G4B4 (source/destination)

    - R5G6B5 (source/destination)
    - X8R8G8B8 (source/destination)
    - A8R8G8B8 (source/destination)
    - 8-bit color index (source only)
    - A8 (source/destination)

9.9 HDMI TX - HD Multimedia Interface transmitter

9.9.1 HDMI Introduction

HDMI (High-Definition Multimedia Interface) is a compact audio/video interface for transmitting uncompressed digital video data and uncompressed/compressed digital audio data. HDMI connects digital audio/video sources-such as set-top boxes, Blu-ray Disc players, personal computers (PCs), video game consoles, and AV receivers to compatible digital audio devices, computer monitors, and digital televisions.

HDMI supports, on a single cable, any TV or PC video format, including standard, enhanced, and high-definition video, up to 8 channels of digital audio, and a Consumer Electronics Control (CEC) connection. The CEC allows HDMI devices to control each other when necessary and allows the user to operate multiple devices with one remote control handset.

Because HDMI is electrically compatible with the signals used by Digital Visual Interface (DVI), no signal conversion is necessary, nor is there a loss of video quality when a DVI-to-HDMI adapter is used.

The HDMI Transmitter (HDMI TX) consists of two parts:

- HDMI TX Controller
- HDMI TX PHY

Figure 9-9 depicts the HDMI TX integration scheme.

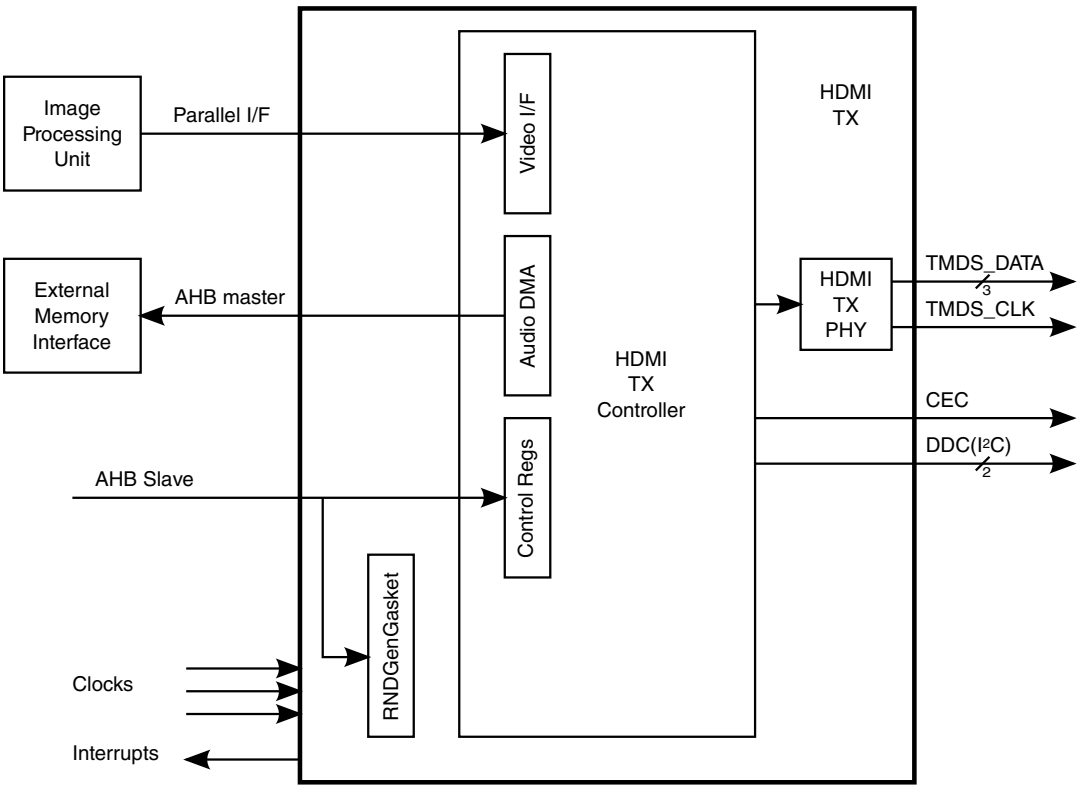

Figure 9-9. HDMI TX integration

The video interface is parallel with 24 bit/pixel data and separate signals for vertical (VSYNC) and horizontal (HSYNC) synchronization. The video data is supplied by the Image Processing Unit (IPU).

The audio data is read from an external memory by the internal Audio DMA via the master AHB interface. The HDMI TX is controlled via the AHB interface.

9.9.2 Features

The HDMI TX features are listed in Table 9-9.

Table 9-9. HDMI TX Features

Specification item	Requirement
General Features	
Standard Compliance	HDMI 1.4a

Table continues on the next page...

Table 9-9. HDMI TX Features (continued)

	HDMI CTS 1.4a DVI 1.0 HDCP 1.4
Consumer Electronic Control	Supported
Monitor Detection	Hot plug/unplug detection and link status monitor supported
Video Features	
Video Standard Compliance	EIA/CEA-861D
Supported Video Resolutions	Up to 1080p@120Hz HDTV display, up to QXGA graphics display, HDMI 1.4a 4K x 2K video formats HDMI 1.4a 3D video modes with up to 340MHz TMDS clock
Pixel Clock Frequency	From 25 MHz to 340 MHz
Input Data Formats	Parallel YCbCr 4:4:4 and parallel RGB 4:4:4 and parallel YCbCr 4:2:2
Input Color Depth	24/30/36/48 bits/pixel
Input Syncs Format	Separate HSYNC and VSYNC plus data enable control
Internal Video Processing	Interpolation YCbCr 4:2:2 to 4:4:4 Color space conversion YCbCr to RGB and vice versa
Audio Features	
Audio Standard Compliance	IEC60958, IEC61937
Supported Audio Formats	All audio formats as specified by the HDMI Specification Version 1.4a supported.
Audio Input Interfaces	Audio DMA
Audio Sampling Rate	Up to 192 kHz

9.10 Display / Sensor MIPI interfaces

9.10.1 Introduction

i.MX 6Solo/6DualLite Application Processor features MIPI DSI/CSI-2 interfaces that includes:

- MIPI DSI Host controller with associated MIPI D-PHY Tx (One clock lane, two Data lanes)
- MIPI CSI-2 Host controller with associated MIPI D-PHY Rx (one clock lane, two Data Lanes)

9.10.2 MIPI DSI

MIPI DSI is a high performance serial interconnect bus for mobile applications connecting display system to the host system.

Table 9-10. DSI Parametric Table

Name	DSI
Function	High speed serial interface controller for MIPI Display interface
Supported standard version	MIPI DSI Compliant DSI Version 1.01 DPI Version 2.0 DBI Version 2.0 DCS Version 1.02 PPI for D-PHY MIPI D-PHY Version 1.0
External I/O Pins (List, Type, Schmidt Trigger, Speed)	Analog at chip boundary: DATAP[1:0] DATAN[1:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND
SoC Buses (List, Type, Bandwidth)	Synchronous Pixel Interface (DPI) Display Bus Interface (DBI) IPB slave interface x 32 bit PPI to D-PHY
Interrupts	1
DMA Requests	N/A
Num of instantiations	1
Clock sources and range	AHB clock (132MHz) Reference clock for Tx D-PHY - 6 ... 27 MHz

There is one instance of DSI port in the chip. This interface support from 80 Mbps up to 1 Gbps speed per data lane. The DSI Receiver core can mange one clock lane and up to 4 data lanes through the lane management, however two data lanes are implemented in the transmitter D-PHY, therefore the maximum throughput of display port is 2Gbps.

DSI host core is capable of supporting a variety of resolutions and formats:

- Resolution:
  - QQVGA
  - QCIF, QVGA
  - CIF
  - VGA
  - WVGA
  - SVGA
  - XVGA
- Pixel format:
  - RGB565
  - LRGB565
  - RGB666
  - RGB888

The DSI can support both command and video modes and up to four virtual channels to accommodate multiple displays.

- Command and video mode support (type 1, 2, 3, and 4 display architecture)
- Mode switching: low power and ultra low power
- Burst mode: dual video channel
- Non-burst mode: single video channel
- Bus turnaround
- Fault error recovery scheme

DPI and DBI could coexists in the system but only one of them could be active in a certain time moment

9.10.3 MIPI CSI-2

MIPI CSI-2 is a high performance serial interconnect bus for mobile applications connecting camera sensors to the host system.

Table 9-11. CSI Parametric Table

Name	CSI-2
Function	High speed serial interface controller for MIPI sensor interface
Supported standard version	MIPI CSI-2 Version 1.0 MIPI PPI interface for D-PHY MIPI D-PHY Version 1.0
External I/O Pins (List, Type, Schmidt Trigger, Speed)	Analog at chip boundary:

Table continues on the next page...

Table 9-11. CSI Parametric Table (continued)

Name	CSI-2
	DATAP[1:0] DATAN[1:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND
SoC Buses (List, Type, Bandwidth)	Synchronous Pixel Interface - 32 bit, data formatting compliant to CSI-2 specification IPS slave interface x 32 bit
Interrupts	2
DMA Requests	N/A
Num of instantiations	1
Clock sources and range	AHB clock (132 MHz)

There is one instance of CSI-2 port in the chip. This interface supports from 80 Mbps up to 1 Gbps speed per data lane. The CSI-2 Receiver core can mange one clock lane and up to two data lanes through the lane management and de-packetization, providing a maximum throughput of 4 Gbps transfer rate.

9.10.4 D - PHY

D-PHY serves as physical layer for both MIPI DSI and CSI-2 interfaces.

D-PHY Transceiver unit is responsible for transmission and reception of data in High speed (HS) or Low Power (LP) mode. High speed mode is used for high-speed data transmission while the low power mode used for the control purpose. Point-to-point lane interconnect can be used for either data or clock signal transmission. High speed receiver is a differential line receiver while low- Power receiver is an un-terminated, single-ended receiver circuit.

Table 9-12. D-PHY Parametric Table

Name	D-PHY TX, D-PHY RX
Function	MIPI D-PHY dual mode transceiver
Supported standard version	D-PHY specification v1.0

Table continues on the next page...

Table 9-12. D-PHY Parametric Table (continued)

Name	D-PHY TX, D-PHY RX
External I/O Pins (List, Type, Schmidt Trigger, Speed)	One differential pair per lane. See CSI-2 and DSI parametric tables
SoC Buses (List, Type, Bandwidth)	PPI i/f
Interrupts	
DMA Requests	N/A
Num of instantiations	6 - 3 in DSI interface and 3 for CSI-2 interface
Clock sources and range	Reference clock - 6...27MHz

A single lane module is shown in the figure below.

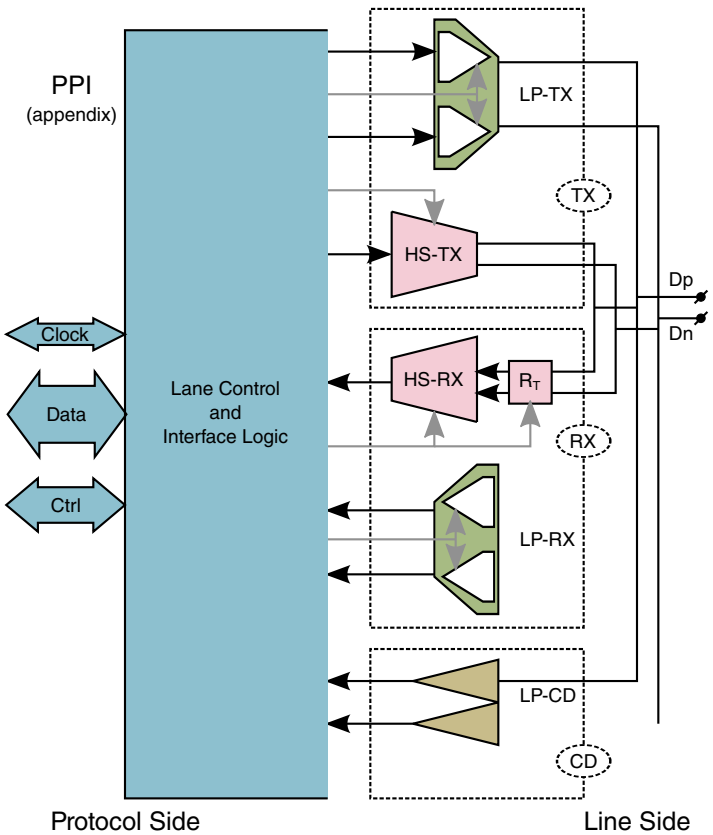

Figure 9-10. Single lane D-PHY- Block Diagram.

There is one instance of D-PHY TX (hard macro; two data lanes, one clock lane, PLL) and one instance of D-PHY RX (hard macro: four data lanes, one clock lane, no PLL) in i.MX 6Solo/6DualLite.

9.11 Audio subsystem

The audio subsystem consists of the following modules: SSI-1, SSI-2, SSI-3, AUDMUX, ESAI, SPDIF, ASRC, and MLB. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

Audio Subsystem Module Overview provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

9.11.1 Audio Subsystem Module Overview

The following figure shows a high level block diagram of the audio subsystem.

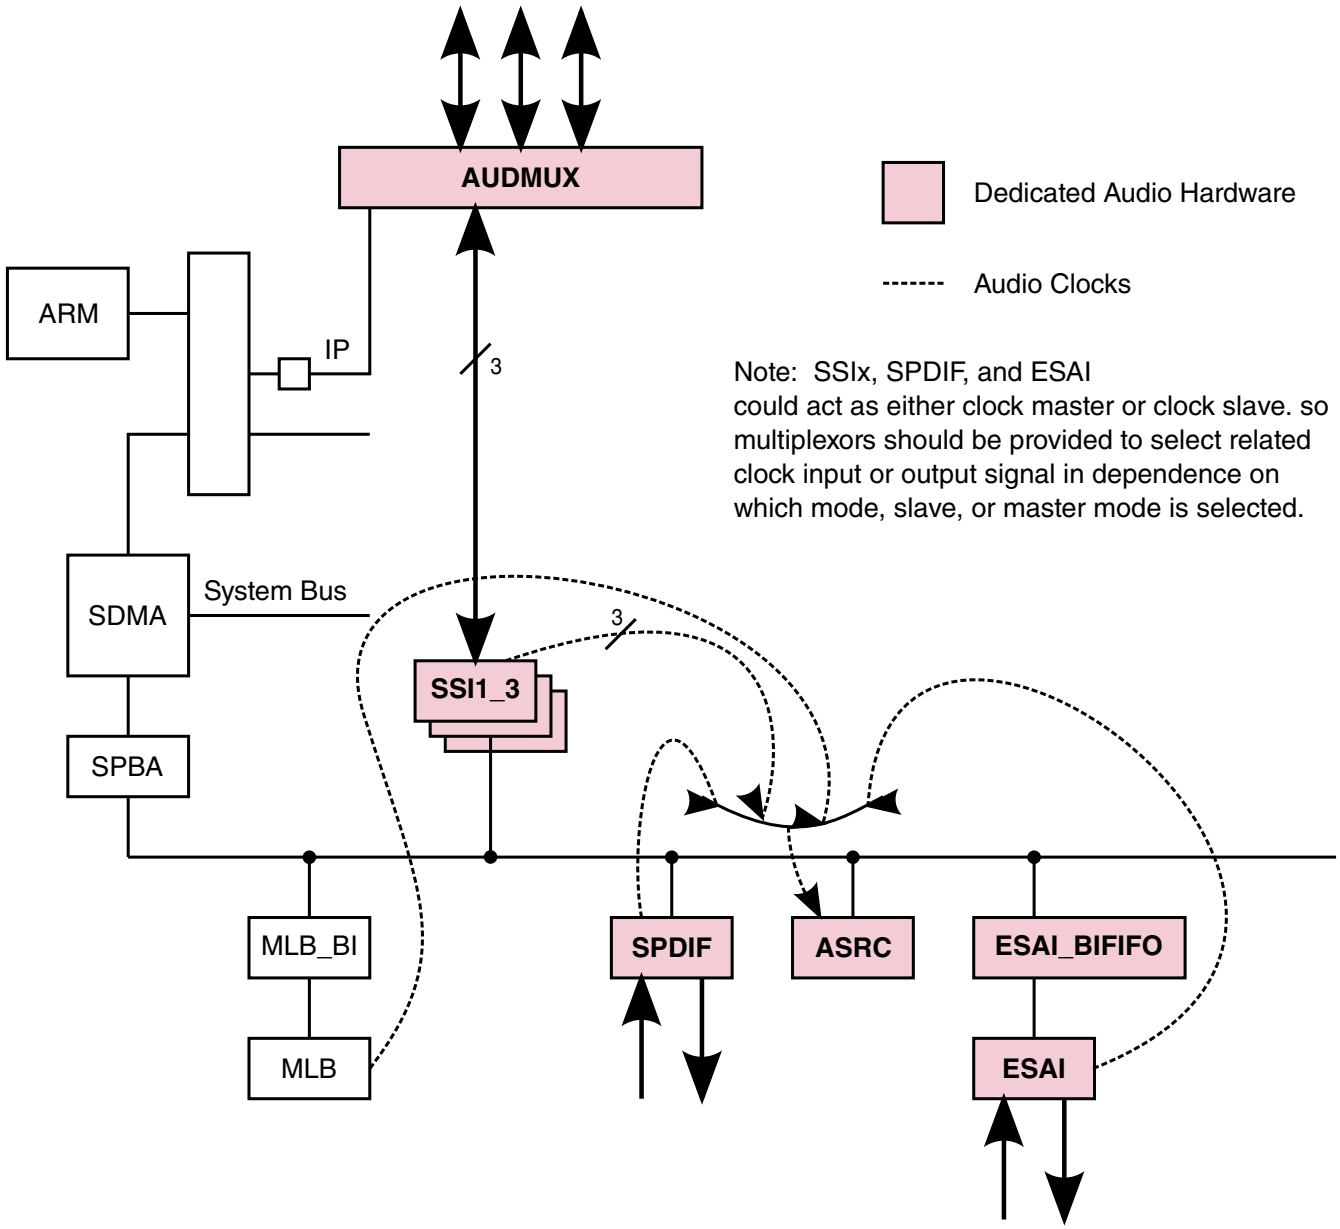

Figure 9-11. Audio subsystem block diagram

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX provides flexible, programmable routing of the serial interfaces (SSI1, SSI2, or SSI3) to and from off-chip devices. AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

ESAI (enhanced serial audio interface) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors. ESAI consists of independent transmitter and receiver sections, and each section has its own clock generator. ESAI is connected to the IOMUX and to the ESAI_BIFIFO module.

ESAI_BIFIFO (ESAI bus interface and FIFO) is the interface between the ESAI module and the shared peripheral bus. It contains the FIFOs used to buffer data to and from ESAI. It also provides the data word alignment and padding necessary to match the 24-bit data bus of the ESAI to the 32-bit data bus of the shared peripheral bus.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

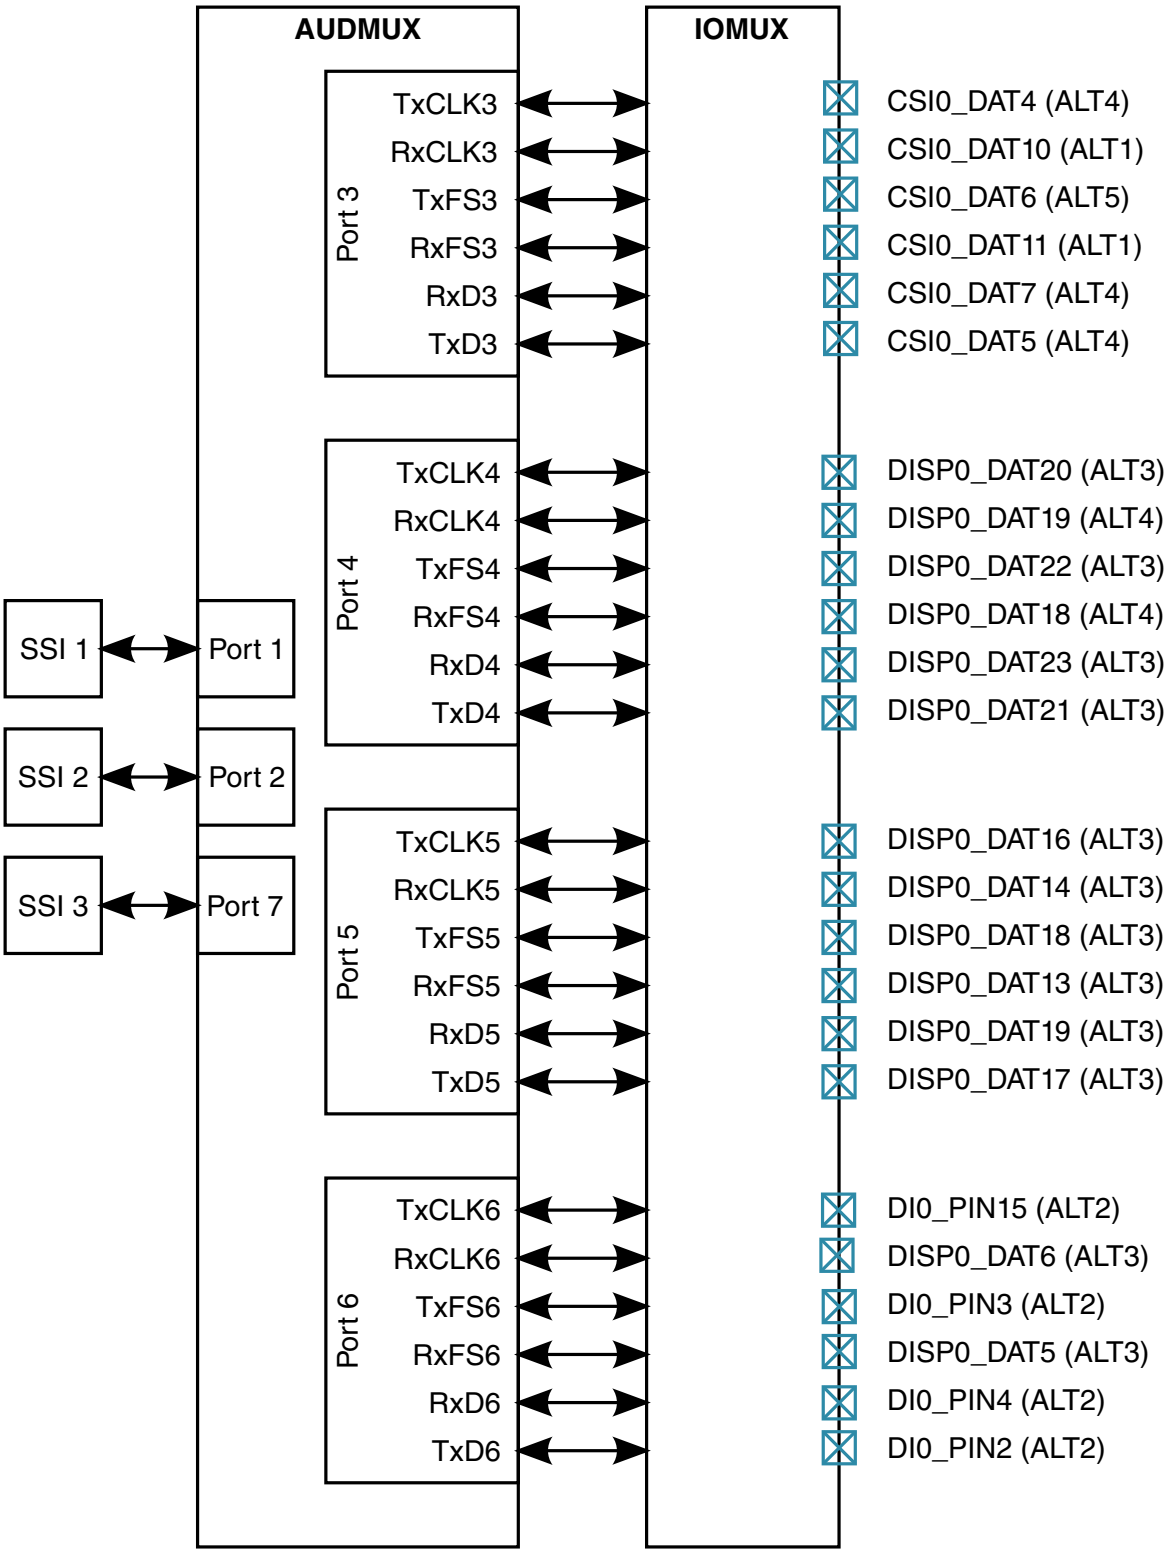
ASRC (asynchronous sample rate converter) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of over 120dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs. ASRC is connected to the shared peripheral bus.

9.11.2 Synchronous Serial Interface (SSI)

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.



9.11.3 Digital Audio MUX (AUDMUX)

The Digital Audio Mux (AUDMUX) provides a programmable interconnect fabric for voice, audio, and synchronous data routing between host serial interfaces, such as SSI, and peripheral serial interfaces-that is, audio and voice codecs.

The AUDMUX includes two types of interfaces. Internal ports connect to the processor serial interfaces, and External ports connect to off-chip audio devices. A desired connectivity is achieved by configuring the appropriate host and peripheral ports.

The AUDMUX provides flexible, programmable routing of the on-chip serial interfaces to and from off-chip audio devices. The AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself.

The following figure illustrates how the AUDMUX is connected in the system.

⊠ - Daisy Chain, i.e. more than one PAD is available (only one option shown above).

Figure 9-12. AUDMUX System Block Diagram

9.11.4 Enhanced Serial Audio Interface (ESAI)

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The ESAI has 12 pins for data and clocking connection to external devices. The ESAI is internally connected to the ESAI_BIFIFO, and does not connect directly to the shared peripheral bus. The ESAI interface is designed for a 24-bit data bus, while the shared peripheral data bus is 32-bit wide. Also, the ESAI data paths are only double buffered, not allowing efficient DMA service in the applications processor environment. The ESAI_BIFIFO allows increasing the data buffering and data width matching to the shared peripheral bus.

9.11.5 Sony/Philips Digital Interface (SPDIF)

The SPDIF module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. The chip provides one SPDIF transmitter with one output.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the

corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The ESAI, SSI's and MLB clock sources should provide a clock that is at least 64 x Fs, where Fs is the sampling frequency. The external clock source should provide at least 128 x Fs. Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, 128x, 256x or 512x). Also, clock frequency precision of 100ppm or better should be provided.

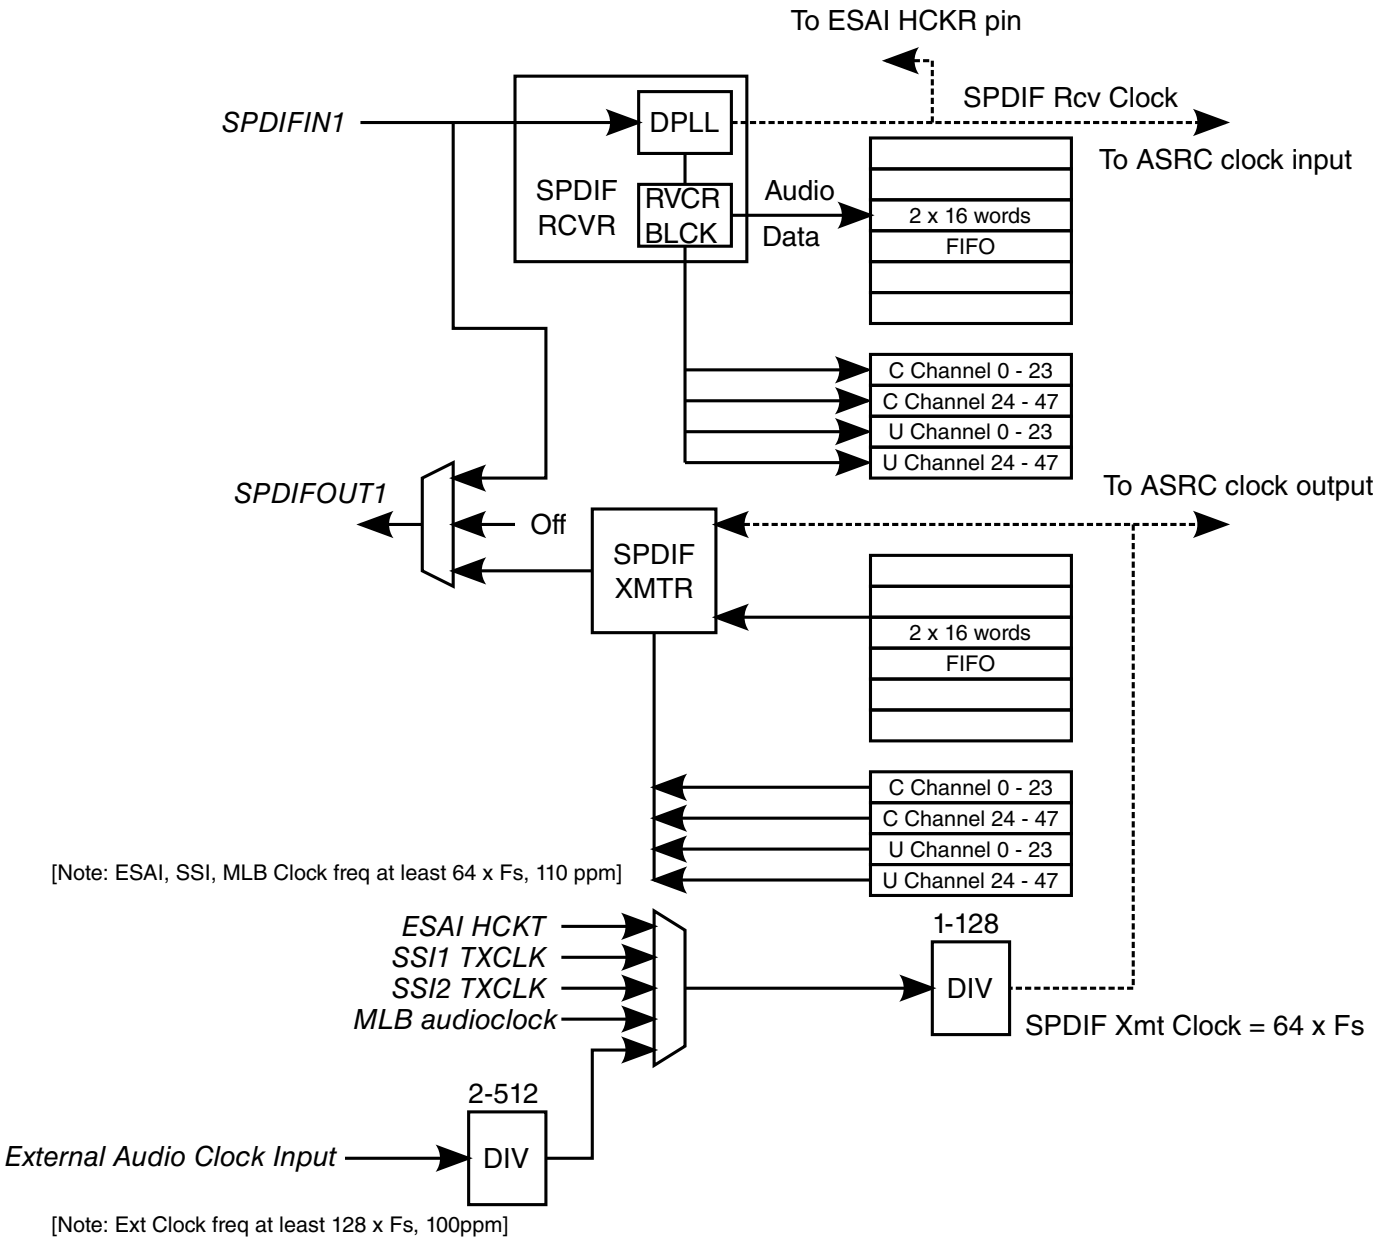


Figure 9-13. SPDIF Transceiver Clock Diagram

9.11.6 Asynchronous Sample Rate Converter (ASRC)

The incoming audio data may be received from various sources at different sampling rates. The outgoing audio data may have different sampling rates, and it can also be associated to output clocks that are asynchronous to the input clocks.

ASRC converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sampling rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs.

In the real-time audio use case, both input/output sampling rate clocks are activated. Both sampling rate clocks are directly connected to ASRC, and the ratio estimation of the input clocks to output clocks is used to perform the sample rate conversion in ASRC hardware.

The SSI1, SSI2, SSI3, S/PDIF, ESAI, and MLB audio modules can act as either a clock master or a clock slave. Multiplexors are provided on a chip level to select which of the module's clock signal, input or output, will be connected to ASRC input in dependence of the module's operational mode as it is shown in Figure 9-14 and Table 9-13. Figure 9-14 presents the multiplexor cell used for all ASRC input clocks. Table 9-13 shows the detailed clocks, multiplexor control and data bits for each ASRC input clock. For the audio blocks clocks that are directly conected to ASRC (without the multiplexor scheme) see Table 9-14.

In the non-real time streaming audio use case, the input sampling rate clock does not need to be provided. Instead the ideal-ratio value conversion is set in the ASRC interface registers. In this case only the output sampling rate clock must be provided, and the fixed ratio of the input to the output in the register is used to perform the sample rate conversion.

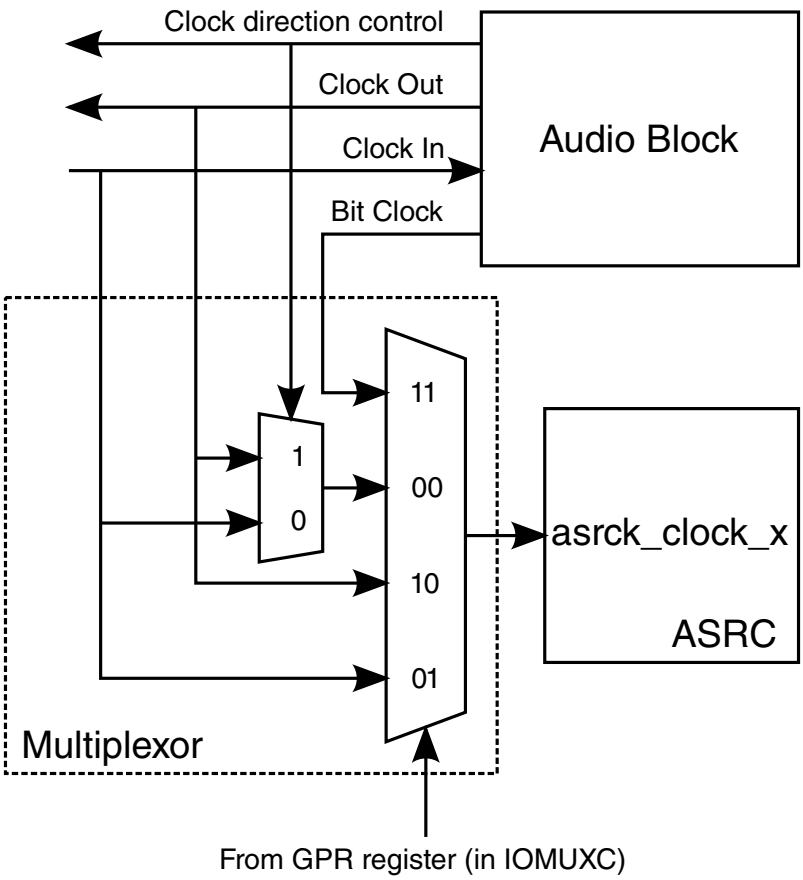

Figure 9-14. Muxing scheme template for ASRC input clocks

Table 9-13. ASRC Muxed Input Clocks

ASRC Clock Input	Audio block source	MUX2:1 Control	MUX2:1 Input 0	MUX2:1 Input 1	MUX4:1 Control	MUX4:1 Input 00	MUX4:1 Input 01	MUX4:1 Input 10	MUX4:1 Input 11

Chapter 10
Clock and Power Management

10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

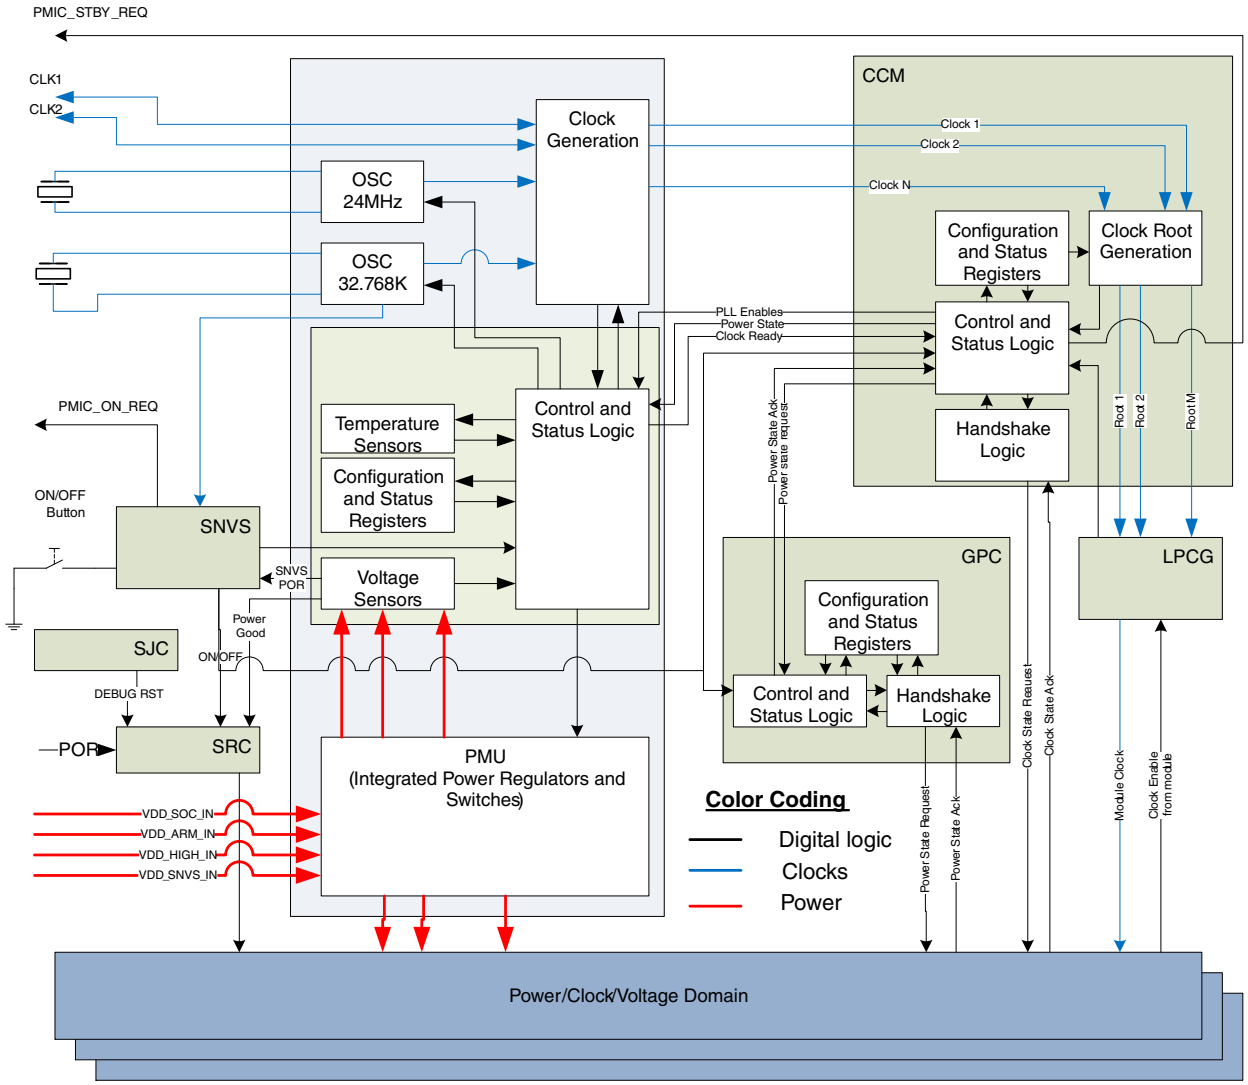

Figure 10-1. Power and clock management framework

10.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- CCM (Clock Control Module): The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See Clock Controller Module (CCM)) for

information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See Clock Controller Module (CCM) for information on the LPCG architecture and functional description.

10.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management sub-system are implemented in the following blocks:

- Power Management Unit (PMU). See Power Management Unit (PMU) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See General Power Controller (GPC) for information on the GPC architecture, functional description and programming model.

10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the System Reset Controller (SRC).

10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

10.3 Clock Management

10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

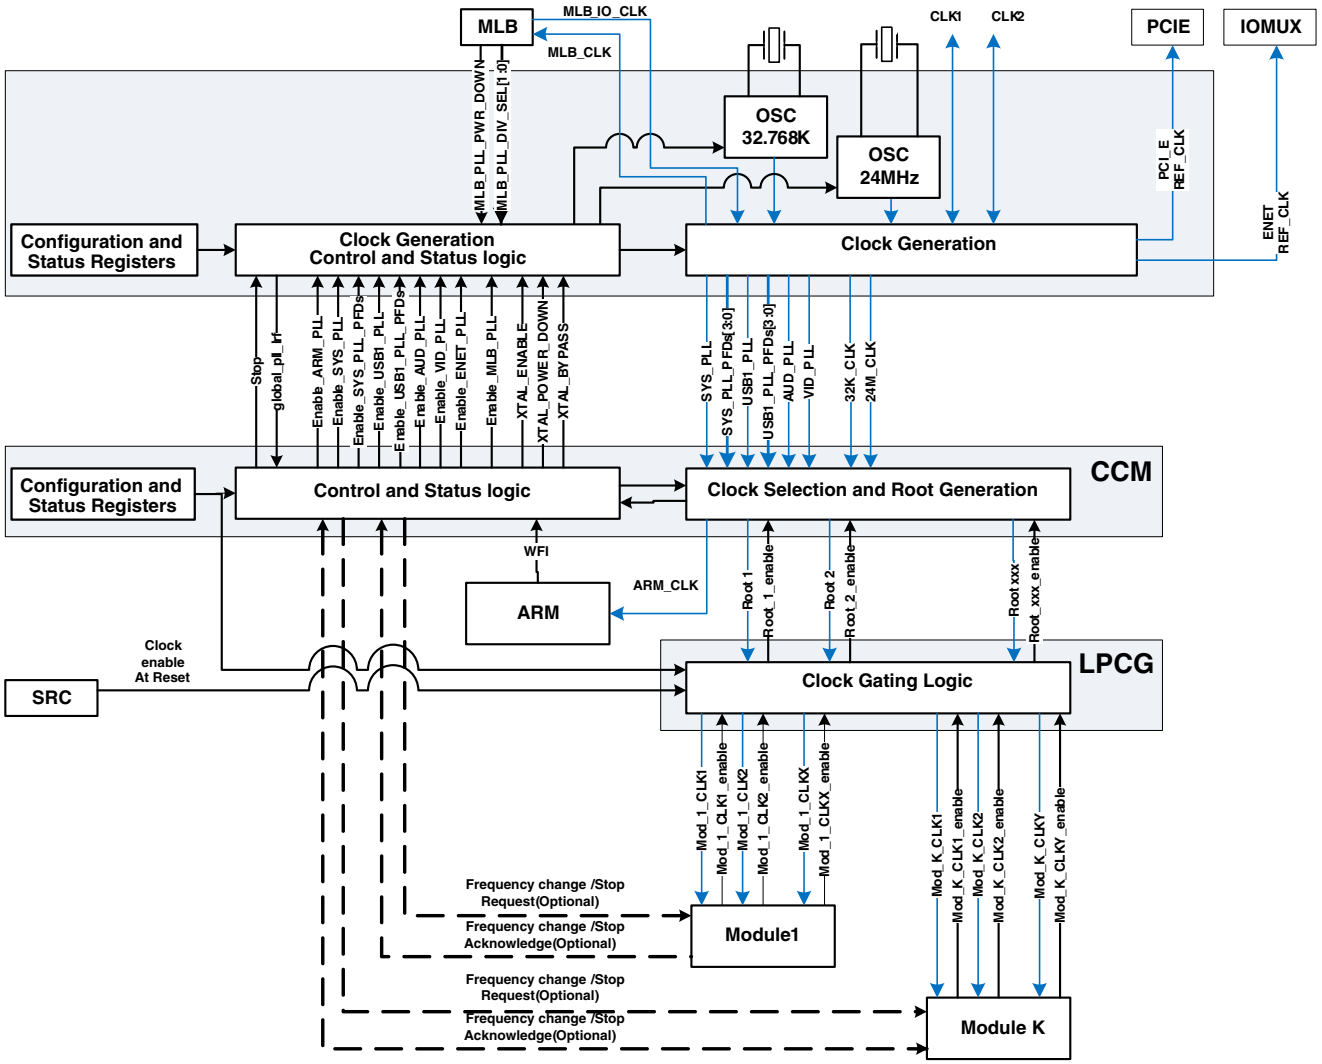

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

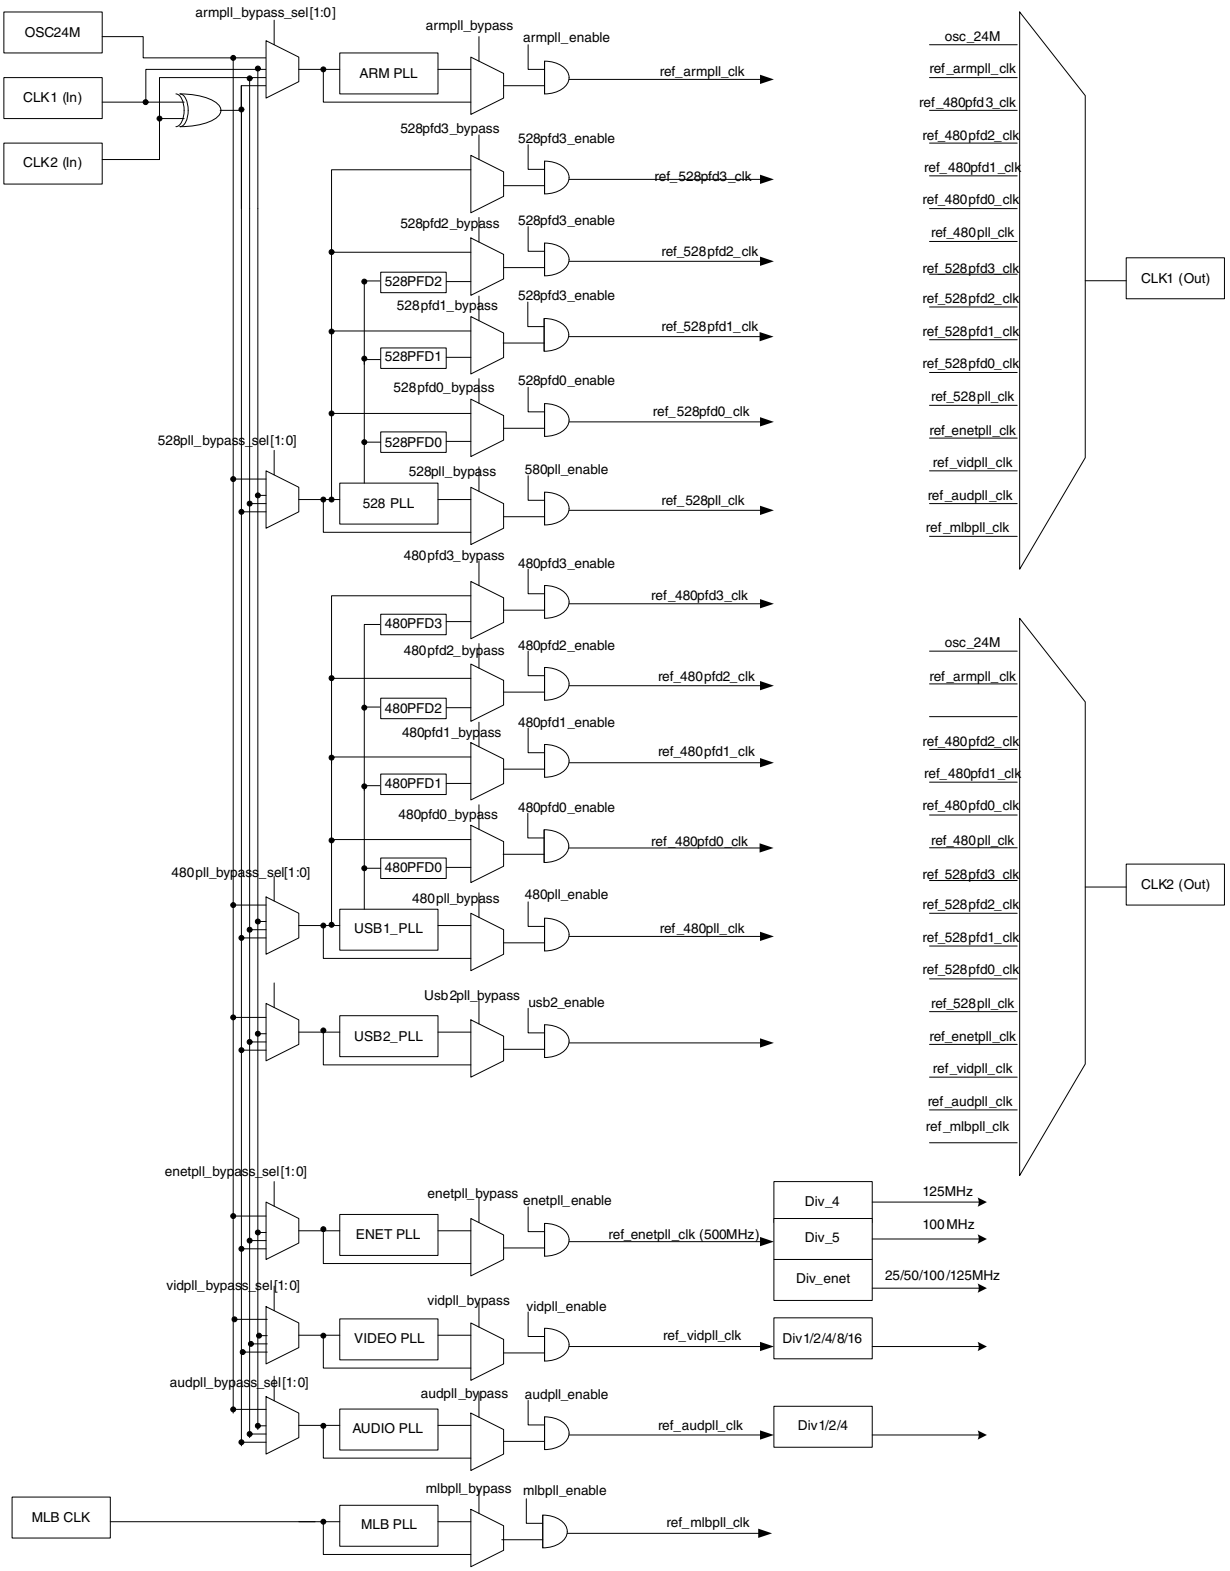

Figure 10-3. Primary Clock Generation

10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See Crystal Oscillator (XTALOSC) for details of the XTALOSC block.

10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports

There is two LVDS I/O ports used for clock generation. The low jitter differential I/O portsare provided to input and output clocks. It can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or it can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

10.3.2.3 PLLs

Eight PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces 18/N x Fvco at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The eight PLLs are listed below:

- PLL1 (also referred to as ARM_PLL) - This is the PLL clocking the Arm core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3 GHz (may exceed chip capabilities, see datasheet for more information).
- PLL2 (also referred to as System_PLL or 528_PLL) - PLL2 generally runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. It has the capability to spread spectrum the generated signal. Besides the main output, this PLL drives four PFDs (528_PFD0...528_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure and/or can be spread-spectrum modulated. Typically, this PLL is a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1_PLL or 480 PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USB0 PHY, also known as OTG PHY). This PLL also drives four PFDs (480_PFD0...480_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART, CAN and other serial interfaces, audio interfaces, etc.
- 480_PLL2 (also referred to as USB2_PLL) - This PLL provides clock exclusively to USB2 PHY (also known as HOST PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or16 from the PLL VCO frequency
- PLL6 (also referred to as PLL_ENET) - This PLL implements a fixed 20+(5/6) multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
- 125 MHz for the PCIe serial interface and reduced gigabit ethernet interface.

- 50 or 25 MHz for the external ethernet interface.
- MLB_PLL - This PLL takes the Media Link Bus (MLB) interface clock, multiplies it up by 1, 2, or 4, and delay compensates so that the MLB data stream can be captured.

10.3.2.3.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the BYPASS_CLK_SRC field of the PLL control register. See CCM Analog Memory Map/ Register Definition for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be clock un-gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at www.nxp.com for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

CCM Memory Map/Register Definition and CCM Analog Memory Map/Register Definition contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the Power modes, namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- Arm core clock - "on the fly" without clock interruption, by either shifting between PLL sources PLL clock change or by changing the divider ratio.
- changing of the DDR memory controller clock. See MMDC handshake and Self refresh and Frequency change entry/exit for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the system.

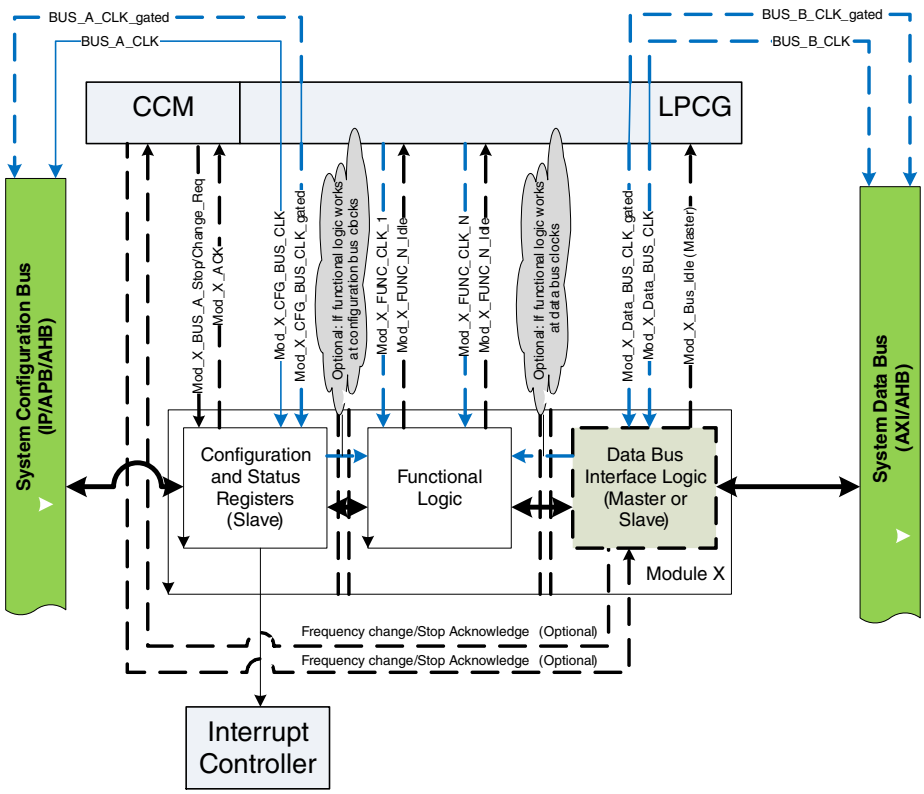

Figure 10-4. Clock interface of the functional module in the system

10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity (in the case of IPU, that could be the clock for a display interface or a camera sensor interface).
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of modules supporting master clock protocol areGPU3D, VPU,GPU2D, VDOA and USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM_CMEOR).

10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN,EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Overide Register (CCM_CMEOR). See CCM Memory Map/Register Definition for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

Examples of clock domains are: Main AXI bus clock domain, VPU clock domain, GPU3D clock domain, etc.

10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

10.4 Power management

10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

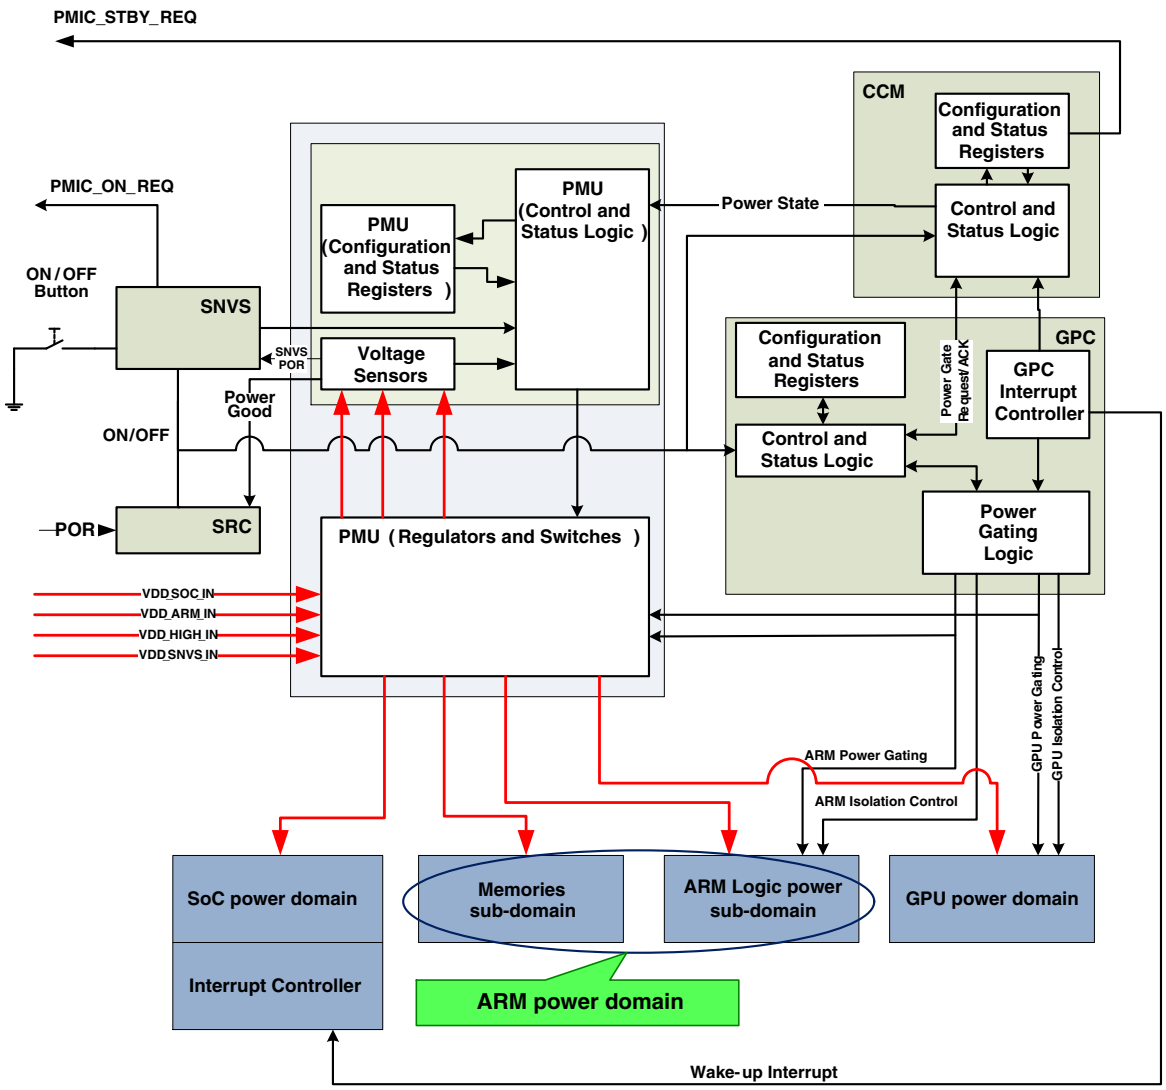

Figure 10-5. Power Management System

10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

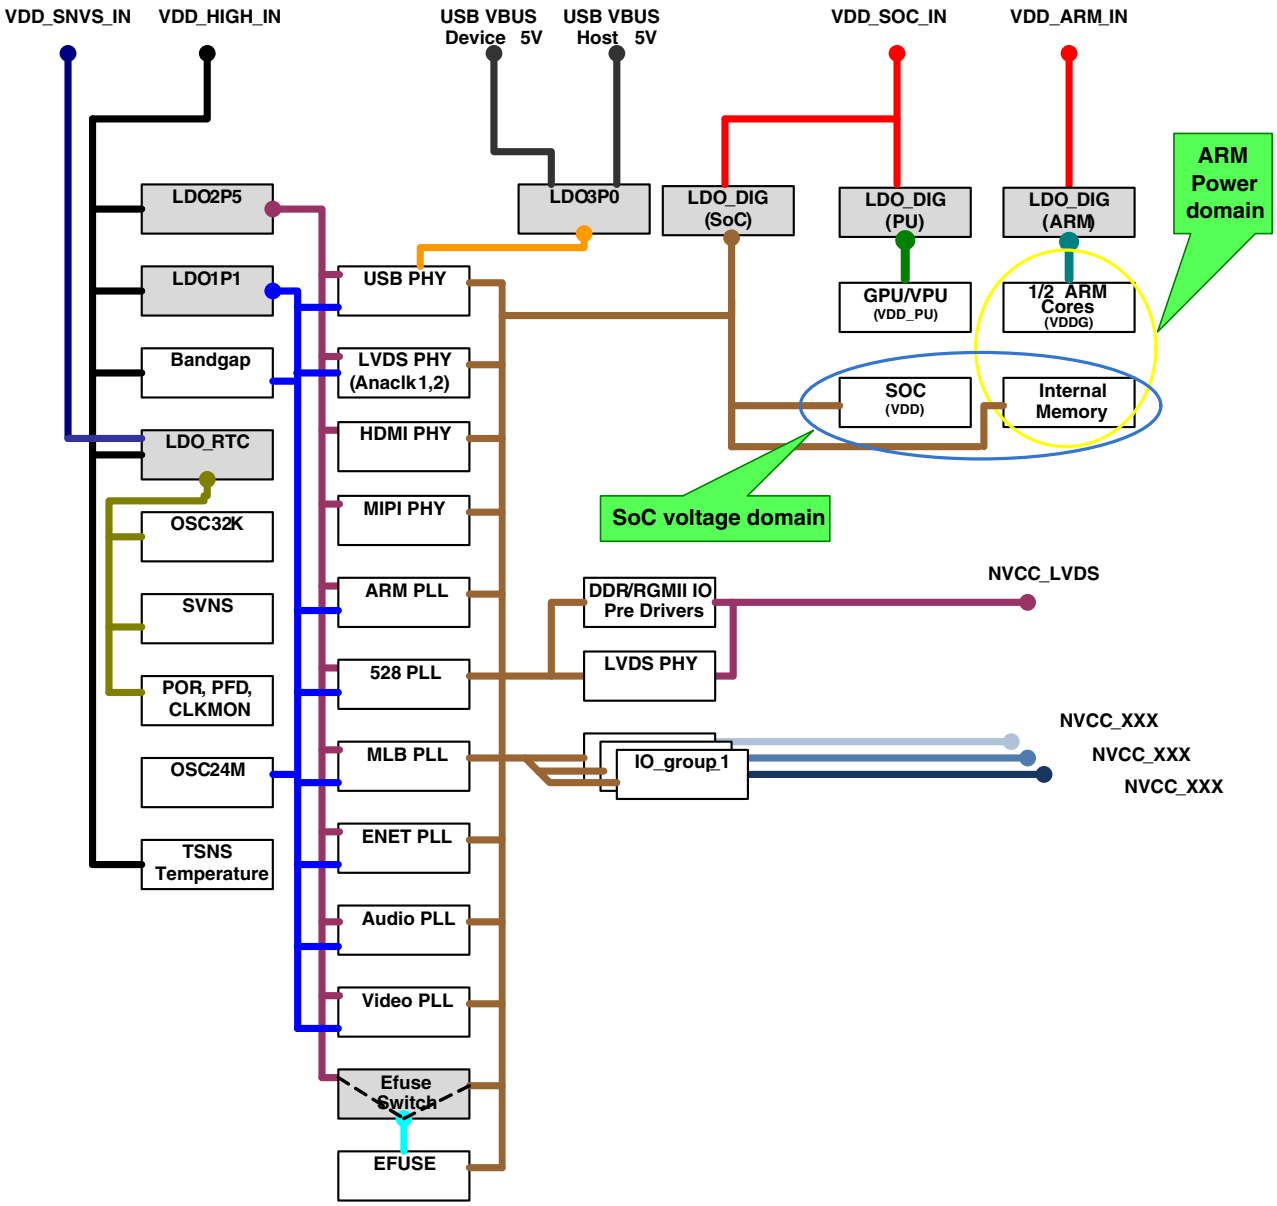

Figure 10-6. i.MX 6Solo/6DualLite Power Tree

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator
- Reverse well biasing

See Power Management Unit (PMU) for further details on integrated PMU functional description and programmability.

10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO_ARM, LDO_PU, and LDO_SOC. These regulators provide power to the ARM_Core power domain, the combined VPU, IPU, and GPU power domain, and the rest of the SoC logic (except always-ON SNVS domain).

NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- Internal Bypass - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to PMU for further details on bypass and power gate configuration.
- External Bypass - The input and output of the regulator are shorted externally to the SoC. If operating in this configuration, enable the internal bypass early in the startup sequence before attempting high frequency/high power operation. Be aware that internal power gating is not available in this mode.
- Power Gate - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load. Power gating is applicable to Arm and PU power domains.
- Analog regulation mode - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in Miscellaneous Control Register (PMU_MISC2*n*).

For further details of LDO programming and configuration please refer to Digital Regulator Core Register (PMU_REG_CORE*n*).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for Arm core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In"full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for Arm domain is implemented by programming associated LDO.

In highly power-optimized systems, it is possible to use multiple external DCDC buck converters and bypass internal LDO for high power domains. The obvious trade-off is in the increased complexity of the external power supply components and the associated increase in the BoM and board design complexity.

10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO_1P1 - The LDO_1P1 (VDD_HIGH_IN, NVCC_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.

10.4.1.1.3 USB LDO

The USB_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which in turn powers the real time clock and low power section of the SNVS modules. If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary.

10.4.1.1.5 Reverse well biasing

The reverse well biasing module on the SoC consists of a self-clocked/self-regulating charge-pump circuit, used to generate a negative bias voltage for the floating PWELL, and a low-power regulator. The low-power regulator is used to generate a positive bias voltage for the NWELL of the digital logic cells on the SOC power domain. Static leakage reduction can be achieved during SoC low-power modes through the use of these reverse well bias voltages. Please refer to the CCM_CLPCR register in CCM Memory Map/Register Definition and PMU_MISC0 in PMU Memory Map/Register Definition for details about well bias control and Static " for functional description of the reverse well biasing.

10.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
- Controls the CPU power domain and the combined GPU/VPU power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 128 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See General Power Controller (GPC) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See System Reset Controller (SRC) for further details on SRC functional description and programmability.

10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

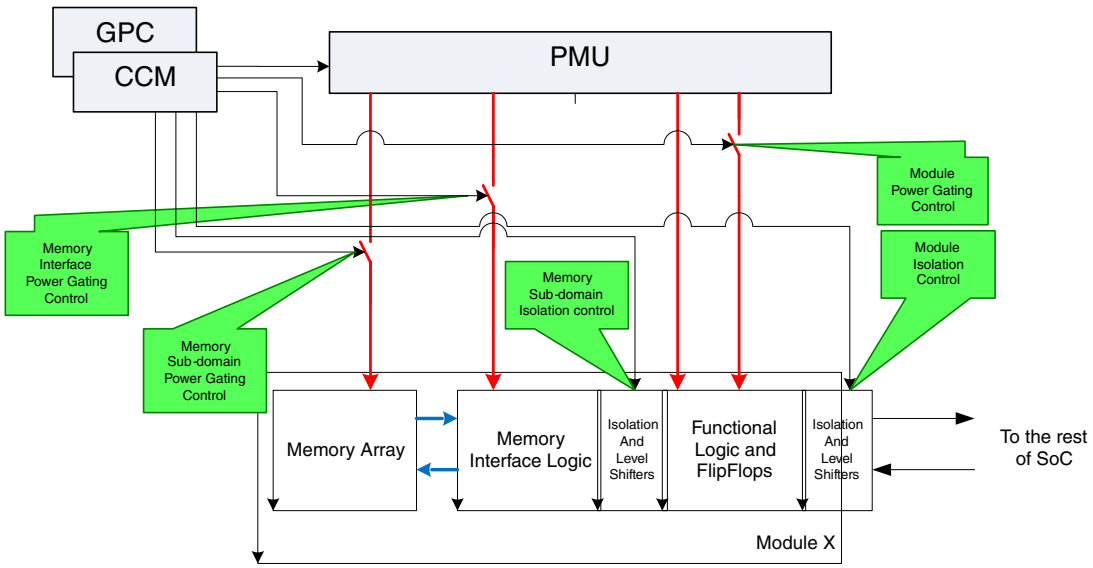

Figure 10-7. Power domain interface

10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- Arm - The Arm domain contains the Arm Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- Arm Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and Arm domain). In normal operation mode (functional mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, Arm). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- Combined GPU and VPU domain - The combined GPU/VPU domain contains all GPU3D and GPU2D engines and VPU engine.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal

regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- Arm Cortex-A9 memories - Power gating only.
- GPU3D and VPU - Power gating only.

See table below for details of the system power domains layout and dependencies.

10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.

- GPU3D, GPU2D and VPU: These three modules can be power gated (together) independently of Cortex-A9 power gating, because it resides on a separate power domain. State retention is supported neither for GPU3D, GPU2D and VPU logic nor for their internal memories.
- ANALOG PHY IPs - PCIe and HDMI - hardware state-retention since its supplies are driven by non-gated supplies.
- SoC - hardware state-retention in Standby mode. Reverse Well Biasing is applicable for this domain.
- SNVS_LP - hardware state-retention even when SoC supplies are removed.

10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

10.4.1.4.3.1 Arm Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in PGC Memory Map/Register Definition as follows to power-down the core on the next "WFI" instruction:
   - Configure the GPC/PGC PGC_CPU_PDNSCR Register ISO and ISO2SW bits. The ISO field determines the delay between the power-down request and enabling the platform isolation. The ISO2SW field determines the delay between the platform isolation and the actual power-off switch to the supplies.
   - Configure the GPC/PGC PGC_CPU_PUPSCR Register SW and SW2ISO bits. The SW field determines the delay between the power-up request and the actual power-up of the supplies. The SW2ISO field determines the delay between asserting power toggle and negating platform isolation.
   - Configure the GPC PGC PGC_CPU_CTRL PCR bit to allow the power down of the platform
   - Arm Core Platform should execute a "WFI" instruction.

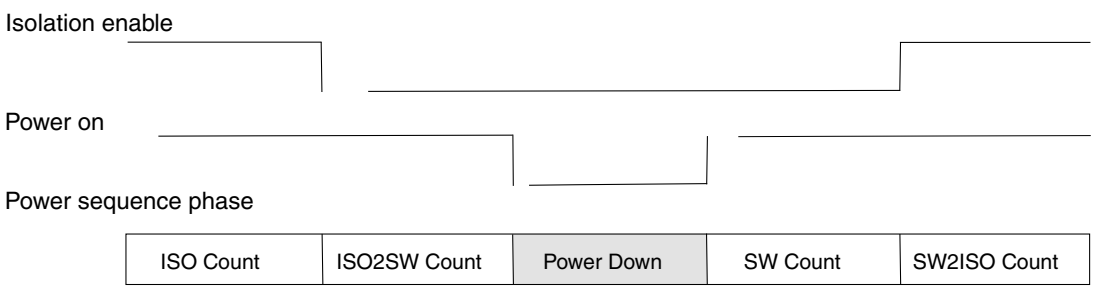

Figure 10-8. Arm Core Platform isolation and power on switch flow

10.4.1.4.3.2 GPU3D, GPU2D and VPU

1. Configure the CCM CGR bits (CCM Memory Map/Register Definition) to disable the GPU3D, GPU2D and VPU clocks.
2. Configure the GPC/PGC Registers (GPC Memory Map/Register Definition) as follows to power-down isolate the GPU3D, GPU2D and VPU logic from the rest of the SoC logic :

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC_CNTR to power down GPU3D, GPU2D and VPU

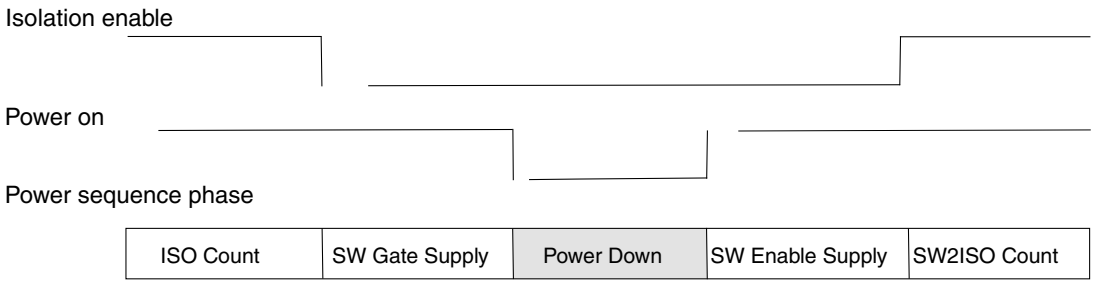

Figure 10-9. GPUs and VPU isolation and power on switch flow

10.4.1.4.3.3 SoC

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM_CCR[COSC_EN] (CCM Memory Map/Register Definition). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- Enable reverse well biasing by configuring the CCM_CLPCR[WB_PER_AT_LPM] bit (CCM Memory Map/Register Definition).
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS_LP is powered through an "always on" supply, configuring the SNVS_LP DP_EN to "1" allows changing the PMIC_ON_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform - Isolation needs to be enabled before power-down. This is taken care of automatically after CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- GPU3D, GPU2D and VPU - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS_LP - Different from the 2 domains above, the SNVS_LP isolation isolates the signals coming from the SoC to the SNVS_LP. This is required for saving the contents of the SNVS_LP (such as the real-time clock). The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

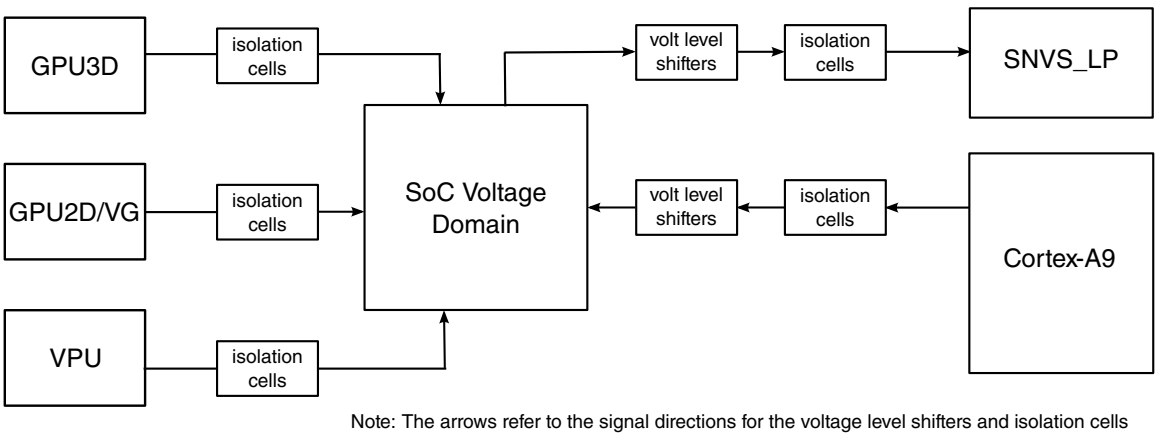

Figure 10-10. Isolation cells and Voltage level shifters placing

10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- Arm - Cortex-A9 Core Platform including L1 cache - Scalable voltage in both dynamic and static scenarios
- SoC and PU LDO Domains - Scalable voltage only in static scenarios
- ANALOG components including PCIe, LVDS andHDMI, MIPI, LVDS and PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS_LP - Fixed voltage

10.4.1.6 Voltage domain management

10.4.1.6.1 Dynamic

10.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the Arm, SoC and PU LDOs voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

10.4.1.6.2 Static

10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains
- Reverse well-biasing in STOP, WAIT, or Deep Sleep Mode (DSM) modes

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM_CCR), CCM Low Power Control Register (CCM_CLPCR) and PMU Miscellaneous Register 0 (PMU_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage and reverse well bias to the SoC:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM_CCR[RBC_EN] bits to bypass and disable PMU regulators in the next Arm "WFI" execution.
- Configure CCM_CCR[REG_BYP_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Arm Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode
- After that, the reverse well bias will be applied automatically (if enabled) with appropriate delay. Please refer to CCM_CLPCR and CCM_CCR Registers in CCM for further information on reverse bias enabling and counters configuration.

10.4.1.6.2.2 ANALOG PHYs IPs

The PCIe and HDMI analog PHYs can also be configured to consume less power when the are in a non-active state. Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the ENABLE_WEAK_LINREG in the PMU PMU_REG_2P5 register.

10.4.1.7 System domains layout

The following table describes the different power modes.

NOTE

Wakeup time is the hardware perspective, and doesn't reflect the time it takes software to resume drivers and perform system operations.

Table 10-1. Aimed power modes

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
RUN	Power supplies are on, all clocks are on.	N/A	N/A	All
WAIT	Power supplies are on. Arm executes WFI command, Option to gate off clocks for specific modules based on programmable bits.	Based on interrupt from any module	Immediate (Arm exit WFI)	IDLE process of operating system.
STOP	Power supplies are on. Arm executes WFI command. VPU and GPU are in power gating PLLs are off, hence all system clocks are off.	Based on interrupt from modules that can track operation with low frequency clock- like Keypad press, GPIO, Timer, CAN activity, etc.	~50us	Suspend state of operating system - system is on but is waiting for operation.
Standby	- PLLs disabled - Low voltage could be applied to Arm and SoC power inputs - Chip regulator bypass if reduce supply voltage, - Well Bias could be activated - CPU regulator disabled for power gating - PU regulator is disabled in software - xtal enabled	Same as above	~220 us	Low power standby mode with limited reaction on external events
Deep Sleep	Same as above but with OSC24M disabled	Interrupts from modules those could generate asynchronous interrupts (Keypad, GPIO, SNVS)	~1400us	
SRTC	Only SNVS domain and OSC32K keep alive	SRTC security alert / SRTC timer expire. Based on each one of those, SRTC module will generate request to PMIC to perform POR sequence and walk-up the system. The system will go through boot process.	~1700us to WARM boot COLD boot, depends on boot procedure and boot device	

Table 10-1. Aimed power modes

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
		PMIC can also receive press on "ON" button to walk-up the system. This should be connected directly to PMIC.		

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU_MISC0[STOP_MODE_CONFIG] bit (See PMU Memory Map/Register Definition). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop_mode signal. Blocks not described in the section below are unaffected by stop_mode.

If the stop_mode_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop_mode_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

Table 10-2. STOP mode configuration

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_pu	bypassed if not power gated.	bypassed if not power gated.
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration
LVDS clock I/O CLK1 and CLK2	off	off

10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for Arm core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

Table 10-3. Power saving design/architecture and power saving techniques

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
Arm Core Platform SRPG (Software)		√	
Arm Core Platform Power Gating		√	
Cortex-M4 Asymmetric multicore	√	√	√
VPU and GPU3D Power Gating	√[1]	√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (IPU, SW)			√
Architecture: L2 cache, Video / Audio / Graphics acceleration	√		
Architecture: PCIe, LVDS, HDMI, USB integration			√
Low Power DDR: LPDDR2, LV-DDR3			√

1. Applicable to use cases where GPU3D and VPU operation is not required.

10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the Arm domain and the GPU domain, as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See Temperature Monitor (TEMPMON) for further details on temperature monitor functions and programmability options.

10.4.2.3 Peripheral Power management

10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See Power Saving and Clock Frequency Change modes for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR

throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

10.4.2.3.2 IO power reduction

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs

- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible, specifically RGMII segment
- Disable all unused LVDS pads (ANALOG, MLB PHY, LDB)

10.4.2.4 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

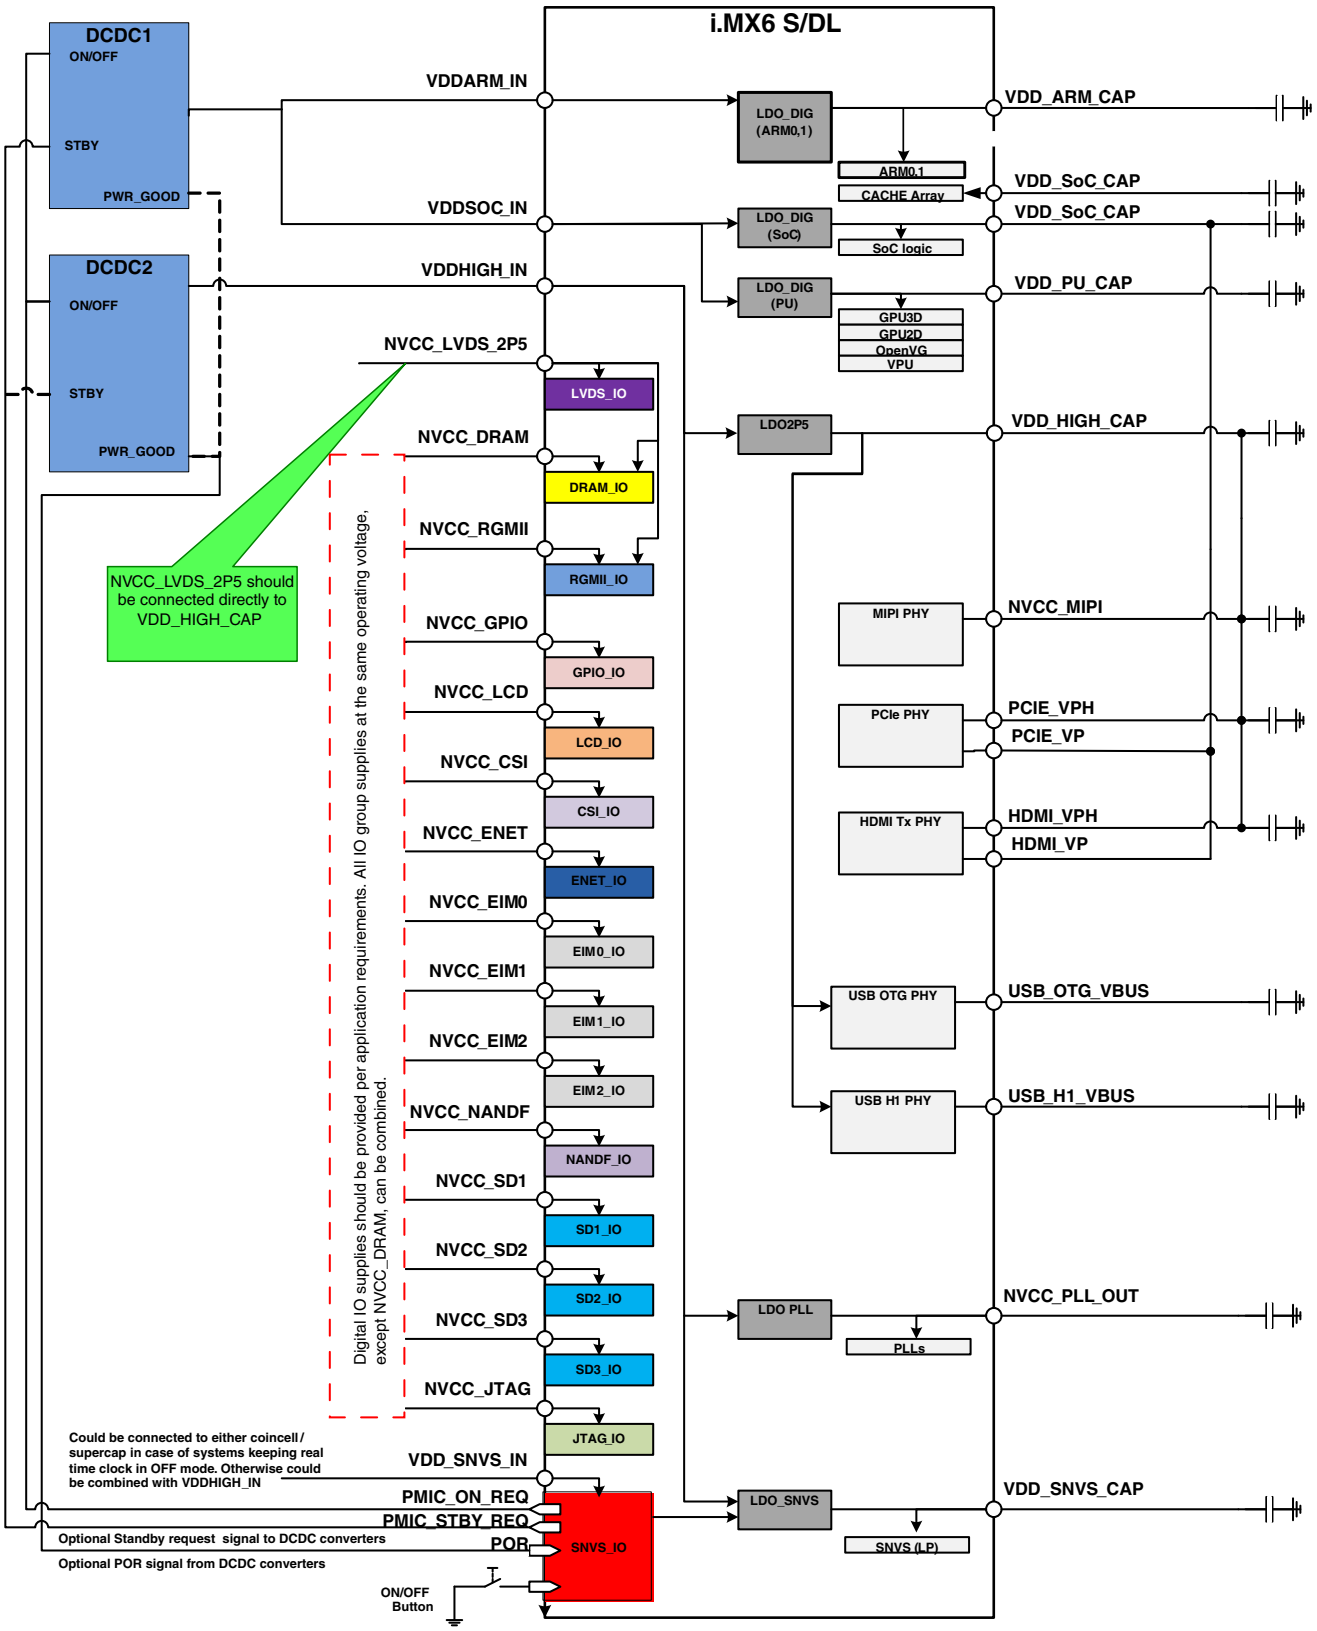

Figure 10-11. Supplying i.MX 6Solo/6DualLite power using integrated PMU

The scenario based on external programmable regulators is presented below: This scenario could be used in highly power optimized systems.

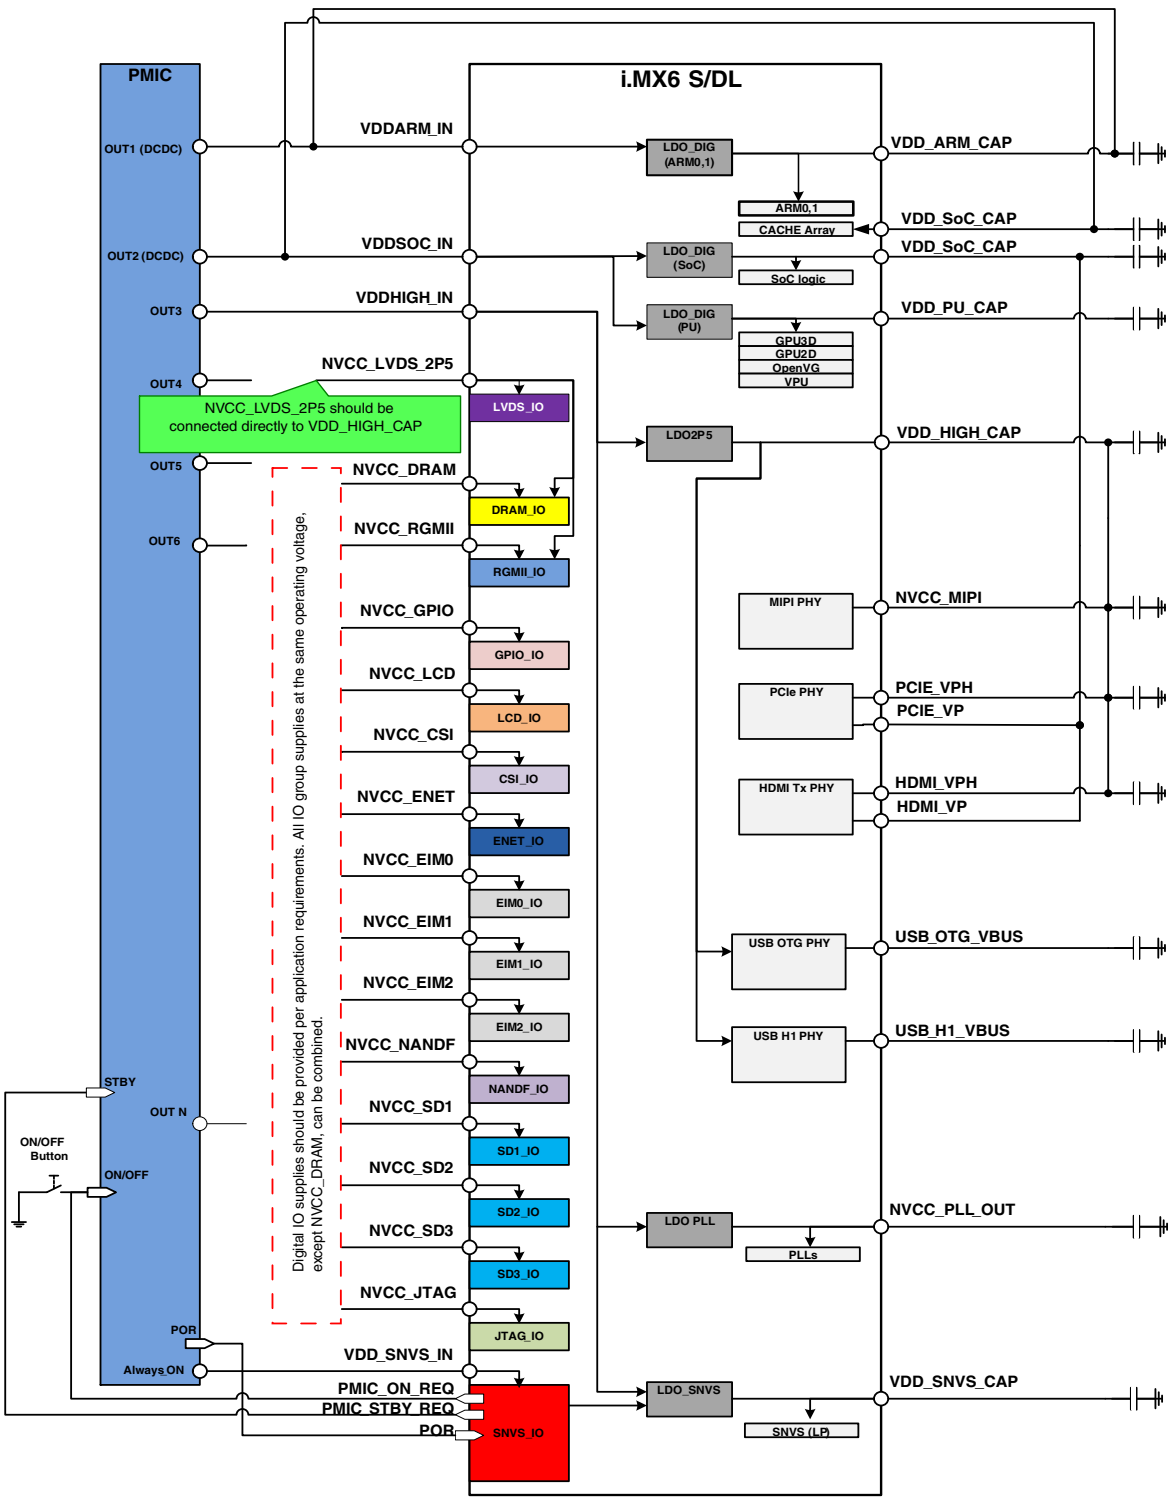

Figure 10-12. Supplying i.MX 6Solo/6DualLite Power Using External Programmable PMIC

10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The button is used to power On and Off the SoC using an always-on (e.g., coincell battery-backed) power domain.

- When the chip main power supply is Off, a button press greater in duration than 750 ms asserts an output signal to request power from a power IC to power up the SoC.
- When the chip main power supply is On, a button press between 750 ms and 5 seconds will send an interrupt to the core to request that software bring down the SoC safely. Software may respond to the interrupt by saving the processor state and then setting a control bit that requests to the power IC the removal of the main power supply.
- Button presses greater than 5 seconds, when the SoC is powered, results in a direct hardware power down request signal to the power IC without providing a software interrupt first. This long button press initiates a hardware-enforced mode which is applicable when software is unable to power Off the device.

The button is connected to input ONOFF and the power IC is connected the chip output PMIC_ON_REQ. The chip must have TEST_MODE deasserted. An always-On supply (e.g. coincell) is needed in the system for this feature.

Chapter 11
System Security

11.1 Overview

Security is a common requirement for platforms built using the chip, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the chip incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the chip security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the chip includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the chip security components.

- Cryptographic module with AES 128/256 symmetric algorithms, random number generator entropy source and NIST-validated DRBG, cryptographic key protection, run-time integrity checking.
- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A9 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.

- 16 Kbyte of on-chip Secure RAM
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- For DTCP (Digital Transmission Content Protection) adopters, DTCP functionality to support DTCP-MOST and DTCP-IP.
- 12 tamper pins supported
- Hardware Cryptographic Accelerators
  - Symmetric: AES-128, AES-192, AES-256, DES, 3DES, and ARC4
  - Hash Message Digest and HMAC: SHA-1, SHA-224, SHA-256, and MD-5
- True and Pseudo Random Number Generator

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual for i.MX 6Dual/6Quad and i.MX 6Solo/6DualLite*.

11.2 Central Security Unit (CSU)

11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privilges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- csu_sec_level for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the csu_sec_level signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

Table 11-1. Permission Access Table

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

11.3 Cryptographic Acceleration and Assurance Module (CAAM)

11.3.1 CAAM Overview

CAAM is a cryptographic acceleration device that accelerates block encryption algorithms, stream cipher algorithms, hashing algorithms, and random number generation. It has an integral DMA engine that allows CAAM to fetch its command programs, read input data and write the resulting output.

CAAM works with the SNVS to provide platform assurance features, including support for High Assurance Boot, detection of and response to potential tamper events, and shortterm and long-term protection of secret data such as public keypairs, Digital Rights Management keys and proprietary software.

CAAM provides the following features:

- Cryptographic acceleration of hashing, encryption and decryption
- Offloading of cryptographic functions via programmable command descriptor language
- Two independent queues for commands and results
- Register Bus Interface used for configuration, control and status
- DMA, including scatter/gather support for data
- Automatic short-term encryption/decryption of cryptographic keys
- Long-term protection of secret data via device-specific encryption keys

- Secure Memory for access-controlled protection of critical data, and automatic zeroization in the case of tampering
- Random Number Generation using a true random number generator and a NISTcompliant pseudo random number generator

11.4 Secure Non-Volatile Storage (SNVS)

11.4.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows CAAM use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS signals CAAM to erase sensitive data such as cryptographic keys, and sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

11.4.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD_SNVS_IN).

An always-ON power supply (coincell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

11.5 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides hardware acceleration for the cryptographic algorithms. The features of DCP are:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- Key selection from the SNVS, DCP internal key storage, or general memory
- Internal Memory for storing up to four AES-128 keys—when a key is written to a key slot it can be read only by the DCP AES-128 engine
- IP slave interface
- DMA

11.6 High-Assurance Boot (HAB)

The HAB, which is the high-assurance boot feature in the system boot ROM, detects and prevents the execution of unauthorized software (malware) during the boot sequence.

When the unauthorized software is permitted to gain control of the boot sequence, it can be used for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks, or for repurposing the platform. The unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from the USB connections or removable devices.

The HAB protects against unauthorized software by:

- Using digital signatures to recognize the authentic software. This enables you to boot the device to a known initial state and run the software signed by the device manufacturer.

11.7 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the Arm processor and the system bus. This enables program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. The System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to the IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary-scan) testing.

The SJC provides these security levels:

- The JTAG Disabled-JTAG use is permanently blocked.
- The No-Debug-All security sensitive JTAG features are permanently blocked.
- The Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- The JTAG Enabled-JTAG use is unrestricted.

The security levels are selected via the e-fuse configuration.

NOTE

For the final production hardware, the most secure and preferred method is to ensure that the JTAG interface is not pinned or routed out at all. The same applies to any other trace, diagnostic or test ports including SDP.

Chapter 12
ARM Cortex A9 MPCore Platform (ARM)

12.1 Overview

The Cortex-A9 Core Platform consists of an ARM®Cortex®-A9 MPCore processor, which includes a NEON co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 512 KB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a 2 / 3[1] x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

12.2 External Signals

The following table describes the external signals of ARM:

Table 12-1. ARM External Signals

Signal	Description	Pad	Mode	Direction
ARM_EVENTI	Input event signal	GPIO_5	ALT7	I

Table continues on the next page...

1. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

Table 12-1. ARM External Signals (continued)

Signal	Description	Pad	Mode	Direction
ARM_EVENTO	Output event signal	CSI0_PIXCLK	ALT7	O
ARM_TRACE00	Trace signal	CSI0_VSYNC	ALT7	O
ARM_TRACE01	Trace signal	CSI0_DAT4	ALT7	O
ARM_TRACE02	Trace signal	CSI0_DAT5	ALT7	O
ARM_TRACE03	Trace signal	CSI0_DAT6	ALT7	O
ARM_TRACE04	Trace signal	CSI0_DAT7	ALT7	O
ARM_TRACE05	Trace signal	CSI0_DAT8	ALT7	O
ARM_TRACE06	Trace signal	CSI0_DAT9	ALT7	O
ARM_TRACE07	Trace signal	CSI0_DAT10	ALT7	O
ARM_TRACE08	Trace signal	CSI0_DAT11	ALT7	O
ARM_TRACE09	Trace signal	CSI0_DAT12	ALT7	O
ARM_TRACE10	Trace signal	CSI0_DAT13	ALT7	O
ARM_TRACE11	Trace signal	CSI0_DAT14	ALT7	O
ARM_TRACE12	Trace signal	CSI0_DAT15	ALT7	O
ARM_TRACE13	Trace signal	CSI0_DAT16	ALT7	O
ARM_TRACE14	Trace signal	CSI0_DAT17	ALT7	O
ARM_TRACE15	Trace signal	CSI0_DAT18	ALT7	O
ARM_TRACE_CLK	Clock signal	CSI0_DATA_EN	ALT7	O
ARM_TRACE_CTL	Control signal	CSI0_MCLK	ALT7	O

12.3 Platform configuration

The Bus, Cortex A9 Core, and L2 Cache configuration options are contained in the following subsections.

Table 12-2. Cortex-A9 revision

Core	MP004-BU-50000-r2p10-0rel0
Neon	AT397-BU-50001- r2p0-00rel0
PL310	PL310-BU-00000-r3p2-00rel0

12.3.1 Platform and SCU configuration

Table 12-3. Cortex-A9 configuration

Option	Selected Value	Comments
MP_MODE	Yes	Multi-Processor mode
POWER_DOMAIN_WRAPPER	No	Wrappers to support power off of individual cores.
PTM_INTERFACE_PRESENT	Yes	Use PTM as part of Trace/Debug logic.
PARITY	Yes	Using RAM arrays which support parity.
CORE_NUM	2/1[1]	Number of cores
INT_NUM	128	Number of interrupts (SPIs) in GIC
ACP_PRESENT	No	Accelerator Coherency Port (ACP)
MASTER_NUM	2	Number of 64-bit AXI output master ports.

1. Depending on type of part - i.MX 6Solo, i.MXDualLite.

12.3.2 Core configuration

Table 12-4. Cortex-A9 Core configuration

Option	Selected Value	Comments
DCACHESIZE	32	L1 Data cache size
ICACHESIZE	32	L1 Instruction cache size
TLBSIZE	128	
JAZELLE_PRESENT	Yes	Providing ARM's Jazelle technology hardware extensions.
FPU_PRESENT	No	The FPU functions are provided by NEON, thus additional FPU cannot be used.
NEON_PRESENT	Yes	Use MPE, NEON Co-Processor and FPU
PRELOAD_ENGINE_PRESENT	No	May only be beneficial in Video processing.

12.3.3 PL310 L2 Cache configuration

Table 12-5. PL310 L2 Cache configuration

Option	Selected Value	Comments
Cache way size	32 KB	(For total of 512 KB L2 size)
Number of cache ways	16	Performance enhancement versus 8 ways
RAM latencies	4	
Data RAM banking	Yes	Significantly improves cache throughput

Table continues on the next page...

Table 12-5. PL310 L2 Cache configuration (continued)

Option	Selected Value	Comments
Slave port 1 present	Yes	
Master port 1 present	Yes	
Parity logic	Yes	For military / surveillance applications, and side ease the process of identify memory related issues.
Lockdown by master	Yes	Increase L2 optimization
Lockdown by line	Yes	Increase L2 optimization
AXI ID width	5	
Address filtering	No	Help in timing closure, not required for symmetric AXI bus connectivity scheme.
Speculative read	Yes	Performance boost, when used with CortexA9.
Size of L2 cache	512 KB	Size is implied by Cache-Size times cache-ways (i.e. 512 KB)

12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

12.3.5 Memory Parity error support

The i.MX 6Solo/6DualLite ARM Cortex A9 MPCore ™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on cores

- Low leakage of LP process
- C4 package

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.
- Separate voltage for L1 memories array is required to allow DVFS.
- On-chip power switches are not utilized by gating the power of the platform directly from the regulator.

12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow[2]

- Power down request
- Save core's essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation on all cores
- Enter WFI state
- Power Gating of all cores' and platform logic

Power Up flow[2]

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and cores from memory by Dormant mode routines.

12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

12.4.2 Clocks, frequency goals

2. Dormant mode implementation information, provided by ARM, is preliminary.

12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

12.4.2.3 Debug Clocks

The ARM platform contains several debug components that use different internal clock names, but are all derived from the same ahb_clk clock root. These clocks, listed with their default values, are as follows.

- Trace buffer (ETB) clock - 133 MHz
- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

12.5 Core Platform Sub-Blocks details

12.5.1 ARM Cortex A9 MPCore ™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore ™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore ™ processor in the chip consists of:

- Two (2) Cortex A9 processors in a cluster and a Snoop Control Unit (SCU) that can be used to ensure coherency within the cluster.

- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in Platform configuration.

12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore ™ Platform includes MPE per core.

12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
  - Up to 16 Software Generated Interrupts (SGIs)
  - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)

- Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs .
- Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more informtation, see ARM MPCORE Technical Reference Manual.

12.5.3.2 About the Interrupt Controller

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

12.5.3.3 Interrupt Controller Clock frequency

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

12.5.3.4 TrustZone support

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

12.5.4 Instruction and data caches (L1)

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

12.5.5 L2 Cache and controller (PL310)

The platform includes unified (data / instruction) L2 cache unit, based on the cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See Table 12-5 for more information.

12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 2 / 3[3] x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the System Debug chapter.

3. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIv5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolvement of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by all cores and resources.
2. Nx PTMs, where N is numbers of cores in the system.

12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state
- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See System Debug for more information on the CTI.

12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

Chapter 13
AHB to IP Bridge (AIPSTZ)

13.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

13.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

13.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 13-1. AIPSTZ Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

13.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has several separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, ... and n-*x* for AIPS-1, ... and AIPS-*x* respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to AIPSTZ Memory Map/Register Definition for more information.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

13.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

13.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

13.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ_MPRs), the Peripheral Access Control registers (AIPSTZ_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ_OPACRs) described in AIPSTZ Memory Map/Register Definition.

13.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

Table 13-2. Peripheral Access Configuration options

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec_config_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of Table 13-2. If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec_config_0 [7:0] = 8'b0011_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

Table 13-3. Security Levels

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your NXP representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu_sec_level[2:0]' corresponding to each peripheral X.

13.7 Off-Platform Peripherals Index

The off-platform peripherals index allocation is shown in the following table.

13.8 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
207_C000	Master Priviledge Registers (AIPSTZ1_MPR)	32	R/W	7700_0000h	13.8.1/554

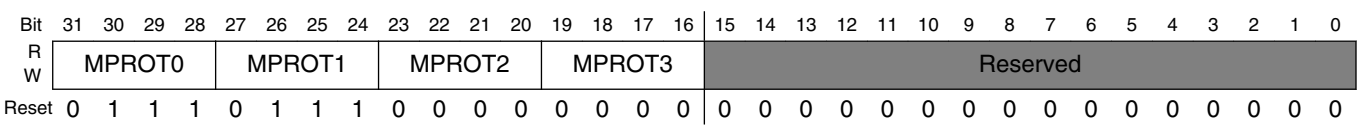
13.8.1 Master Priviledge Registers (AIPSTZx_MPR)

Each AIPSTZ_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in Table 13-6

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in the table below.

Table 13-6. MPROT Field

Bit	Field	Description
3	MBW	**Master Buffer Writes** - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	**Master Trusted for Reads** - This bit determines whether the master is trusted for read accesses.
1	MTW	**Master Trusted for Writes** - This bit determines whether the master is trusted for write accesses.
0	MPL	**Master Privilege Level** - This bit determines how the privilege level of the master is determined.



NOTE

The reset value is set to 0000_0000_7700_0000, which makes master 0 and master 1 (Arm CORE) the trusted masters. Trusted software can change the settings after reset.

Table 13-7. Master Index Allocation

Master Index	Master Name	Comments
Master 0	All masters excluding Arm core, SDMA and CAAM	Share the same number allocation.
Master 1	Arm CORE	
Master 2	CAAM	
Master 3	SDMA	
Master 4-15	Reserved	

Address: Base address + 0h offset

AIPSTZx_MPR field descriptions

Field	Description
31–28 MPROT0	Master 0 Priviledge, Buffer, Read, Write Control xxx0 **MPL0** — Accesses from this master are forced to user-mode (ips_supervisor_access is forced to zero) regardless of the hprot[1] access attribute. xxx1 **MPL1** — Accesses from this master are not forced to user-mode. The hprot[1] access attribute is used directly to determine ips_supervisor_access. xx0x **MTW0** — This master is not trusted for write accesses. xx1x **MTW1** — This master is trusted for write accesses. x0xx **MTR0** — This master is not trusted for read accesses.

13.8.2 Off-Platform Peripheral Access Control Registers (AIPSTZx_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in Table 13-8

Table 13-8. OPAC Field

Bit	Field	Description
3	BW	**Buffer Writes** - This bit determines whether write accesses to this peripheral are allowed to be buffered.[1]
2	SP	**Supervisor Protect** - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	**Write Protect** - This bit determines whether the peripheral allows write accesses.
0	TP	**Trusted Protect** - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

Chapter 14
AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

14.1 Overview

The AHB-to-APBH bridge provides the chip with an inexpensive peripheral attachment bus running on the AHB's HCLK. (The H in APBH denotes that the APB*H* is synchronous to HCLK.)

As shown in the figure below, the AHB-to-APBH bridge includes the AHB-to-APB PIO bridge for a memory-mapped I/O to the APB devices, as well as a central DMA facility for devices on this bus and a vectored interrupt controller for the Arm core. Each one of the APB peripherals, including the vectored interrupt controller, is documented in their respective chapters.

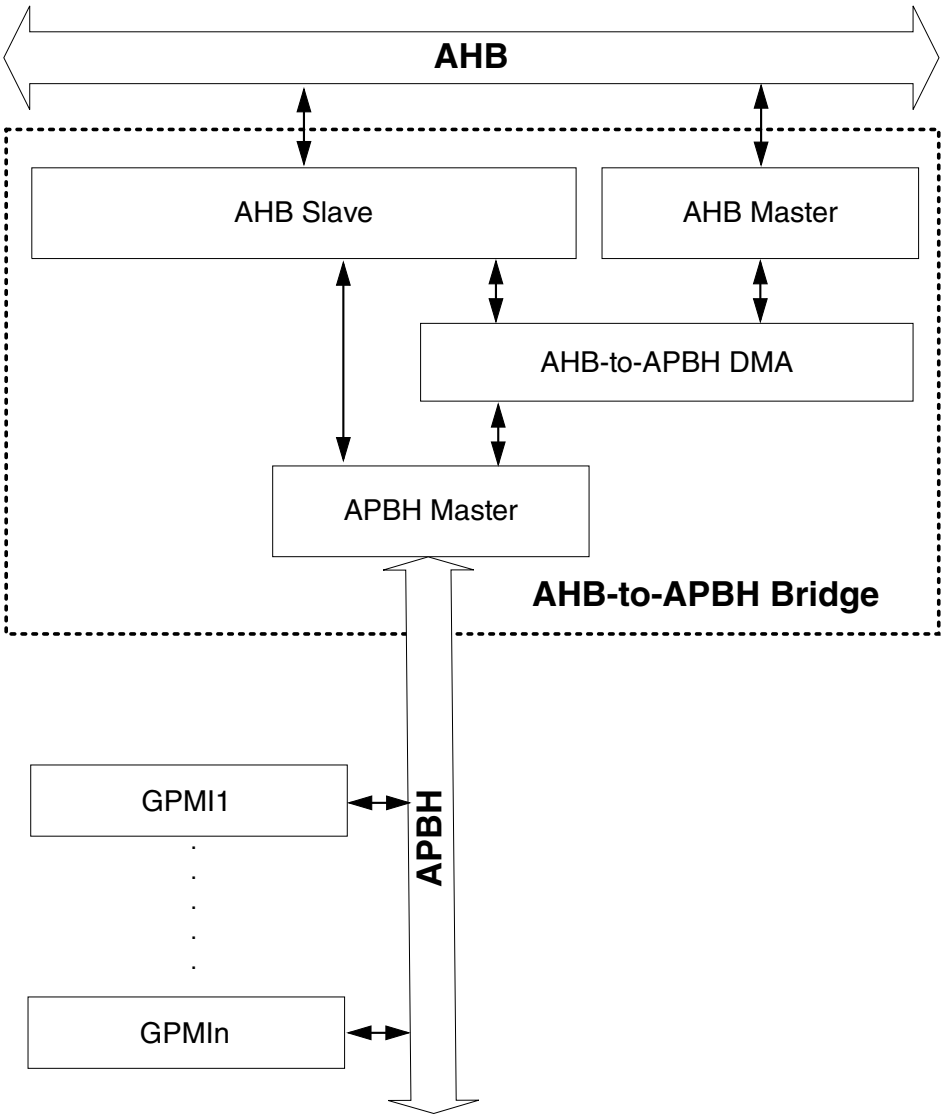

Figure 14-1. AHB-to-APBH Bridge DMA Block Diagram

The DMA controller uses the APBH bus to transfer read and write data to and from each peripheral. There is no separate DMA bus for these devices. Contention between the DMA's use of the APBH bus and the AHB-to-APB bridge functions' use of the APBH is mediated by an internal arbitration logic. For contention between these two units, the DMA is favored and the AHB slave will report "not ready" through its HREADY output until the bridge transfer can complete. The arbiter tracks repeated lockouts and inverts the priority, guaranteeing the Arm platform every fourth transfer on the APB.

14.2 Clocks

The table found here describes the clock sources for APBH. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 14-1. APBH Clocks

Clock name	Clock Root	Description
hclk	usdhc3_clk_root	Module clock

14.3 APBH DMA

The DMA supports four channels of DMA services, as shown in the following table. The shared DMA resource allows each independent channel to follow a simple chained command list. Command chains are built up using the general structure, as shown in Figure 14-2.

Table 14-2. APBH DMA channel assignments

APBH DMA Channel #	Usage
0	GPMI0
1	GPMI1
2	GPMI2
3	GPMI3

A single command structure or channel command word specifies a number of operations to be performed by the DMA in support of a given device. Thus, the Arm platform can set up large units of work, chaining together many DMA channel command words, pass them off to the DMA, and have no further concern for the device until the DMA completion interrupt occurs. The goal is to have enough intelligence in the DMA and the devices to keep the interrupt frequency from any device below 1 KHz (arrival intervals longer than 1 ms).

A single command structure can issue 32-bit PIO write operations to key registers in the associated device using the same APB bus and controls that it uses to write DMA data bytes to the device. For example, this allows a chain of operations to be issued to the GPMI controller to send NAND command bytes, address bytes, and data transfers where the command and the address structure is completely under software control, but the administration of that transfer is handled autonomously by the DMA. Each DMA structure can have 0–15 PIO words appended to it. The CMDPIOWORDS field, if non-zero, instructs the DMA engine to copy these words to the APB, beginning at the first register address offset for the peripheral and incrementing the register offset each cycle.

The DMA master generates only normal read/write transfers to the APBH. It does *not* generate set, clear, or toggle (SCT) transfers.

After any requested PIO words have been transferred to the peripheral, the DMA examines the two-bit command field in the channel command structure. Table 14-3 shows the four commands implemented by the DMA.

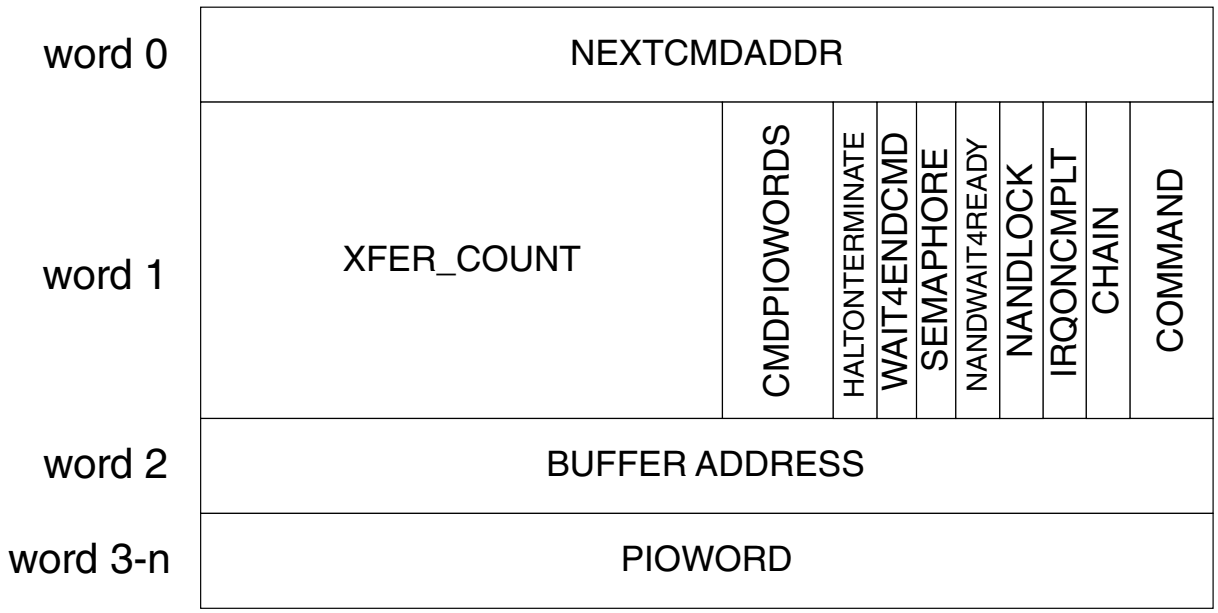

Figure 14-2. AHB-to-APBH Bridge DMA channel command structure

Table 14-3. APBH DMA commands

DMA Command	Usage
00	NO_DMA_XFER. Perform any requested PIO word transfers, but terminate the command before any DMA transfer.
01	DMA_WRITE. Perform any requested PIO word transfers, then perform a DMA transfer from the peripheral for the specified number of bytes.
10	DMA_READ. Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes.
11	DMA_SENSE. Perform any requested PIO word transfers, then perform a conditional branch to the next chained device. Follow the NEXTCMD_ADDR pointer if the peripheral sense is false. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is true. This command becomes a no-operation for any channel other than a GPMI channel.

DMA_WRITE operations copy data bytes to the system memory (on-chip RAM or SDRAM) from the associated peripheral.

DMA_READ operations copy data bytes to the APB peripheral from the system memory. The DMA engine contains a shared byte aligner that aligns bytes from system memory to or from the peripherals. Peripherals always assume little-endian-aligned data arrives or departs on their 32-bit APB. The DMA_READ transfer uses the BUFFER_ADDRESS word in the command structure to point to the DMA data buffer to be read by the DMA_READ command.

The NO_DMA_XFER command is used to write PIO words to a device without performing any DMA data byte transfers. This command is useful in such applications as activating the NAND devices CHECKSTATUS operation. The check status command reads a status byte from the NAND device, performs an XOR and MASK against an expected value supplied as part of the PIO transfer. Once the read check completes (see NAND Read Status Polling Example), the NO_DMA_XFER command completes. The result in the peripheral is that its sense line is driven by the results of the comparison. The sense flip-flop is only updated by CHECKSTATUS for the device that is executed. At some future point, the chain contains a DMA command structure with the fourth and final command value, that is, the DMA_SENSE command.

As each DMA command completes, it triggers the DMA to load the next DMA command structure in the chain. The normal flow list of DMA commands is found by following the NEXTCMD_ADDR pointer in the DMA command structure. The DMA_SENSE command uses the DMA buffer pointer word of the command structure to point to an alternate DMA command structure chain or list. The DMA_SENSE command examines the sense line of the associated peripheral. If the sense line is false, then the DMA follows the standard list found whose next command is found from the pointer in the NEXTCMD_ADDR word of the command structure. If the sense line is true, then the DMA follows the alternate list whose next command is found from the pointer in the DMA Buffer Pointer word of the DMA_SENSE command structure (see Figure 14-2). The sense command ignores the CHAIN bit, so that both pointers must be valid when the DMA comes to a sense command.

If the wait-for-end-command bit (WAIT4ENDCMD) is set in a command structure, the DMA channel waits for the device to signal completion of a command by toggling the endcmd signal before proceeding to load and execute the next command structure. Then, if DECREMENT_SEMAPHORE is set, the semaphore is decremented after the end command is seen.

A detailed bit-field view of the DMA command structure is shown in the following table, which shows a field that specifies the number of bytes to be transferred by this DMA command. The transfer-count mechanism is duplicated in the associated peripheral, either as an implied or as a specified count in the peripheral.

Table 14-4. DMA channel command word in system memory

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
NEXT_COMMAND_ADDRESS																															

Table continues on the next page...

Table 14-4. DMA channel command word in system memory (continued)

Number DMA Bytes to Transfer	Number PIO Words to Write				HALTONTERMINATE	WAIT4ENDCMD	DECREMENT SEMAPHORE	NANDwAIT4READY	NANDLOCK	IRQ_COMPLETE	CHAIN	COMMAND	
DMA Buffer or Alternate CCW													
Zero or More PIO Words to Write to the Associated Peripheral Starting at its Base Address on the APBH Bus													

Figure 14-2 also shows the CHAIN bit in bit 2 of the second word of the command structure. This bit is set to 1, if the NEXT_COMMAND_ADDRESS contains a pointer to another DMA command structure. If a null pointer (0) is loaded into the NEXT_COMMAND_ADDRESS, it is not detected by the DMA hardware. Only the CHAIN bit indicates whether a valid list exists beyond the current structure.

If the IRQ_COMPLETE bit is set in the command structure, then the last act of the DMA before loading the next command is to set the interrupt-status bit corresponding to the current channel. The sticky interrupt request bit in the DMA CSR remains set until cleared by the software. It can be used to interrupt the Arm platform.

The NAND_LOCK bit is monitored by the DMA channel arbiter. Once a NAND channel (from channel 0 to channel 3) succeeds in the arbiter with its NAND_LOCK bit set, then the arbiter ignores the other NAND channels until a command is completed in which the NAND_LOCK is not set. Notice that the semantic here is that the NAND_LOCK state is to limit scheduling of a non-locked DMA. A DMA channel can go from unlocked to locked in the arbiter at the beginning of a command when the NAND_LOCK bit is set. When the last DMA command of an atomic sequence is completed, the lock should be removed. To accomplish this, the last command does not have the NAND_LOCK bit. It is still locked in the atomic state within the arbiter when the command starts, so that it is the only NAND command that can be executed. At the end, it drops from the atomic state within the arbiter.

The NAND_WAIT4READY bit also has a special use for GPMI channels (from channel 0 to channel 3), i.e., the NAND device channels. The GPMI peripheral supplies a sample of the ready line from the NAND device. This ready value is used to hold off of a command with this bit set until the ready line is asserted to 1. Once the arbiter sees a command with a wait-for-ready set, it holds off that channel until ready is asserted.

Receiving an IRQ for HALTONTERMINATE (HOT) is a feature in the APBH DMA descriptor that allows GPMI to signal to the DMA engine that an error has occurred. If a command is stalled due to an error, a HOT signal is sent from the peripheral to the DMA engine and causes an IRQ after terminating the DMA descriptor being executed.

Therefore, it is recommended that software use this signal as follows:

- Always set HALTONTERMINATE to 1 in a DMA descriptor. That way, if a peripheral signals HOT, the transfer will end, leaving the peripheral block and the DMA engine synchronized (but at the end of a command).
- When an IRQ from an APBH channel is received, and the IRQ is determined to be due to an error (as opposed to an IRQONCOMPLETE interrupt) the software should:
  - Reset the channel.
  - Determine the error from error reporting in the peripheral block, then manage the error in the peripheral that is attached to that channel in whatever appropriate way exists for that device (software recovery, device reset, block reset, etc).

Each channel has an eight-bit counting semaphore that controls whether it is in the idle state. When the semaphore is non-zero, the channel is ready to run, process commands and perform DMA transfers. Whenever a command finishes its DMA transfer, it checks the DECREMENT_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by the software. When the semaphore goes to non-zero and the channel is in its idle state, then it uses the value in the APBH_CHn_NXTCMDAR register (next command address register) to fetch a pointer to the next command to process.

NOTE

This is a double indirect case. This method allows the software to append to a running command list under the protection of the counting semaphore.

To start processing the first time, software creates the command list to be processed. It writes the address of the first command into the APBH_CHn_NXTCMDAR register, and then writes 1 to the counting semaphore in APBH_CHn_SEMA. The DMA channel loads APBH_CHn_CURCMDAR register and then enters the normal state machine processing for the next command. When the software writes a value to the counting semaphore, it is added to the semaphore count by hardware, protecting the case where both hardware and software are trying to change the semaphore on the same clock edge.

Software can examine the value of APBH_CHn_CURCMDAR at any time to determine the location of the command structure currently being processed.

14.4 NAND Read Status Polling Example

The following figure shows a more complicated scenario.

This subset of a NAND device workload shows that the first two command structures are used during the data-write phase of an NAND device write operation (CLE and ALE transfers omitted for clarity).

- After writing the data, one must wait until the NAND device status register indicates that the write charge has been transferred. This is built into the workload using a check status command in the NAND in a loop created from the next two DMA command structures.
- The NO_DMA_TRANSFER command is shown here performing the read check, followed by a DMA_SENSE command to branch the DMA command structure list, based on the status of a bit in the external NAND device.

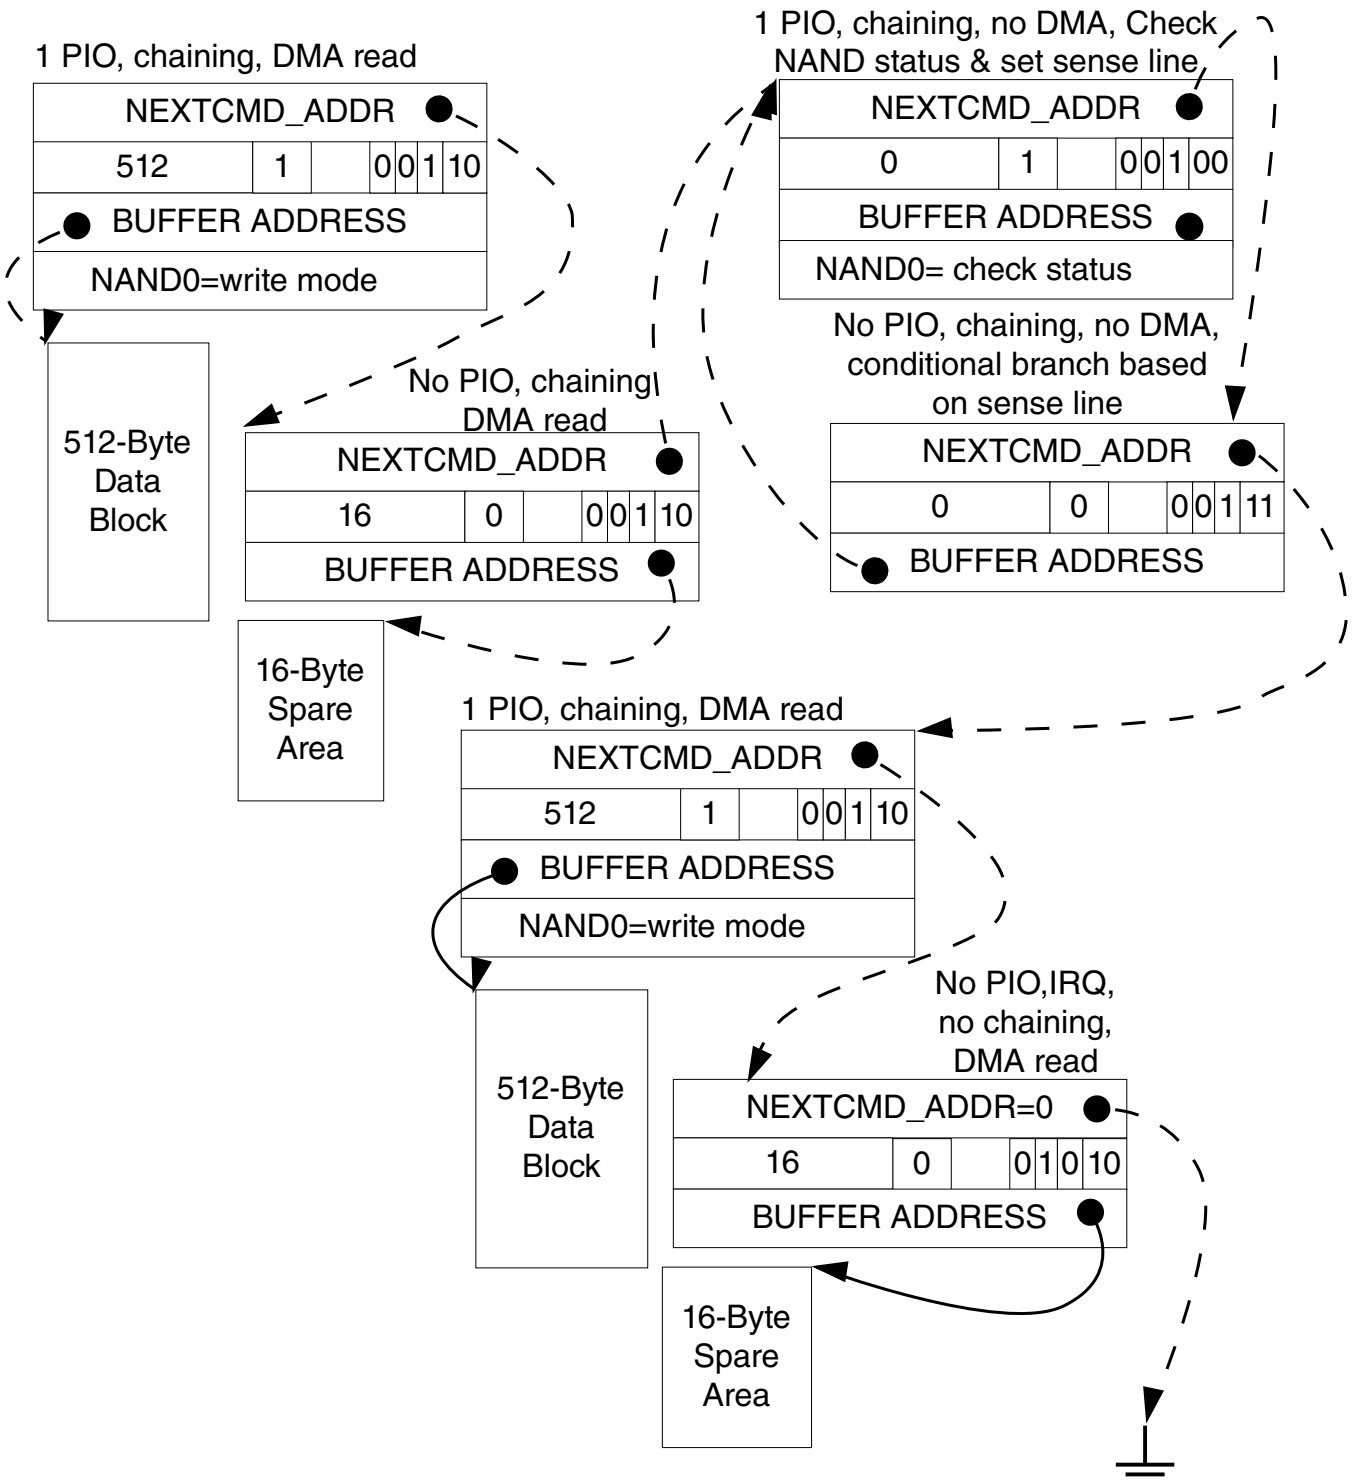

Figure 14-3. AHB-to-APBH Bridge DMA NAND Read Status Polling with DMA Sense Command

The example in the above figure shows the workload continuing immediately to the next NAND page transfer. However, one could perform a second sense operation to see if an error has occurred after the write. One could then point the sense command alternate branch at a NO_DMA_XFER command with the interrupt bit set. If the CHAIN bit is not

set on this failure branch, then the Arm platform is interrupted immediately, and the channel process is also immediately terminated in the presence of a workload-detected NAND error bit.

Note that each word of the three-word DMA command structure corresponds to a PIO register of the DMA that is accessible on the APBH bus. Normally, the DMA copies the next command structure onto these registers for processing at the start of each command by following the value of the pointer previously loaded into the NEXTCMD_ADDR register.

To start DMA processing for the first command, initialize the PIO registers of the desired channel, as follows:

- First, load the next command address register with a pointer to the first command to be loaded.
- Then, write 1 to the counting semaphore register. This causes the DMA to schedule the targeted channel for the DMA command structure load, just as if it had finished its previous command.

14.5 APBH Memory Map/Register Definition

APBH Hardware Register Format Summary

APBH memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
11_0000	AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0)	32	R/W	E000_0000h	14.5.1/586

14.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0*n*)

The APBH CTRL 0 provides overall control of the AHB to APBH bridge and DMA.

This register contains module softreset, clock gating, channel clock gating/freeze bits.

Address: 11_0000h base + 0h offset + (4d × i), where i=0d to 3d

APBH_CTRL0*n* field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal APBH DMA operation. Set this bit to one (default) to disable clocking with the APBH DMA and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the APBH DMA block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 AHB_BURST8_EN	Set this bit to one (default) to enable AHB 8-beat burst. Set to zero to disable 8-beat burst on AHB interface.
28 APB_BURST_EN	Set this bit to one to enable apb master do a continous transfers when a device request a burst dma. Set to zero will treat a burst dma request as 4/8 individual requests.
27–16 RSVD0	This field is reserved. Reserved, always set to zero.
CLKGATE_CHANNEL	These bits must be set to zero for normal operation of each channel. When set to one they gate off the individual clocks to the channels. 0x0001 **NAND0** — 0x0002 **NAND1** — 0x0004 **NAND2** — 0x0008 **NAND3** — 0x0010 **NAND4** — 0x0020 **NAND5** — 0x0040 **NAND6** — 0x0080 **NAND7** — 0x0100 **SSP** —

14.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1*n*)

The APBH CTRL one provides overall control of the interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```
                    BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0);  // use bitfield write macro
                    BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;      // or, assign to register
struct's bitfield
```

Address: 11_0000h base + 10h offset + (4d × i), where i=0d to 3d

Field	Description
29 CH13_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 13.
28 CH12_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 12.
27 CH11_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 11.
26 CH10_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 10.
25 CH9_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 9.
24 CH8_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 8.
23 CH7_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 7.
22 CH6_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 6.
21 CH5_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 5.
20 CH4_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 4.
19 CH3_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 3.
18 CH2_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 2.

Table continues on the next page...

APBH_CTRL1*n* field descriptions (continued)

Field	Description
17 CH1_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 1.
16 CH0_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 0.
15 CH15_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
14 CH14_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
13 CH13_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
12 CH12_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
11 CH11_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
10 CH10_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
9 CH9_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
8 CH8_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
7 CH7_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 7. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
6 CH6_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 6. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

Table continues on the next page...

APBH_CTRL1*n* field descriptions (continued)

Field	Description
5 CH5_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 5. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
4 CH4_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 4. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
3 CH3_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 3. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
2 CH2_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 2. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
1 CH1_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 1. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
0 CH0_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 0. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

14.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2*n*)

The APBH CTRL 2 provides channel error interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

EXAMPLE

```
                    BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0);  // use bitfield write macro
                    BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;      // or, assign to register
struct's bitfield
```

Field	Description
16 CH0_ERROR_STATUS	Error status bit for APBX DMA Channel 0. Valid when corresponding Error IRQ is set. 1 - AHB bus error 0 - channel early termination. 0x0 **TERMINATION** — An early termination from the device causes error IRQ. 0x1 **BUS_ERROR** — An AHB bus error causes error IRQ.
15 CH15_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
14 CH14_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
13 CH13_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
12 CH12_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
11 CH11_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
10 CH10_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
9 CH9_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
8 CH8_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
7 CH7_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 7. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
6 CH6_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 6. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
5 CH5_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 5. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
4 CH4_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 4. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
3 CH3_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 3. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
2 CH2_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 2. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.

Table continues on the next page...

APBH_CTRL2*n* field descriptions (continued)

Field	Description
1 CH1_ERROR_ IRQ	Error interrupt status bit for APBX DMA Channel 1. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.
0 CH0_ERROR_ IRQ	Error interrupt status bit for APBX DMA Channel 0. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to Arm.

14.5.4 AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL*n*)

The APBH CHANNEL CTRL provides reset/freeze control of each DMA channel. This register contains individual channel reset/freeze bits.

Address: 11_0000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

29–28 CH14	This field is reserved. Reserved.
27–26 CH13	This field is reserved. Reserved.
25–24 CH12	This field is reserved. Reserved.
23–22 CH11	This field is reserved. Reserved.

Table continues on the next page...

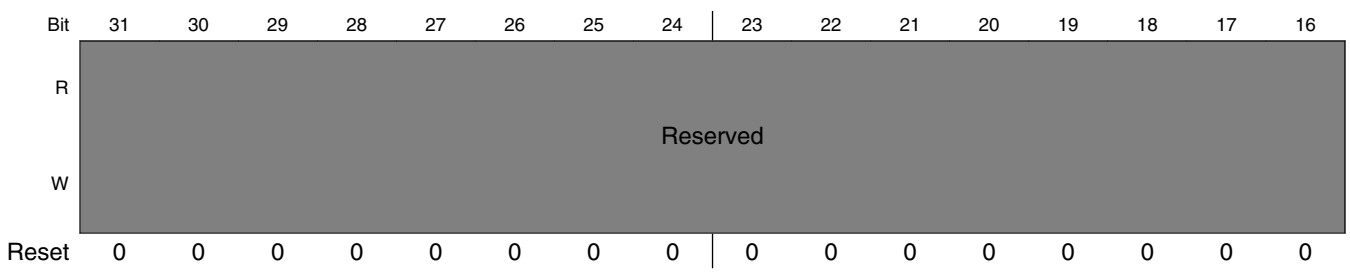
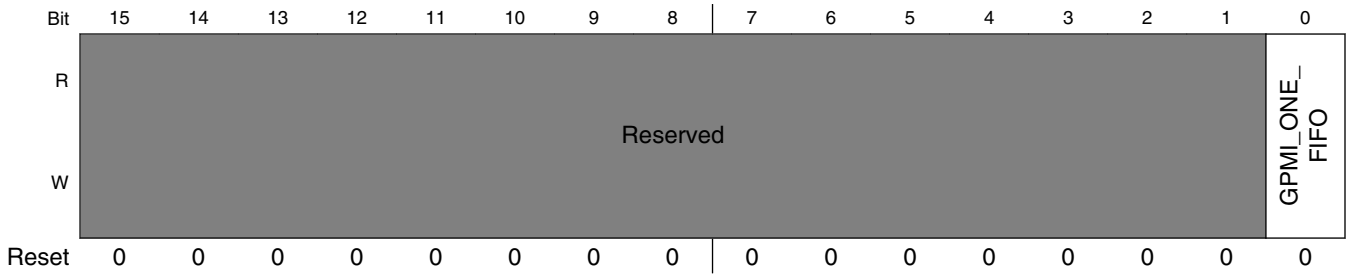
APBH_DMA_BURST_SIZE field descriptions (continued)



Field	Description
21–20 CH10	This field is reserved. Reserved.
19–18 CH9	This field is reserved. Reserved.
17–16 CH8	DMA burst size for SSP. 0x0 **BURST0** — 0x1 **BURST4** — 0x2 **BURST8** —
15–14 CH7	DMA burst size for GPMI channel 7. Do not change. GPMI only support burst size 4.
13–12 CH6	DMA burst size for GPMI channel 6. Do not change. GPMI only support burst size 4.
11–10 CH5	DMA burst size for GPMI channel 5. Do not change. GPMI only support burst size 4.
9–8 CH4	DMA burst size for GPMI channel 4. Do not change. GPMI only support burst size 4.
7–6 CH3	DMA burst size for GPMI channel 3. Do not change. GPMI only support burst size 4.
5–4 CH2	DMA burst size for GPMI channel 2. Do not change. GPMI only support burst size 4.
3–2 CH1	DMA burst size for GPMI channel 1. Do not change. GPMI only support burst size 4.
CH0	DMA burst size for GPMI channel 0. Do not change. GPMI only support burst size 4.



14.5.7 AHB to APBH DMA Debug Register (APBH_DEBUG)

This register is for debug purpose.

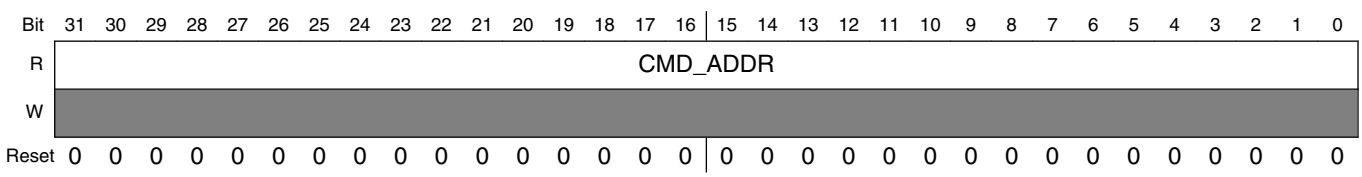
The debug register is for internal use only. Not recommend for customer useage.

Address: 11_0000h base + 60h offset = 11_0060h

APBH_DEBUG field descriptions

Field	Description
31–1 -	This field is reserved. Reserved, always set to zero.
0 GPMI_ONE_FIFO	Set to 0ne and the 8 GPMI channels will share the DMA FIFO, and when set to zero, the 8 GPMI channels will use its own DMA FIFO.

14.5.8 APBH DMA Channel n Current Command Address Register (APBH_CH*n*_CURCMDAR)



The APBH DMA channel n current command address register points to the multiword command that is currently being executed. Commands are threaded on the command address.

APBH DMA Channel n is controlled by a variable sized command structure. This register points to the command structure currently being executed.

EXAMPLE

```
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR_RD(0);              // read the whole
register, since there is only one field
pCurCmd = (apbh_chn_cmd_t *) BF_RDn(APBH_CHn_CURCMDAR, 0, CMD_ADDR);  // or, use multi-
register bitfield read macro
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR(0).CMD_ADDR;        // or, assign from
bitfield of indexed register's struct
```

Address: 11_0000h base + 100h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_CURCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to command structure currently being processed for channel n.

14.5.9 APBH DMA Channel n Next Command Address Register (APBH_CH*n*_NXTCMDAR)

The APBH DMA Channel n Next Command Address register contains the address of the next multiword command to be executed. Commands are threaded on the command address. Set CHAIN to 1 in the DMA command word to process command lists.

APBH DMA Channel n is controlled by a variable sized command structure. Software loads this register with the address of the first command structure to process and increments the Channel n semaphore to start processing. This register points to the next command structure to be executed when the current command is completed.

EXAMPLE

```
APBH_CHn_NXTCMDAR_WR(0, (reg32_t) pCommandTwoStructure);         // write the entire
register, since there is only one field
BF_WRn(APBH_CHn_NXTCMDAR, 0, (reg32_t) pCommandTwoStructure);       // or, use multi-
register bitfield write macro
APBH_CHn_NXTCMDAR(0).CMD_ADDR = (reg32_t) pCommandTwoStructure;  // or, assign to bitfield
of indexed register's struct
```

Address: 11_0000h base + 110h offset + (112d × i), where i=0d to 15d

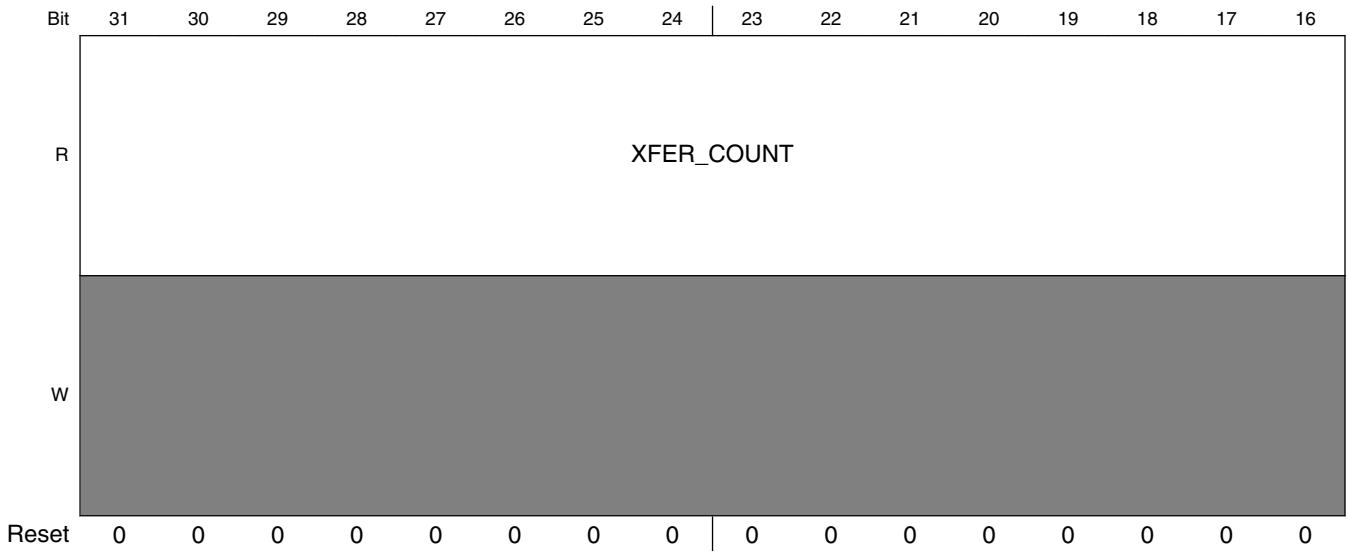
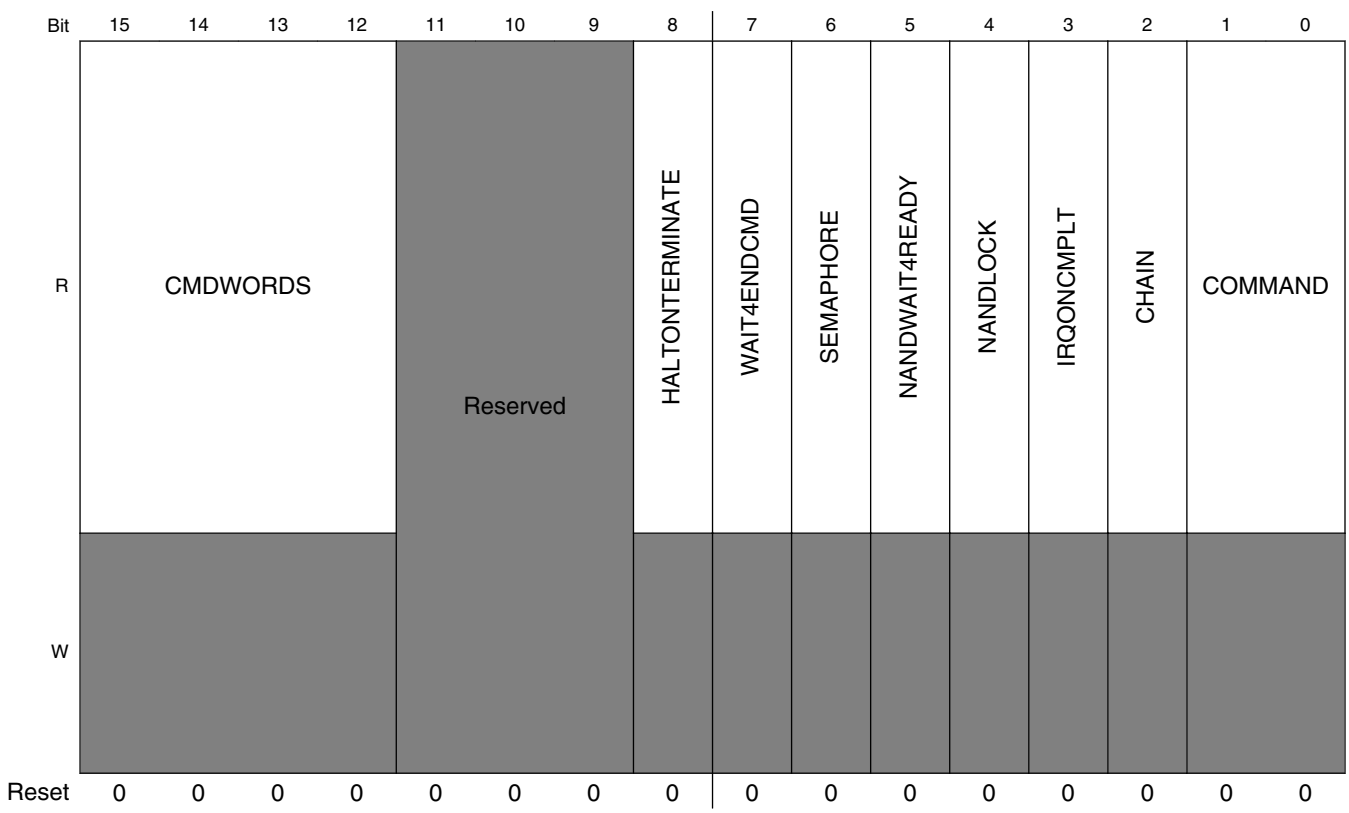
APBH_CH*n*_NXTCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to next command structure for channel n.

14.5.10 APBH DMA Channel n Command Register (APBH_CH*n*_CMD)



The APBH DMA Channel n command register specifies the DMA transaction to perform for the current command chain item.



The command register controls the overall operation of each DMA command for this channel. It includes the number of bytes to transfer to or from the device, the number of APB PIO command words included with this command structure, whether to interrupt at command completion, whether to chain an additional command to the end of this one and whether this transfer is a read or write DMA transfer.

EXAMPLE

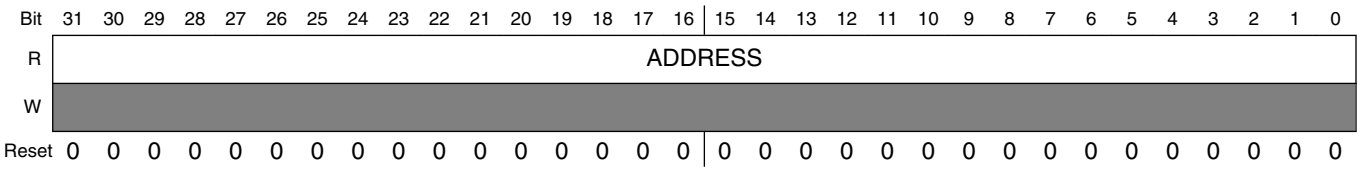
```
apbh_chn_cmd_t  dma_cmd;
dma_cmd.XFER_COUNT = 512;                                    // transfer 512 bytes
dma_cmd.COMMAND = BV_APBH_CHn_CMD_COMMAND__DMA_WRITE;  // transfer to system memory from
peripheral device
dma_cmd.CHAIN = 1;                                           // chain an additional command
structure on to the list
dma_cmd.IRQONCMPLT = 1;                                      // generate an interrupt on
completion of this command structure
```

Address: 11_0000h base + 120h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_CMD field descriptions

Field	Description
31–16 XFER_COUNT	This field indicates the number of bytes to transfer to or from the appropriate PIO register in the GPMI0 device. A value of 0 indicates a 64 KBytes transfer.
15–12 CMDWORDS	This field indicates the number of command words to send to the GPMI0, starting with the base PIO address of the GPMI0 control register and incrementing from there. Zero means transfer NO command words
11–9 -	This field is reserved. Reserved, always set to zero.
8 HALTONTERMINATE	A value of one indicates that the channel will immeditately terminate the current descriptor and halt the DMA channel if a terminate signal is set. A value of 0 will still cause an immediate terminate of the channel if the terminate signal is set, but the channel will continue as if the count had been exhausted, meaning it will honor IRQONCMPLT, CHAIN, SEMAPHORE, and WAIT4ENDCMD.
7 WAIT4ENDCMD	A value of one indicates that the channel will wait for the end of command signal to be sent from the APBH device to the DMA before starting the next DMA command.
6 SEMAPHORE	A value of one indicates that the channel will decrement its semaphore at the completion of the current command structure. If the semaphore decrements to zero, then this channel stalls until software increments it again.
5 NANDWAIT4READY	A value of one indicates that the NAND DMA channel will will wait until the NAND device reports "ready" before executing the command. It is ignored for non-NAND DMA channels.
4 NANDLOCK	A value of one indicates that the NAND DMA channel will remain "locked" in the arbiter at the expense of other NAND DMA channels. It is ignored for non-NAND DMA channels.
3 IRQONCMPLT	A value of one indicates that the channel will cause the interrupt status bit to be set upon completion of the current command, i.e. after the DMA transfer is complete.
2 CHAIN	A value of one indicates that another command is chained onto the end of the current command structure. At the completion of the current command, this channel will follow the pointer in APBH_CHn_CMDAR to find the next command.
COMMAND	This bitfield indicates the type of current command: 0x0 **NO_DMA_XFER** — Perform any requested PIO word transfers but terminate command before any DMA transfer. 0x1 **DMA_WRITE** — Perform any requested PIO word transfers and then perform a DMA transfer from the peripheral for the specified number of bytes. 0x2 **DMA_READ** — Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes. 0x3 **DMA_SENSE** — Perform any requested PIO word transfers and then perform a conditional branch to the next chained device. Follow the NEXCMD_ADDR pointer if the perpheral sense is true. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is false.

14.5.11 APBH DMA Channel n Buffer Address Register (APBH_CH*n*_BAR)



The APBH DMA Channel n buffer address register contains a pointer to the data buffer for the transfer. For immediate forms, the data is taken from this register. This is a byte address which means transfers can start on any byte boundary.

This register holds a pointer to the data buffer in system memory. After the command values have been read into the DMA controller and the device controlled by this channel, then the DMA transfer will begin, to or from the buffer pointed to by this register.

EXAMPLE

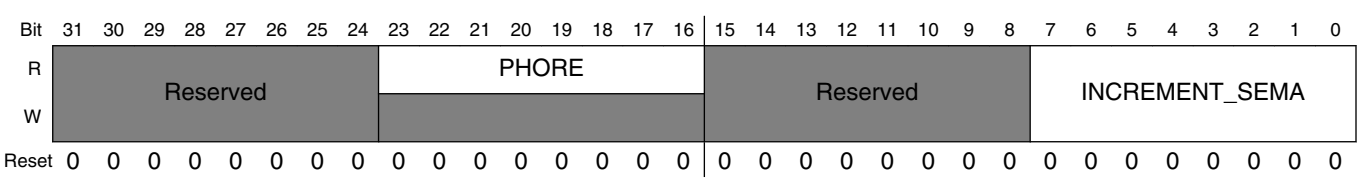
```
apbh_chn_bar_t  dma_data;
dma_data.ADDRESS = (reg32_t) pDataBuffer;
```

Address: 11_0000h base + 130h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_BAR field descriptions

Field	Description
ADDRESS	Address of system memory buffer to be read or written over the AHB bus.

14.5.12 APBH DMA Channel n Semaphore Register (APBH_CH*n*_SEMA)



The APBH DMA Channel n semaphore register is used to synchronize the Arm platform instruction stream and the DMA chain processing state.

Each DMA channel has an 8 bit counting semaphore that is used to synchronize between the program stream and and the DMA chain processing. DMA processing continues until the DMA attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DMA channel is stalled until software increments the semaphore count.

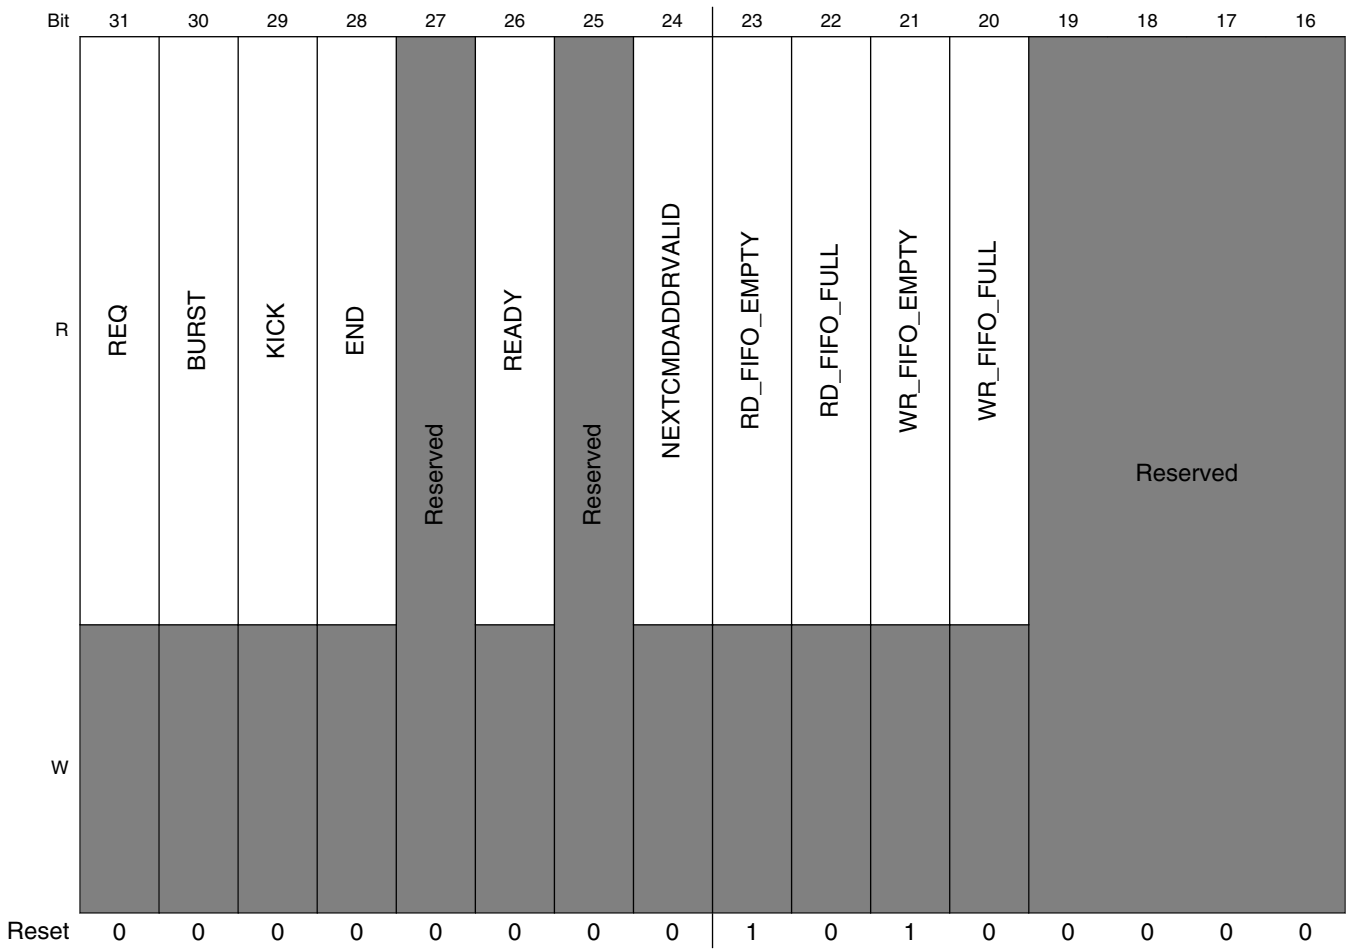
EXAMPLE

```
BF_WR(APBH_CHn_SEMA, 0, INCREMENT_SEMA, 2);     // increment semaphore by two
current_sema = BF_RD(APBH_CHn_SEMA, 0, PHORE);  // get instantaneous value
```

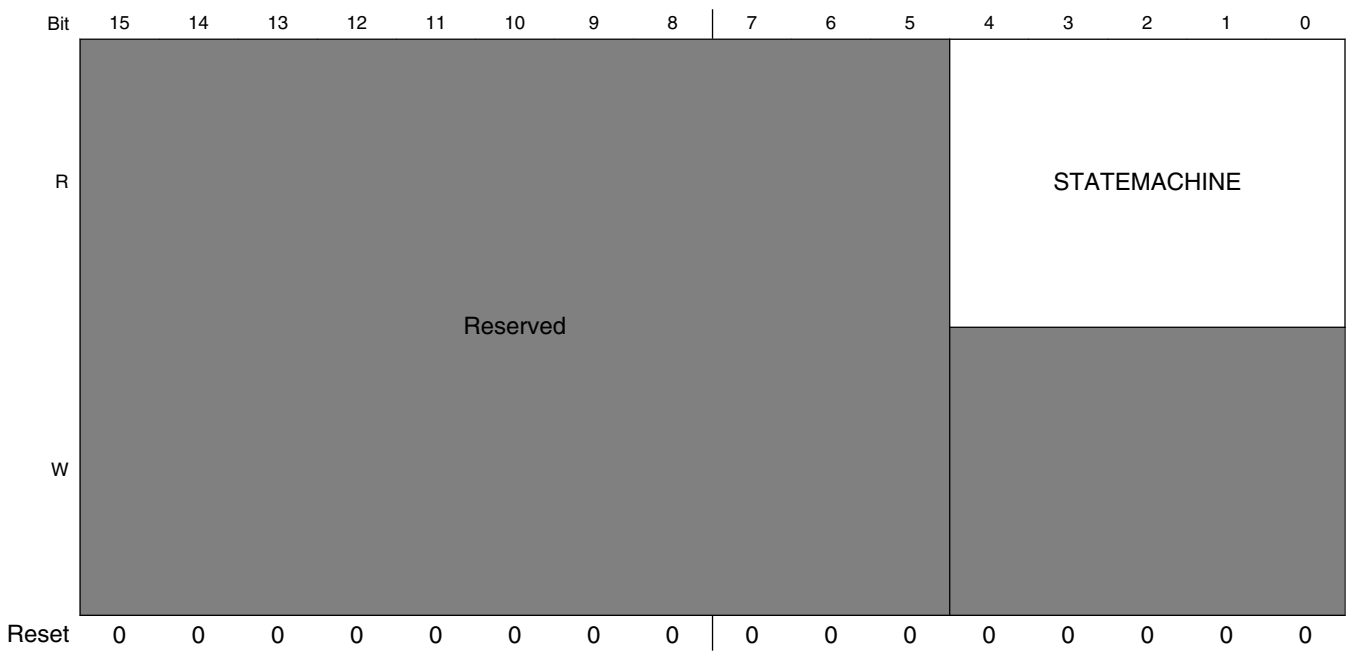
Address: 11_0000h base + 140h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_SEMA field descriptions

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 PHORE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
INCREMENT_ SEMA	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DMA hardware substracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DMA channel decrements the count on the same clock, then the count is incremented by a net one.



14.5.13 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG1)



This register gives debug visibility into the APBH DMA Channel n state machine and controls.

This register allows debug visibility of the APBH DMA Channel n.

APBH Memory Map/Register Definition

Address: 11_0000h base + 150h offset + (112d × i), where i=0d to 15d

APBH_CH*n*_DEBUG1 field descriptions

Field	Description
31 REQ	This bit reflects the current state of the DMA Request Signal from the APB device
30 BURST	This bit reflects the current state of the DMA Burst Signal from the APB device
29 KICK	This bit reflects the current state of the DMA Kick Signal sent to the APB Device
28 END	This bit reflects the current state of the DMA End Command Signal sent from the APB Device
27 SENSE	This field is reserved. This bit is reserved for this DMA Channel and always reads 0.
26 READY	This bit is reserved for this DMA Channel and always reads 0.
25 LOCK	This field is reserved. This bit is reserved for this Channel and always reads 0.
24 NEXTCMDADDRVALID	This bit reflects the internal bit which indicates whether the channel's next command address is valid.
23 RD_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Read FIFO Empty signal.
22 RD_FIFO_FULL	This bit reflects the current state of the DMA Channel's Read FIFO Full signal.
21 WR_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Write FIFO Empty signal.
20 WR_FIFO_FULL	This bit reflects the current state of the DMA Channel's Write FIFO Full signal.
19–5 RSVD1	This field is reserved. Reserved
STATEMACHINE	PIO Display of the DMA Channel n state machine state. 0x00 **IDLE** — This is the idle state of the DMA state machine. 0x01 **REQ_CMD1** — State in which the DMA is waiting to receive the first word of a command. 0x02 **REQ_CMD3** — State in which the DMA is waiting to receive the third word of a command. 0x03 **REQ_CMD2** — State in which the DMA is waiting to receive the second word of a command. 0x04 **XFER_DECODE** — The state machine processes the descriptor command field in this state and branches accordingly. 0x05 **REQ_WAIT** — The state machine waits in this state for the PIO APB cycles to complete. 0x06 **REQ_CMD4** — State in which the DMA is waiting to receive the fourth word of a command, or waiting to receive the PIO words when PIO count is greater than 1. 0x07 **PIO_REQ** — This state determines whether another PIO cycle needs to occur before starting DMA transfers. 0x08 **READ_FLUSH** — During a read transfers, the state machine enters this state waiting for the last bytes to be pushed out on the APB. 0x09 **READ_WAIT** — When an AHB read request occurs, the state machine waits in this state for the AHB transfer to complete. 0x0C **WRITE** — During DMA Write transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel. 0x0D **READ_REQ** — During DMA Read transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.

Table continues on the next page...

APBH_CH*n*_DEBUG1 field descriptions (continued)

Field	Description
	0x0E **CHECK_CHAIN** — Upon completion of the DMA transfers, this state checks the value of the Chain bit and branches accordingly. 0x0F **XFER_COMPLETE** — The state machine goes to this state after the DMA transfers are complete, and determines what step to take next. 0x14 **TERMINATE** — When a terminate signal is set, the state machine enters this state until the current AHB transfer is completed. 0x15 **WAIT_END** — When the Wait for Command End bit is set, the state machine enters this state until the DMA device indicates that the command is complete. 0x1C **WRITE_WAIT** — During DMA Write transfers, the state machine waits in this state until the AHB master completes the write to the AHB memory space. 0x1D **HALT_AFTER_TERM** — If HALTONTERMINATE is set and a terminate signal is set, the state machine enters this state and effectively halts. A channel reset is required to exit this state 0x1E **CHECK_WAIT** — If the Chain bit is a 0, the state machine enters this state and effectively halts. 0x1F **WAIT_READY** — When the NAND Wait for Ready bit is set, the state machine enters this state until the GPMI device indicates that the external device is ready.

14.5.14 AHB to APBH DMA Channel n Debug Information (APBH_CH*n*_DEBUG2)

This register gives debug visibility for the APB and AHB byte counts for DMA Channel n.

This register allows debug visibility of the APBH DMA Channel n.

Address: 11_0000h base + 160h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

APBH_CH*n*_DEBUG2 field descriptions

Field	Description
31–16 APB_BYTES	This value reflects the current number of APB bytes remaining to be transfered in the current transfer.
AHB_BYTES	This value reflects the current number of AHB bytes remaining to be transfered in the current transfer.

14.5.15 APBH Bridge Version Register (APBH_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

EXAMPLE

```
if (APBH_VERSION.B.MAJOR != 3)
   Error();
```

Address: 11_0000h base + 800h offset = 11_0800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

APBH_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

Chapter 15
Asynchronous Sample Rate Converter (ASRC)

15.1 Overview

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

The following figure is a system view of the connection between the ASRC block and other blocks.

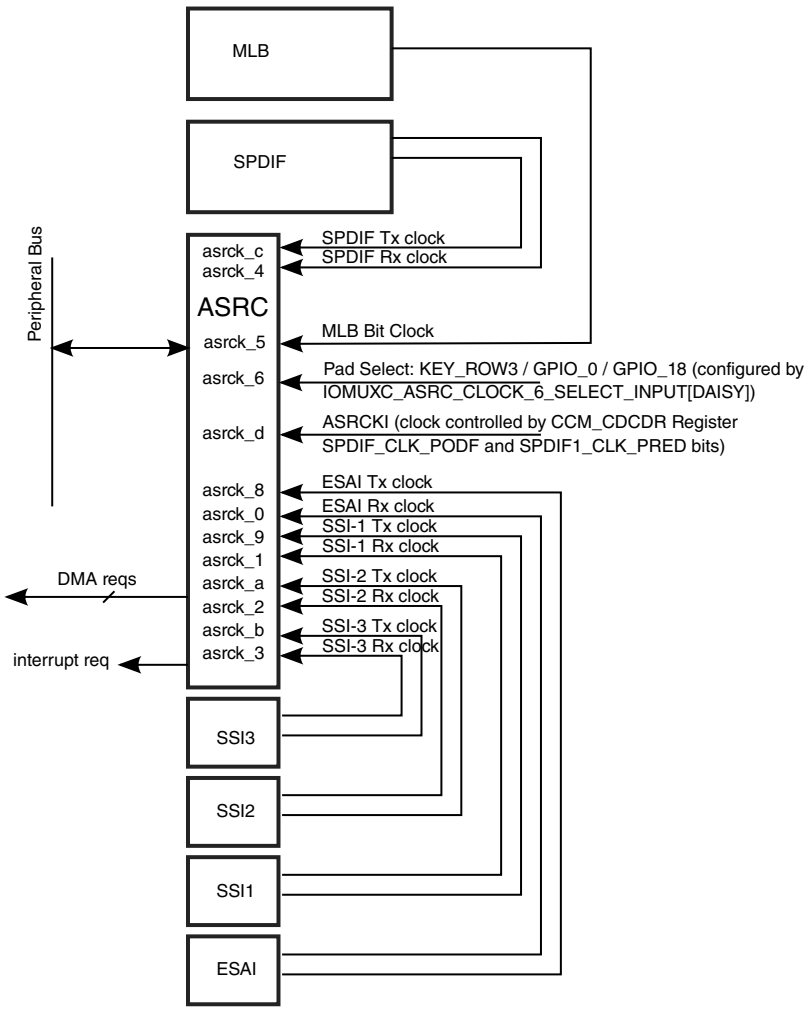

Figure 15-1. General System Overview

The following figure is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

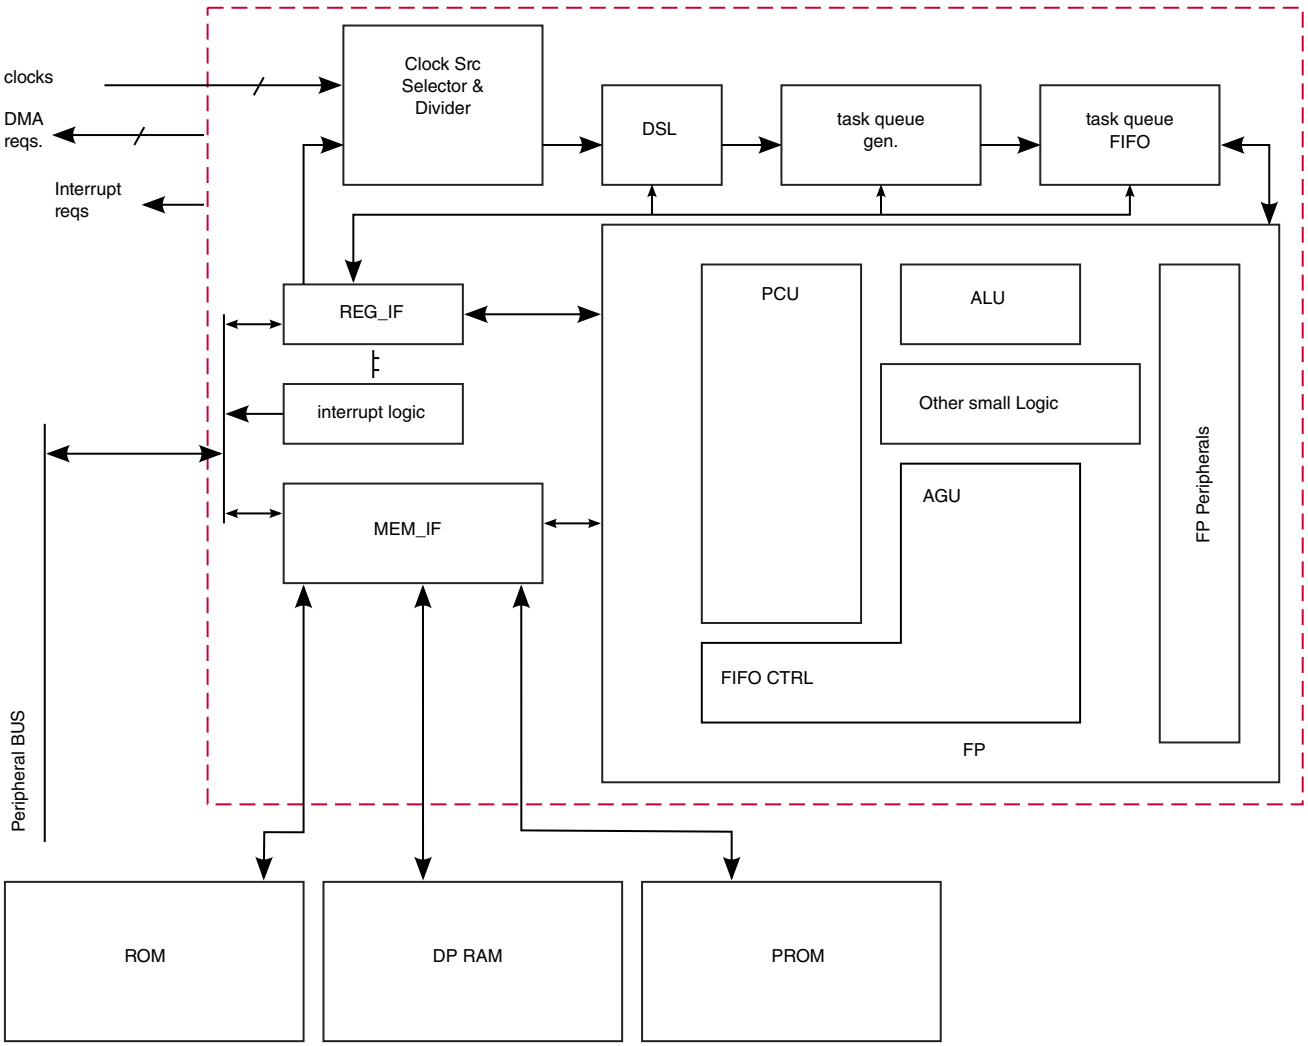

Figure 15-2. ASRC block diagram

15.1.1 Features

Table 15-1. ASRC Specifications

Parameters	Test Conditions	Minimum	Typical	Maximum	Unit
Channels Supported		0 [1]	n (0-10)	10	
Pairs of Rate Conversion		1	-	3	
THD+N	120 MHz < Fs_{ASRC}[2] <160 MHz		-120		dB
Dynamic Range				144	dB
Settling Time			40		ms
Comment:					

1. When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.
2. Fs_{ASRC} is the processing clock of ASRC block.

Other Features:

- Any number (0-10) of contiguous channels can be associated to one of the sampling rate pairs.
- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24-bit width of input data, and 16/24-bit width of output data.
- Designed for rate conversion between 44.1 kHz, 32 kHz, 48 kHz, 96 kHz, and 192 kHz. The useful signal bandwidth is below 24 kHz.
- Other input sampling rates in the range of 8 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter

Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware when both input/output sampling clocks are physically available.
- When both the input sampling clock and the output sampling clock are physically available, the rate conversion can work by configuring the physical clocks.
- When the input sampling clock is not physically available, the rate conversion can still work by setting ideal-ratio values into ASRC interface registers.
- The clock signals come from the following blocks:
  - ESAI, receiving bit clock and transmitting bit clock
  - SPDIF, receiving bit clock and transmitting bit clock
  - other audio peripherals etc.
  - MLB bit clock
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

15.1.2 Modes of Operation

See ASRC Memory Map/Register Definition for a definition of the registers and parameters used in ASRC.

15.1.2.1 Data Transfer Schemes

15.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: channel_0, channel_1, channel_2,..., channel_n, channel_0, channel_1, channel_2, etc. Here channel_n stands for the data intended for the n-th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by ASRCCR_ACIx, x=A,B or C.

Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (ASRIER_ADIEx, where x=A, B or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (ASRSTR_AIDEx, where x=A, B, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (ASRIER_ADIEx, where x=A, B, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (ASRIER_ADIEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

15.1.2.1.2 Data Output Modes

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:
- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

Mode 1 (Polling Mode)

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER_ADOEx, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR_AODFx, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

Mode 2 (Interrupt Mode)

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER_ADOEx, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

Mode 3 (DMA Mode)

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER_ADOEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

15.1.2.2 Word Alignment Supported

15.1.2.2.1 Input Data Alignment Modes

The position and length of input data word to the input data FIFOs ASRDIA, ASRDIB, ASRDIC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

Table 15-2. Input Data Alignment

Format	Bit Number																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15.2 Clocks

The table found here describes the clock sources for ASRC.

Please see clock control block for clock setting, configuration and gating information.

Table 15-4. ASRC Clocks

Clock name	Clock Root	Description
asrck_clock_d	spdif1_clk_root	ASRC module clock (SPDIF clock)
ipg_clk	ahb_clk_root	Peripheral clock
mem_clk	ahb_clk_root	Peripheral access clock

15.3 Interrupts

ASRC has several interrupts events.

The priorities are shown in the following table.

Table 15-5. Interrupt Priorities/Vector

Priority	Offset	Description
lowest	0x0	ASRC Pair A input data needed
	0x2	ASRC Pair B input data needed

Table continues on the next page...

Table 15-5. Interrupt Priorities/Vector (continued)

Priority	Offset	Description
	0x4	ASRC Pair C input data needed
	0x6	ASRC Pair A output data ready
	0x8	ASRC Pair B output data ready
	0xA	ASRC Pair C output data ready
highest	0xC	ASRC Overload

15.4 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register. For some ARM platforms, the six status bits are directly connected to SDMA or HDMA as DMA event signals.

Table 15-6. DMA requests

Type	Description
0	ASRC Pair A input data needed
1	ASRC Pair B input data needed
2	ASRC Pair C input data needed
3	ASRC Pair A output data ready
4	ASRC Pair B output data ready
5	ASRC Pair C output data ready

15.5 Functional Description

This section provides a complete functional description of the block.

15.5.1 Algorithm Description

15.5.1.1 Signal processing flow

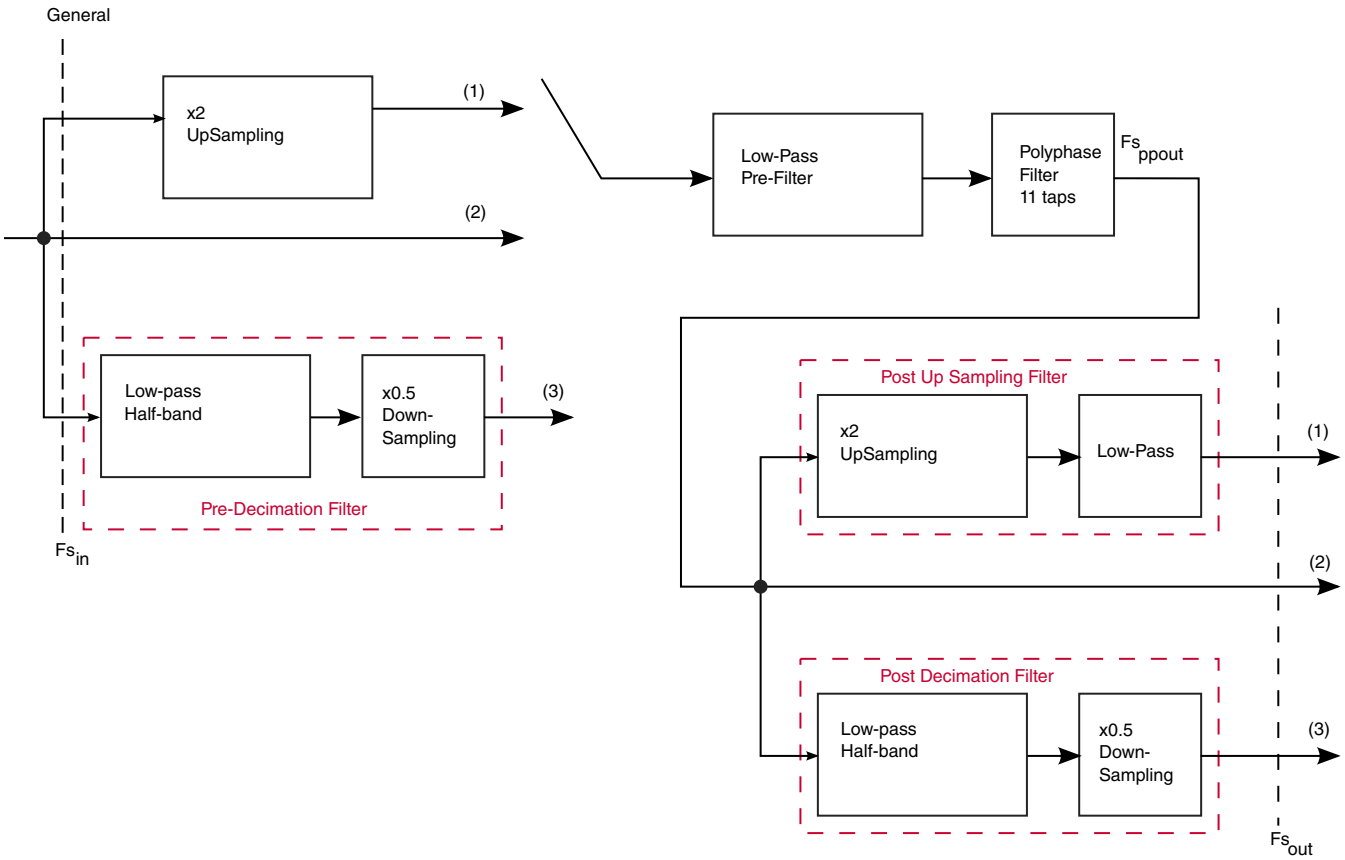

Figure 15-3. Signal processing configurations

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most 0.25 x Fs, where Fs is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (b): Input Branch 1+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (c): Input Branch 1+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (d): Input Branch 2+Output Branch 1:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (e): Input Branch 2+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (f): Input Branch 2+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (g): Input Branch 3+Output Branch 1:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (h): Input Branch 3+Output Branch 2:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (i): Input Branch 3+Output Branch 3:

  The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
  The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

Table 15-7. Pre-processing, post-processing options

{Pre_Proc, Post_Proc}		Fsout (KHz)											
		8	12	16	24	32	44.1	48	64	88.2	96	128	192
Fsin (KHz)	8	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}

	32	{1,2}	{1,2}	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}
	44.1	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}
	48	{2,2}	{1,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	64	{2,2}	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	88.2	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	96	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	128	NA	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	192	NA	NA	NA	{2,2}	{2,2}	{2,2}	{2,2}	{2,1}	{2,1}	{2,1}	{2,1}	{2,1}

NOTE: In the {Pre_Proc, Post_Proc} pair, the meaning of the values are:

Pre_Proc:

- 0 --- Pre-processing Branch 1 as shown in Figure 15-3
- 1 --- Pre-processing Branch 2 as shown in Figure 15-3
- 2 --- Pre-processing Branch 3 as shown in Figure 15-3, decimation-by-2

Post_Proc:

- 0 --- Post-processing Branch 1 as shown in Figure 15-3
- 1 --- Post-processing Branch 2 as shown in Figure 15-3
- 2 --- Post-processing Branch 3 as shown in Figure 15-3

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant_A / input-sample-rate + constant_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant_A / input-sample-rate + constant_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant_D / input-sample-rate + constant_B / output-sample-rate

The constants above (e.g., constant_A means the Constant for Preproc = 0, constant_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

- max latency = min latency + 32 / input-sample-rate + 32 / output-sample-rate

15.5.1.2 Operation of the Filter

15.5.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by:

- Sony/Phillips digital interface (SPDIF)
- Enhanced Serial Audio Interface (ESAI),
- Media Local Bus controller (MLB)
- Core master clock derivative as ASRCK1

Figure 15-4. Clock Source Selector and Divider

Software can set the ASRC Clock Source Register (ASRCSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

15.6 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"

#include "stdio.h"

#include "soc_api.h"

int incnt=0;

int outcnt=0;

#include "wy_ideal_ratio_dataini_part.h"

WORD   IdealRatio_High=0x04; //

WORD   IdealRatio_Low=0x0; //
```

```
void asrc_config_alloc(WORD ASRCTR_VAL, WORD ASRIER_VAL, WORD ASRCNCR_VAL,
                           WORD ASRCFG_VAL, WORD ASRCDR1_VAL, WORD ASRCDR2_VAL,
                           WORD ASRCSR_VAL)

{  // Disable ASRC

    reg32_write(ASRC_ASRCTR,0x0);

15.7 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

ASRC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
203_4000	ASRC Control Register (ASRC_ASRCTR)	32	R/W	0000_0000h	15.7.1/630

15.7.1 ASRC Control Register (ASRC_ASRCTR)

The ASRC control register (ASRCTR) is a read/write register that controls the ASRC operations.

Address: 203_4000h base + 0h offset = 203_4000h

ASRC_ASRCTR field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 -	This field is reserved. Reserved. Should be written as zero for compatibility.
22 ATSC	ASRC Pair C Automatic Selection For Processing Options When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG: PREMODC, ASRCFG:POSTMODC see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair C. This bit should be disabled when {USRC, IDRC}={1,1}.
21 ATSB	ASRC Pair B Automatic Selection For Processing Options When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG: PREMODB, ASRCFG:POSTMODB see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair B. This bit should be disabled when {USRB, IDRB}={1,1}.
20 ATSA	ASRC Pair A Automatic Selection For Processing Options When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG: PREMODA, ASRCFG:POSTMODA see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair A. This bit should be disabled when {USRA, IDRA}={1,1}.
19 -	This field is reserved. Reserved. Should be written as zero for compatibility.
18 USRC	Use Ratio for Pair C Use ratio as the input to ASRC. This bit is used in conjunction with IDRC control bit.
17 IDRC	Use Ideal Ratio for Pair C When USRC=0, this bit has no usage. When USRC=1 and IDRC=0, ASRC internal measured ratio will be used. When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to Table 15-7 in this case.
16 USRB	Use Ratio for Pair B Use ratio as the input to ASRC. This bit is used in conjunction with IDRB control bit.
15 IDRB	Use Ideal Ratio for Pair B When USRB=0, this bit has no usage. When USRB=1 and IDRB=0, ASRC internal measured ratio will be used. When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used.It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to Table 15-7 in this case.

Table continues on the next page...

ASRC_ASRCTR field descriptions (continued)

Field	Description
14 USRA	Use Ratio for Pair A Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit.
13 IDRA	Use Ideal Ratio for Pair A When USRA=0, this bit has no usage. When USRA=1 and IDRA=0, ASRC internal measured ratio will be used. When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to Table 15-7 in this case.
12–5 -	This field is reserved. Reserved. Should be written as zero for compatibility.
4 SRST	Software Reset This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically.
3 ASREC	ASRC Enable C Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled.
2 ASREB	ASRC Enable B Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled.
1 ASREA	ASRC Enable A Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled.
0 ASRCEN	ASRC Enable Enable the operation of ASRC.

15.7.2 ASRC Interrupt Enable Register (ASRC_ASRIER)

Address: 203_4000h base + 4h offset = 203_4004h

7 AFPWE	FP in Wait State Interrupt Enable Enables the FP in wait state interrupt. 1 interrupt enabled 0 interrupt disabled
6 AOLIE	Overload Interrupt Enable Enables the overload interrupt. 1 interrupt enabled 0 interrupt disabled
5 ADOEC	Data Output C Interrupt Enable Enables the data output C interrupt. 1 interrupt enabled 0 interrupt disabled
4 ADOEB	Data Output B Interrupt Enable Enables the data output B interrupt. 1 interrupt enabled 0 interrupt disabled

Table continues on the next page...

ASRC_ASRIER field descriptions (continued)

Field	Description
3 ADOEA	Data Output A Interrupt Enable Enables the data output A interrupt. 1 interrupt enabled 0 interrupt disabled
2 ADIEC	Data Input C Interrupt Enable Enables the data input C interrupt. 1 interrupt enabled 0 interrupt disabled
1 ADIEB	Data Input B Interrupt Enable Enables the data input B interrupt. 1 interrupt enabled 0 interrupt disabled
0 ADIEA	Data Input A Interrupt Enable Enables the data input A Interrupt. 1 interrupt enabled 0 interrupt disabled

15.7.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)

The ASRC channel number configuration register (ASRCNCR) is a read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203_4000h base + Ch offset = 203_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved								Reserved												ANCC				ANCB				ANCA

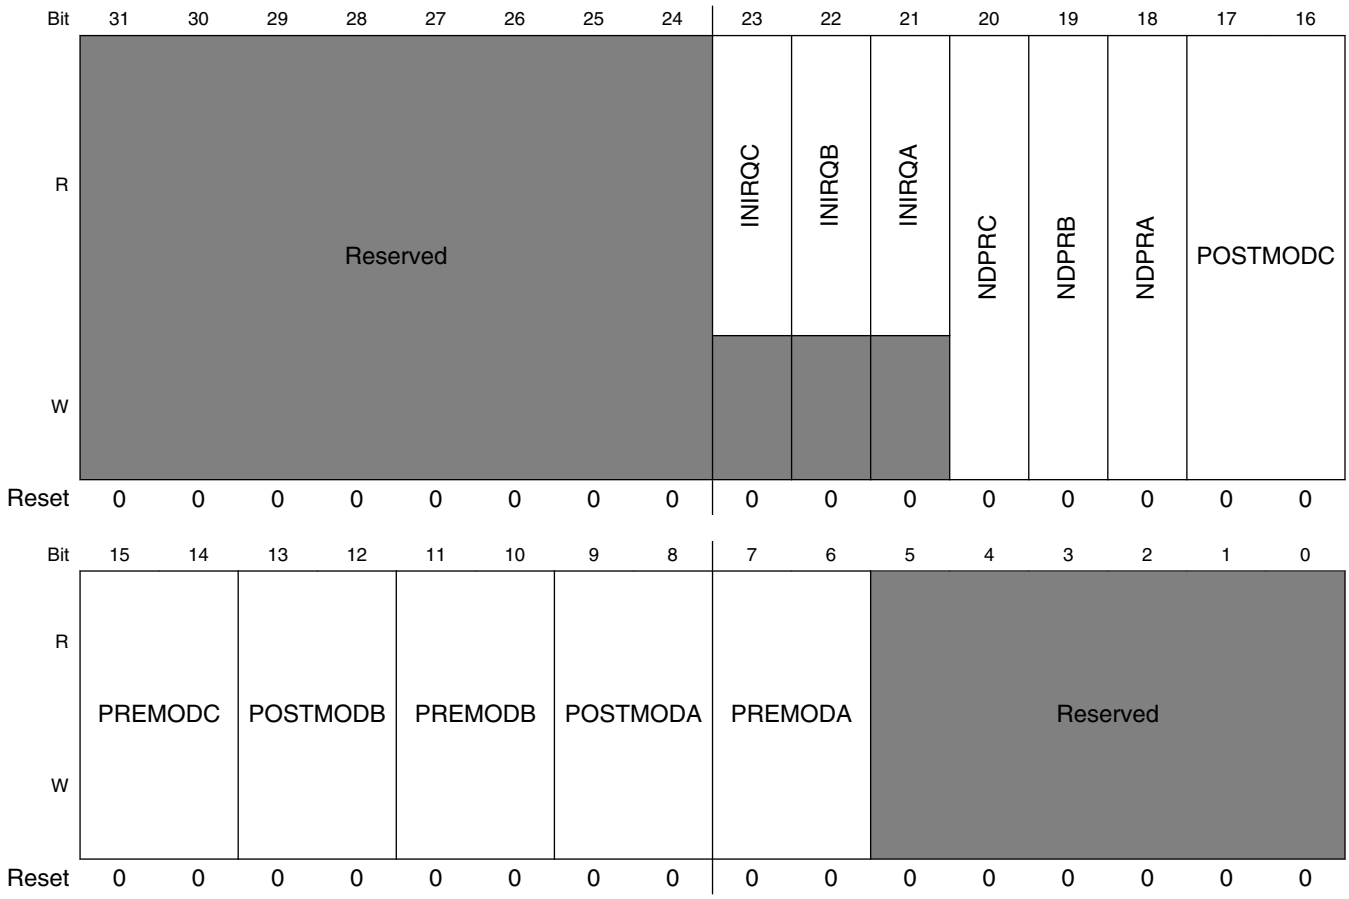
ASRC_ASRCNCR field descriptions



Field	Description
31–24 -	This field is reserved. Reserved
23–12 -	This field is reserved. Reserved. Should be written as zero for compatibility.
11–8 ANCC	Number of C Channels[1] 0000 0 channels in C (Pair C is disabled) 0001 1 channel in C 0010 2 channels in C 0011 3 channels in C 0100 4 channels in C 0101 5 channels in C 0110 6 channels in C 0111 7 channels in C 1000 8 channels in C 1001 9 channels in C 1010 10 channels in C 1011-1111 Should not be used.
7–4 ANCB	Number of B Channels 0000 0 channels in B (Pair B is disabled) 0001 1 channel in B 0010 2 channels in B 0011 3 channels in B 0100 4 channels in B 0101 5 channels in B 0110 6 channels in B 0111 7 channels in B 1000 8 channels in B 1001 9 channels in B 1010 10 channels in B 1011-1111 Should not be used.
ANCA	Number of A Channels 0000 0 channels in A (Pair A is disabled) 0001 1 channel in A 0010 2 channels in A 0011 3 channels in A 0100 4 channels in A 0101 5 channels in A 0110 6 channels in A 0111 7 channels in A 1000 8 channels in A 1001 9 channels in A 1010 10 channels in A 1011-1111 Should not be used.

1. ANCC+ANCB+ANCA<=10. Hardware is not checking the constraint. Programmer should take the responsibility to ensure the constraint is satisfied.

15.7.4 ASRC Filter Configuration Status Register (ASRC_ASRCFG)

The ASRC configuration status register (ASRCFG) is a read/write register that sets and/or automatically senses the ASRC operations.

Address: 203_4000h base + 10h offset = 203_4010h

ASRC_ASRCFG field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 INIRQC	Initialization for Conversion Pair C is served When this bit is 1, it means the initialization for conversion pair C is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREC=0 or ASRCTR:ASRCEN=0).
22 INIRQB	Initialization for Conversion Pair B is served When this bit is 1, it means the initialization for conversion pair B is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREB=0 or ASRCTR:ASRCEN=0).

Table continues on the next page...

ASRC_ASRCFG field descriptions (continued)

Field	Description
21 INIRQA	Initialization for Conversion Pair A is served When this bit is 1, it means the initialization for conversion pair A is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREA=0 or ASRCTR:ASRCEN=0).
20 NDPRC	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair C 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
19 NDPRB	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair B 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameter. Use the parameters already stored in RAM.
18 NDPRA	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair A 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
17–16 POSTMODC	Post-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal Processing Flow. 01 Select Direct-Connection as defined in Signal Processing Flow. 10 Select Downsampling-by-2 as defined in Signal Processing Flow.
15–14 PREMODC	Pre-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODC[1-0] have no use.
13–12 POSTMODB	Post-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow
11–10 PREMODB	Pre-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow

Table continues on the next page...

ASRC_ASRCFG field descriptions (continued)

Field	Description
	10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODB[1-0] have no use.
9–8 POSTMODA	Post-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCTR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSA=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow
7–6 PREMODA	Pre-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCTR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSA=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODA[1-0] have no use.
-	This field is reserved. Reserved. Should be written as zero for compatibility.

15.7.5 ASRC Clock Source Register (ASRC_ASRCSR)

The ASRC clock source register (ASRCSR) is a read/write register that controls the sources of the input and output clocks of the ASRC.

Address: 203_4000h base + 14h offset = 203_4014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASRC_ASRCDR2 field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–12 -	This field is reserved. Reserved. Should be written as zero for compatibility.
11–9 AOCDC	Output Clock Divider C Specify the divide ratio of the output clock divider C. The divide ratio may range from 1 to 8 (AOCDC[2:0] = 000 to 111).
8–6 AOCPC	Output Clock Prescaler C Specify the prescaling factor of the output prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.
5–3 AICDC	Input Clock Divider C Specify the divide ratio of the input clock divider C. The divide ratio may range from 1 to 8 (AICDC[2:0] = 000 to 111).
AICPC	Input Clock Prescaler C Specify the prescaling factor of the input prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.

15.7.8 ASRC Status Register (ASRC_ASRSTR)

The ASRC status register (ASRSTR) is a read/write register used by the processor core to examine the status of the ASRC block and clear the overload interrupt request and AOLE flag bit. Read the status register will return the current state of ASRC.

Address: 203_4000h base + 20h offset = 203_4020h

ASRC_ASRSTR field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–22 -	This field is reserved. Reserved. Should be written as zero for compatibility.

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
21 DSLCNT	DSL Counter Input to FIFO ready When set, this bit indicates that new DSL counter information is stored in the internal ASRC FIFO. When clear, this bit indicates that new DSL counter information is in the process of storage into the internal ASRC FIFO. When ASRIER:AFPWE=1, the rising edge of this signal will propose an interrupt request. Writing any value with this bit set will clear the interrupt request proposed by the rising edge of this bit.
20 ATQOL	Task Queue FIFO overload When set, this bit indicates that task queue FIFO logic is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
19 AOOLC	Pair C Output Task Overload When set, this bit indicates that pair C output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
18 AOOLB	Pair B Output Task Overload When set, this bit indicates that pair B output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
17 AOOLA	Pair A Output Task Overload When set, this bit indicates that pair A output task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
16 AIOLC	Pair C Input Task Overload When set, this bit indicates that pair C input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
15 AIOLB	Pair B Input Task Overload When set, this bit indicates that pair B input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
14 AIOLA	Pair A Input Task Overload When set, this bit indicates that pair A input task is oveloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
13 AODOC	Output Data Buffer C has overflowed When set, this bit indicates that output data buffer C has overflowed. When clear, this bit indicates that output data buffer C has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
12 AODOB	Output Data Buffer B has overflowed When set, this bit indicates that output data buffer B has overflowed. When clear, this bit indicates that output data buffer B has not overflowed

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

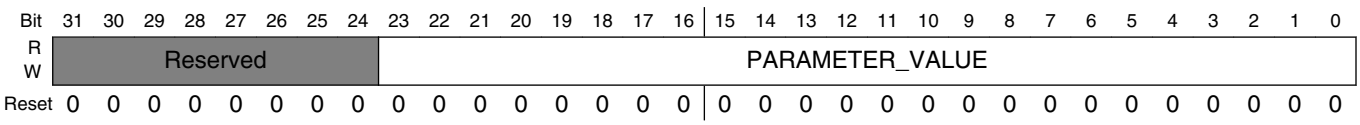
Field	Description
	The bit is cleared when writing ASRSTR:AOLE as 1.
11 AODOA	Output Data Buffer A has overflowed When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
10 AIDUC	Input Data Buffer C has underflowed When set, this bit indicates that input data buffer C has underflowed. When clear, this bit indicates that input data buffer C has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
9 AIDUB	Input Data Buffer B has underflowed When set, this bit indicates that input data buffer B has underflowed. When clear, this bit indicates that input data buffer B has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
8 AIDUA	Input Data Buffer A has underflowed When set, this bit indicates that input data buffer A has underflowed. When clear, this bit indicates that input data buffer A has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
7 FPWT	FP is in wait states This bit is for debug only. When set, this bit indicates that ASRC is in wait states. When clear, this bit indicates that ASRC is not in wait states.
6 AOLE	Overload Error Flag When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be: - too high input clock frequency, - too high output clock frequency, - incorrect selection of the pre-filter, - low ASRC processing clock, - too many channels, - underrun, - or any combination of the reasons above. Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer. If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set. Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit.
5 AODFC	Number of data in Output Data Buffer C is greater than threshold

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
	When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
4 AODFB	Number of data in Output Data Buffer B is greater than threshold When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
3 AODFA	Number of data in Output Data Buffer A is greater than threshold When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
2 AIDEC	Number of data in Input Data Buffer C is less than threshold When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
1 AIDEB	Number of data in Input Data Buffer B is less than threshold When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
0 AIDEA	Number of data in Input Data Buffer A is less than threshold When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.

15.7.9 ASRC Parameter Register n (ASRC_ASRPMn*n*)



Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled. Recommended values are given in ASRC Misc Control Register 1 for Pair C below,

Table 15-8. ASRC Parameter Registers (ASRPM1~ASRPM5)

Register	Offset	Access	Reset Value	Recommend Value
asrcpm1	0x40	R/W	0x00_0000	0x7fffff
asrcpm2	0x44	R/W	0x00_0000	0x255555
asrcpm3	0x48	R/W	0x00_0000	0xff7280
asrcpm4	0x4C	R/W	0x00_0000	0xff7280
asrcpm5	0x50	R/W	0x00_0000	0xff7280

IDRATIOC_L	IDRATIOC[23:0]. Low part of ideal ratio value for pair C.

15.7.20 ASRC 76 kHz Period in terms of ASRC processing clock (ASRC_ASR76K)

The register (ASR76K) holds the period of the 76 kHz sampling clock in terms of the ASRC processing clock with frequency Fs_{ASRC}. ASR76K = Fs_{ASRC}/Fs_{76k}. Reset value is 0x0A47 which assumes that Fs_{ASRC}=200 MHz. This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). In a system when Fs_{ASRC} = 133 MHz, the value should be assigned explicitly as 0x06D6 in user application code.

Address: 203_4000h base + 98h offset = 203_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15.7.22 ASRC Misc Control Register for Pair A (ASRC_ASRMCRA)

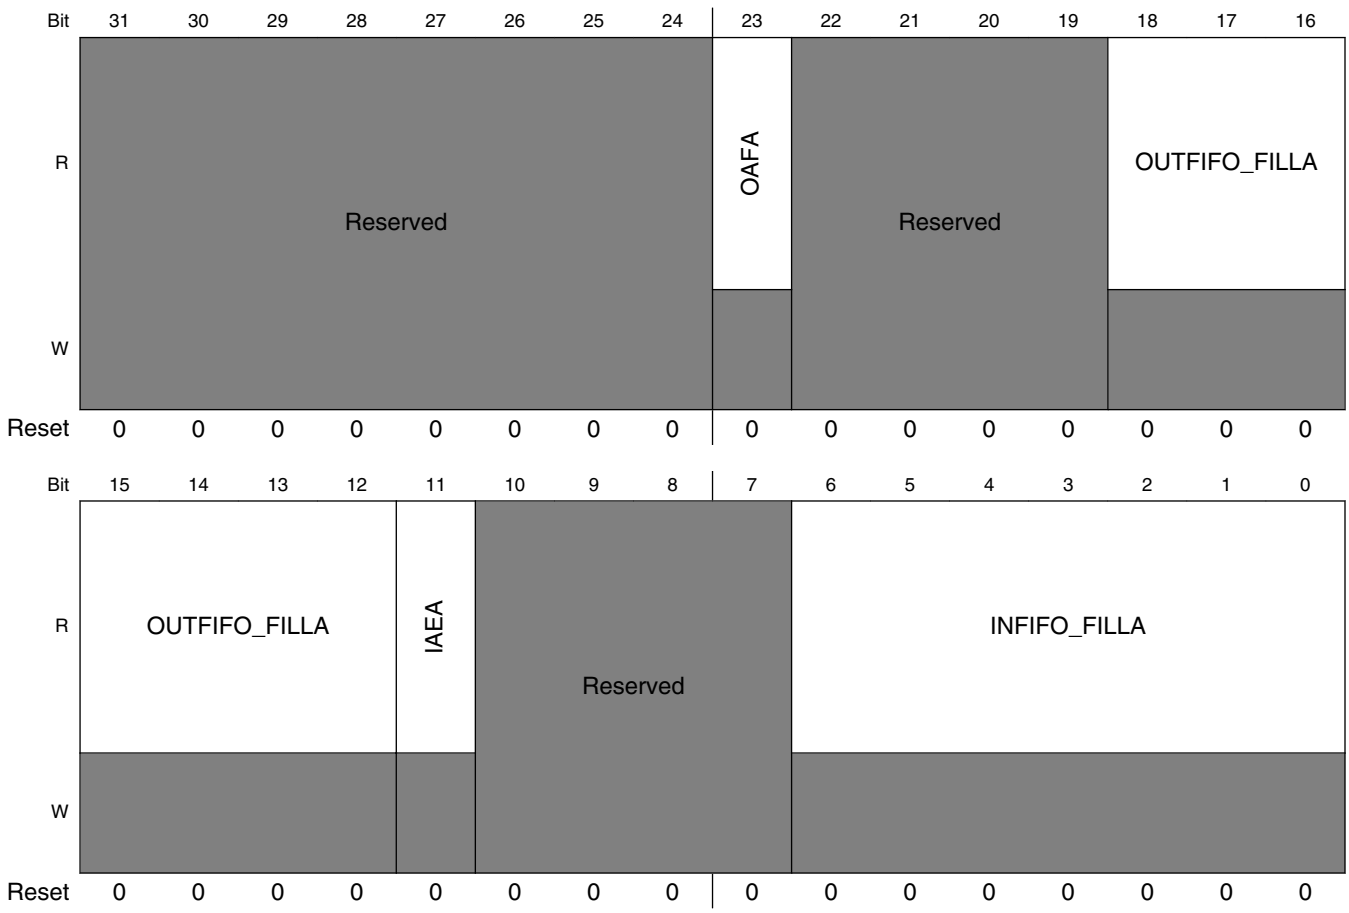
The register (ASRMCRA) is used to control Pair A internal logic.

Address: 203_4000h base + A0h offset = 203_40A0h

ASRC_ASRMCRA field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 ZEROBUFA	Initialize buf of Pair A when pair A is enabled. Always clear option. This bit is used to control whether the buffer is to be zeroized when pair A is enabled. 1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSHA	Use external thresholds for FIFO control of Pair A This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair A. 1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLA	Stall Pair A conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair A. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel.

Table continues on the next page...



ASRC_ASRMCRA field descriptions (continued)

Field	Description
	1 Stall Pair A conversion in case of near empty/full FIFO conditions. 0 Don't stall Pair A conversion even in case of near empty/full FIFO conditions.
20 BYPASSPOLYA	Bypass Polyphase Filtering for Pair A This bit will determine whether the polyphase filtering part of Pair A conversion will be bypassed. 1 Bypass polyphase filtering. 0 Don't bypass polyphase filtering.
19–18 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
17–12 OUTFIFO_ THRESHOLDA	The threshold for Pair A's output FIFO per channel These bits stand for the threshold for Pair A's output FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of output FIFO fillings of the pair is greater than n samples per channel, the output data ready flag is set; when the number of output FIFO fillings of the pair is less than or equal to n samples per channel, the output data ready flag is automatically cleared.
11 RSYNIFA	Re-sync Input FIFO Channel Counter If bit set, force ASRCCR:ACIA=0. If bit clear, untouch ASRCCR:ACIA.
10 RSYNOFA	Re-sync Output FIFO Channel Counter If bit set, force ASRCCR:ACOA=0. If bit clear, untouch ASRCCR:ACOA.
9–6 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_ THRESHOLDA	The threshold for Pair A's input FIFO per channel These bits stand for the threshold for Pair A's input FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of input FIFO fillings of the pair is less than n samples per channel, the input data needed flag is set; when the number of input FIFO fillings of the pair is greater than or equal to n samples per channel, the input data needed flag is automatically cleared.

15.7.23 ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA)

The register (ASRFSTA) is used to show Pair A internal FIFO conditions.

Address: 203_4000h base + A4h offset = 203_40A4h

ASRC_ASRFSTA field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 OAFA	Output FIFO is near Full for Pair A This bit is to indicate whether the output FIFO of Pair A is near full.
22–19 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
18–12 OUTFIFO_FILLA	The fillings for Pair A's output FIFO per channel These bits stand for the fillings for Pair A's output FIFO per channel. Possible range is [0,64].

Table continues on the next page...

ASRC_ASRFSTA field descriptions (continued)

Field	Description
11 IAEA	Input FIFO is near Empty for Pair A This bit is to indicate whether the input FIFO of Pair A is near empty.
10–7 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_FILLA	The fillings for Pair A's input FIFO per channel These bits stand for the fillings for Pair A's input FIFO per channel. Possible range is [0,64].

15.7.24 ASRC Misc Control Register for Pair B (ASRC_ASRMCRB)

The register (ASRMCRB) is used to control Pair B internal logic.

Address: 203_4000h base + A8h offset = 203_40A8h

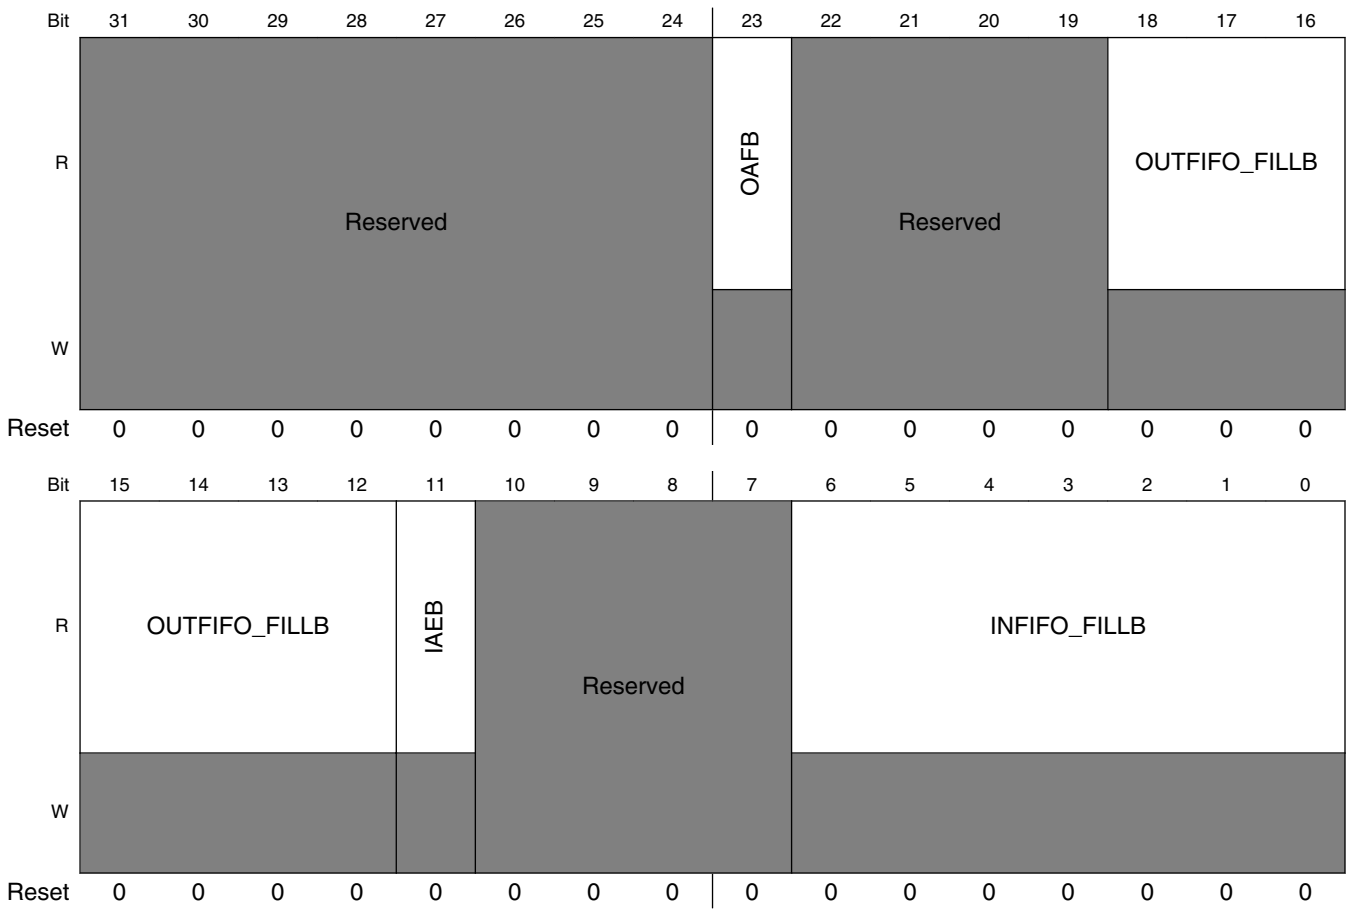
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved								ZEROBUFB	EXTTHRSHB	BUFSTALLB	BYPASSPOLYB	Reserved		OUTFIFO_THRESHOLDB	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	OUTFIFO_THRESHOLDB				RSYNIFB	RSYNOFB	Reserved				INFIFO_THRESHOLDB					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ASRC_ASRMCRB field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 ZEROBUFB	Initialize buf of Pair B when pair B is enabled This bit is used to control whether the buffer is to be zeroized when pair B is enabled. 1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSHB	Use external thresholds for FIFO control of Pair B

Table continues on the next page...



ASRC_ASRMCRB field descriptions (continued)

Field	Description
	This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair B. 1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLB	Stall Pair B conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair B. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel. 1 Stall Pair B conversion in case of near empty/full FIFO conditions. 0 Don't stall Pair B conversion even in case of near empty/full FIFO conditions.
20 BYPASSPOLYB	Bypass Polyphase Filtering for Pair B This bit will determine whether the polyphase filtering part of Pair B conversion will be bypassed. 1 Bypass polyphase filtering. 0 Don't bypass polyphase filtering.
19–18 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
17–12 OUTFIFO_ THRESHOLDB	The threshold for Pair B's output FIFO per channel These bits stand for the threshold for Pair B's output FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of output FIFO fillings of the pair is greater than n samples per channel, the output data ready flag is set; when the number of output FIFO fillings of the pair is less than or equal to n samples per channel, the output data ready flag is automatically cleared.
11 RSYNIFB	Re-sync Input FIFO Channel Counter If bit set, force ASRCCR:ACIB=0. If bit clear, untouch ASRCCR:ACIB.
10 RSYNOFB	Re-sync Output FIFO Channel Counter If bit set, force ASRCCR:ACOB=0. If bit clear, untouch ASRCCR:ACOB.
9–6 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_ THRESHOLDB	The threshold for Pair B's input FIFO per channel These bits stand for the threshold for Pair B's input FIFO per channel. Possible range is [0,63]. When the value is n, it means that: when the number of input FIFO fillings of the pair is less than n samples per channel, the input data needed flag is set; when the number of input FIFO fillings of the pair is greater than or equal to n samples per channel, the input data needed flag is automatically cleared.

15.7.25 ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB)

The register (ASRFSTB) is used to show Pair B internal FIFO conditions.

Address: 203_4000h base + ACh offset = 203_40ACh

ASRC_ASRFSTB field descriptions

0 OW16	Bit Width Option of the output FIFO This bit will determine the bit width option of the output FIFO. 1 16-bit output data 0 24-bit output data.

Chapter 16
Digital Audio Multiplexer (AUDMUX)

16.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in Functional Description.

Figure 16-1 shows the block diagram.

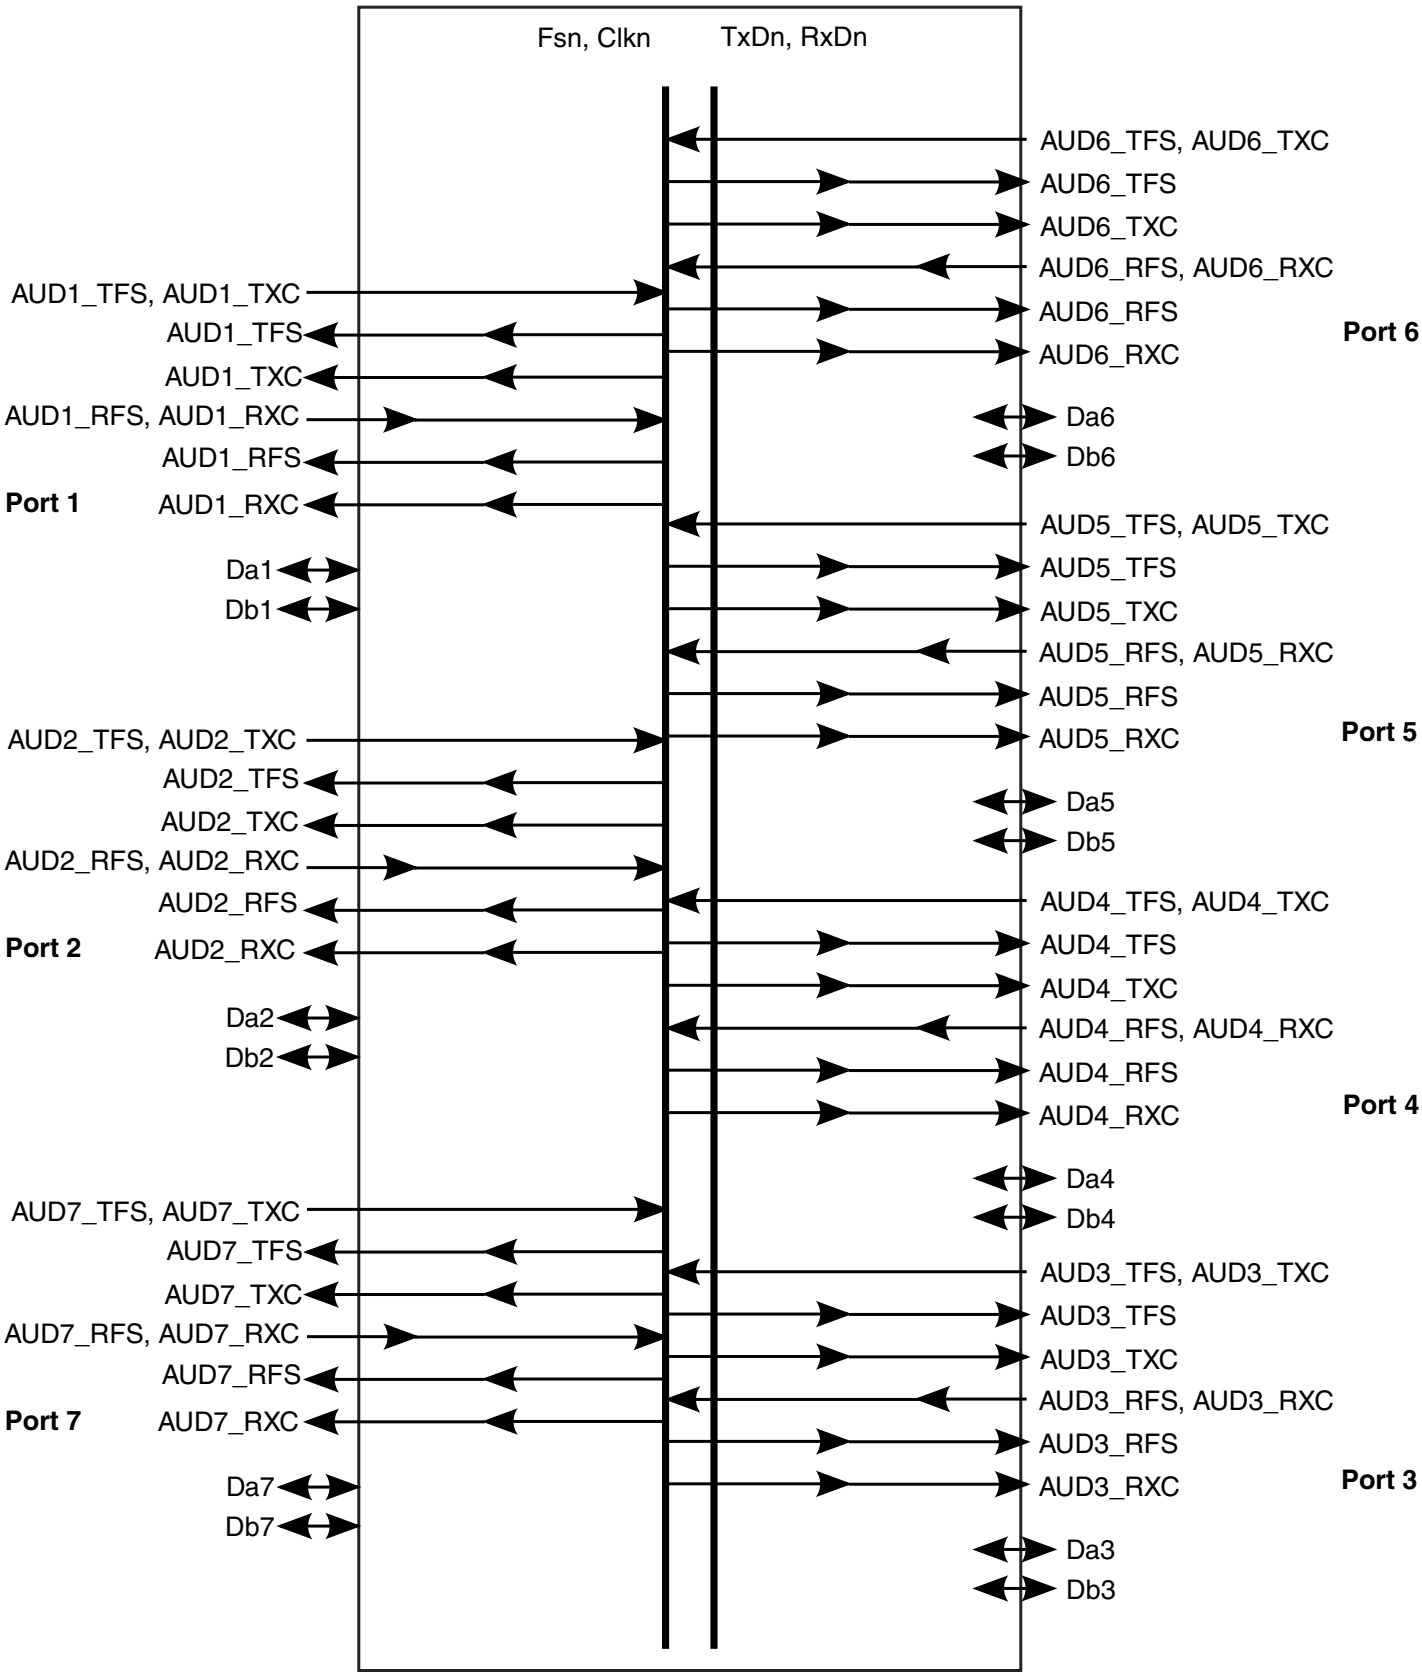

Figure 16-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

16.1.1 Features

Key features of the block include:

- Three internal ports
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

16.1.2 Modes and Operations

The AUDMUX supports the modes described in Operating Modes.

16.2 External Signals

The following table describes the external signals of AUDMUX:

Table 16-1. AUDMUX External Signals

Signal	Description	Pad	Mode	Direction
AUD3_RXC (RXC)	Receive clock signal	CSI0_DAT10	ALT1	IO
AUD3_RXD (RXD)	Data receive signal	CSI0_DAT7	ALT4	IO
AUD3_RXFS (RXFS)	Receive Frame sync signal	CSI0_DAT11	ALT1	IO
AUD3_TXC (TXC)	Transmit clock signal	CSI0_DAT4	ALT4	IO

Table continues on the next page...

Table 16-1. AUDMUX External Signals (continued)

Signal	Description	Pad	Mode	Direction
AUD3_TXD (TXD)	Data transmit signal	CSI0_DAT5	ALT4	IO
AUD3_TXFS (TXFS)	Transmit Frame sync signal	CSI0_DAT6	ALT4	IO
AUD4_RXC (RXC)	Receive clock signal	DISP0_DAT19	ALT4	IO
		SD2_CMD	ALT3	
AUD4_RXD (RXD)	Data receive signal	DISP0_DAT23	ALT3	IO
		SD2_DAT0	ALT3	
AUD4_RXFS (RXFS)	Receive Frame sync signal	DISP0_DAT18	ALT4	IO
		SD2_CLK	ALT3	
AUD4_TXC (TXC)	Transmit clock signal	DISP0_DAT20	ALT3	IO
		SD2_DAT3	ALT3	
AUD4_TXD (TXD)	Data transmit signal	DISP0_DAT21	ALT3	IO
		SD2_DAT2	ALT3	
AUD4_TXFS (TXFS)	Transmit Frame sync signal	DISP0_DAT22	ALT3	IO
		SD2_DAT1	ALT3	
AUD5_RXC (RXC)	Receive clock signal	DISP0_DAT14	ALT3	IO
		EIM_D25	ALT6	
AUD5_RXD (RXD)	Data receive signal	DISP0_DAT19	ALT3	IO
		KEY_ROW1	ALT2	
AUD5_RXFS (RXFS)	Receive Frame sync signal	DISP0_DAT13	ALT3	IO
		EIM_D24	ALT6	
AUD5_TXC (TXC)	Transmit clock signal	DISP0_DAT16	ALT3	IO
		KEY_COL0	ALT2	
AUD5_TXD (TXD)	Data transmit signal	DISP0_DAT17	ALT3	IO
		KEY_ROW0	ALT2	
AUD5_TXFS (TXFS)	Transmit Frame sync signal	DISP0_DAT18	ALT3	IO
		KEY_COL1	ALT2	
AUD6_RXC (RXC)	Receive clock signal	DISP0_DAT6	ALT3	IO
AUD6_RXD (RXD)	Data receive signal	DI0_PIN4	ALT2	IO
AUD6_RXFS (RXFS)	Receive Frame sync signal	DISP0_DAT5	ALT3	IO
AUD6_TXC (TXC)	Transmit clock signal	DI0_PIN15	ALT2	IO
AUD6_TXD (TXD)	Data transmit signal	DI0_PIN2	ALT2	IO
AUD6_TXFS (TXFS)	Transmit Frame sync signal	DI0_PIN3	ALT2	IO

16.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 16-2. AUDMUX Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

16.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg_clk_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

16.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

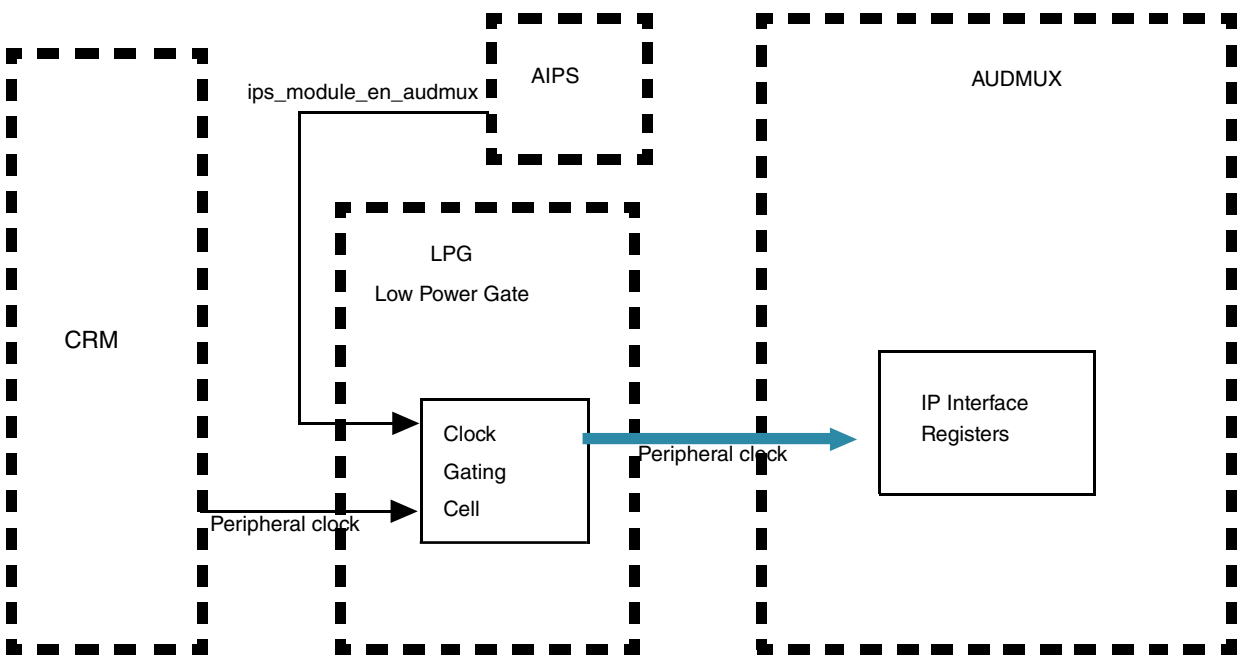

Figure 16-2. AUDMUX Clocking Scheme

16.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

16.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

Default Port Configuration, describes the default configuration of the ports.

16.4.1 Default Port Configuration

After a reset, each port defaults to normal mode (PDCR*n*[MODE] = 0) with synchronous timing mode (PTCR*n*[SYN] = 1) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
  - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
  - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
  - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
  - Clock and frame syncs are inputs.

16.5 Functional Description

This section provides a complete functional description of the AUDMUX.

16.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

Figure 16-1 shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI’s Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

16.5.1.1 Port Receive Data Modes

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

Figure 16-3 shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE:

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.
- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

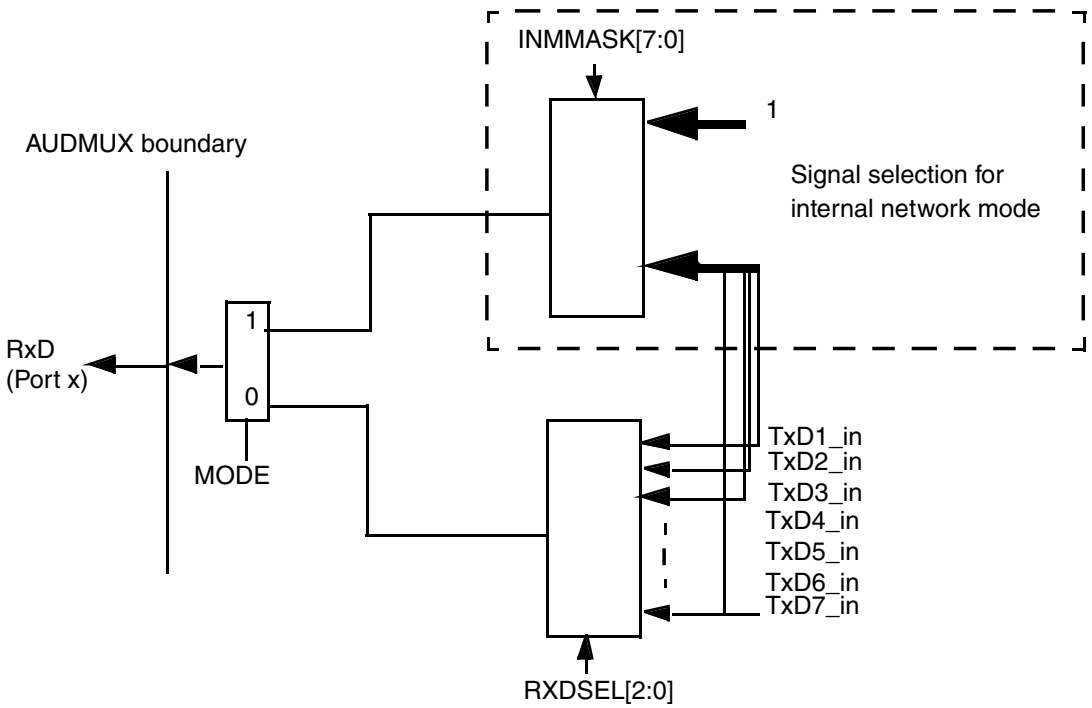

Figure 16-3. Receive Data Logic for Port x

16.5.1.1.1 Normal Mode

In normal mode (MODE = 0) , not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the RXDSEL[2:0] setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others.

If a user wishes to transmit SSI1's data (TXD) to port 5, PDCR5's RXDSEL[2:0] must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1, PTCR5's TFSEL[3:0] and TCSEL[3:0] must be set to 0000b (port1) and 0000b (port1), while setting PTCR5's TFSDIR and TCLKDIR to 1.

If either or both of the clocks are to be received from external device to SSI1, PTCR5's TCLKDIR and/or TFSDIR must be set to 0 (input), and PTCR1's TFSEL[3:0] and/or TCLKDIR[3:0] to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set PDCR2's RXDSEL[2:0] to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device, PTCR2's RFSEL[3:0] and RCSEL[3:0] must be set to 011b while PTCR4's RFSDIR and RCLKDIR set to 0.

16.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1) , the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn_obe selection is ignored and RxD_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

Internal Network Mode Example 1

SSI_m and SSI_n are used with Port 3 in internal network mode as shown in Figure 16-4. No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

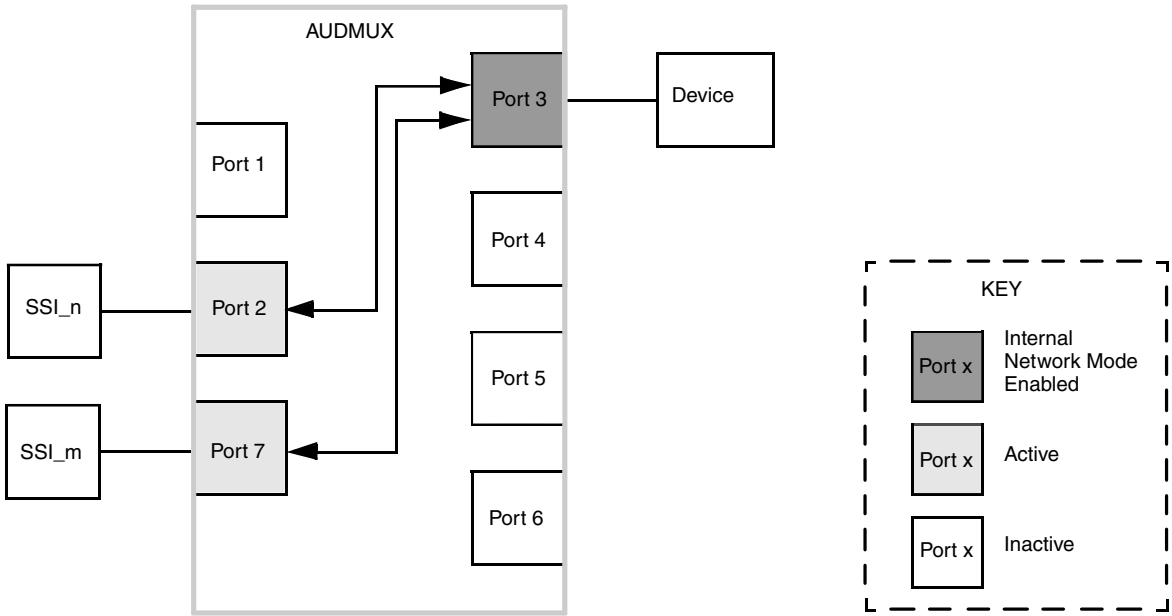

Figure 16-4. Block Diagram For Example 1

See Figure 16-5 for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for SSI_m and SSI_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

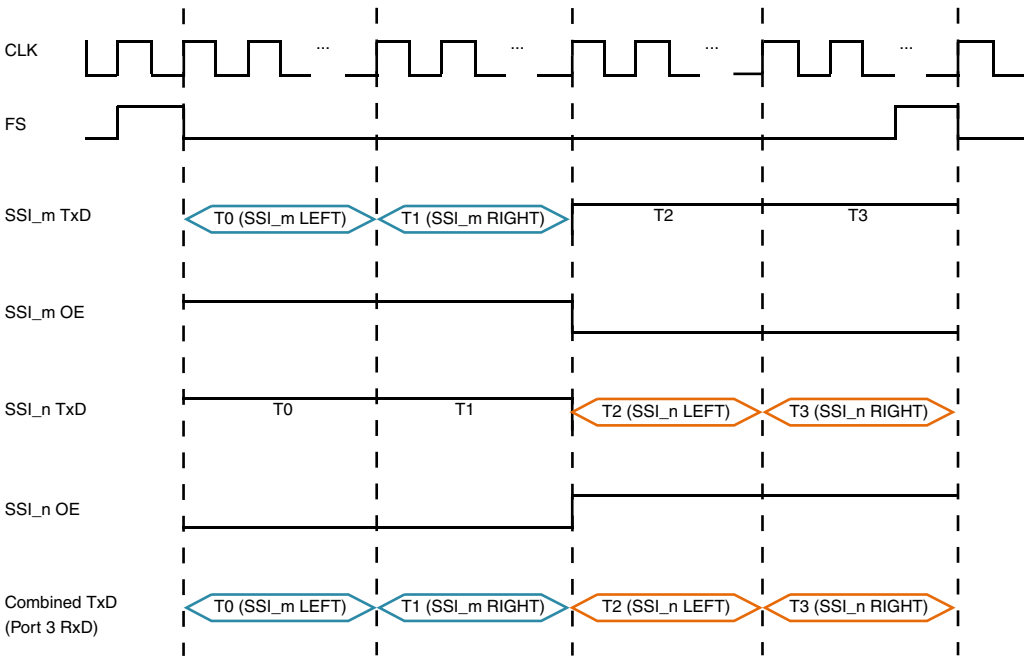

Figure 16-5. Example Using Internal Ports For Transmit Data

Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

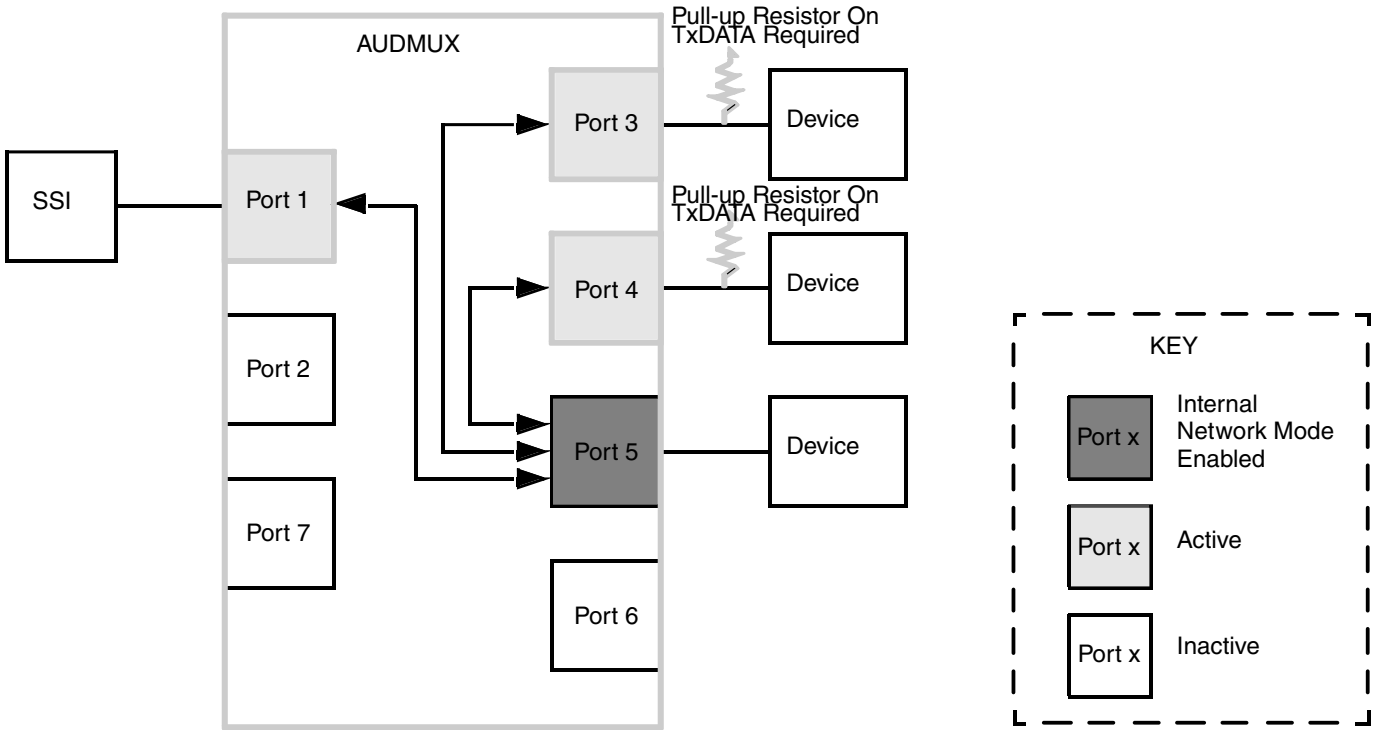

Figure 16-6. Block Diagram For Example 2

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

Rmax = 1 / (2 * f_{bc} * C) where:

- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

Note the highlighted areas in the Figure 16-7. This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

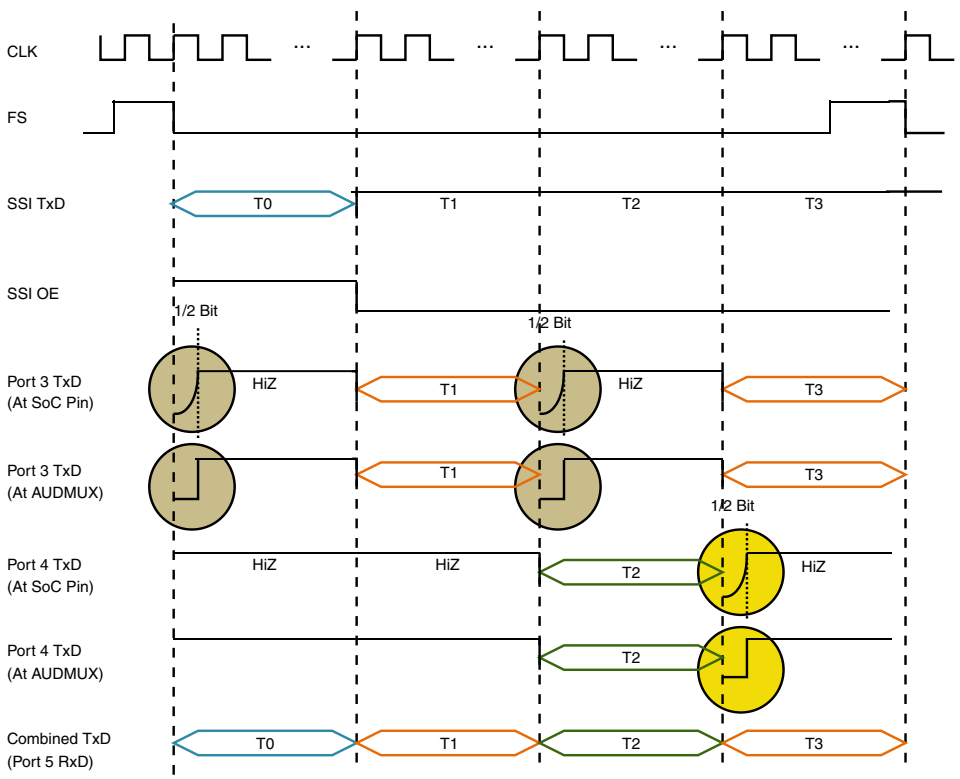

Figure 16-7. Example Using External Ports for Transmit Data in Consecutive Timeslots

Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

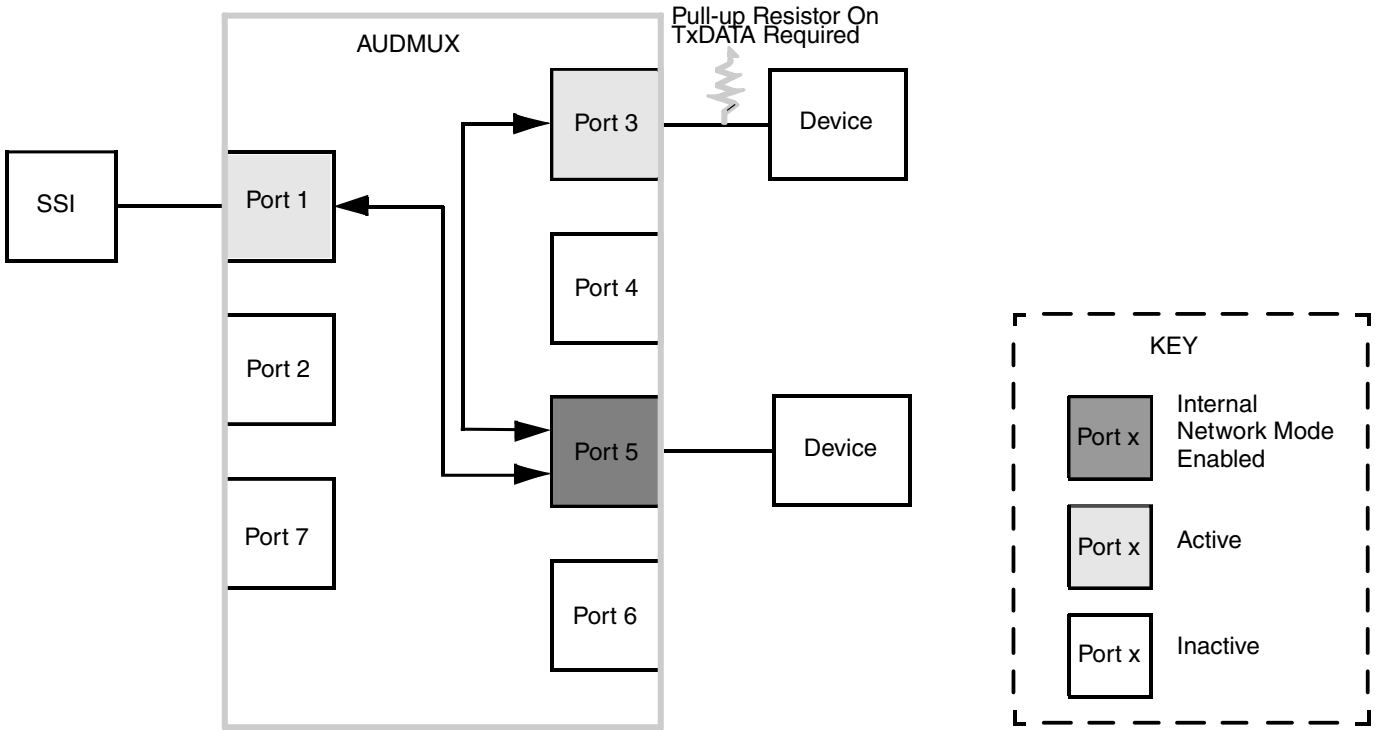

Figure 16-8. Block Diagram For Example 3

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

Rmax = (4 * n + 1) / (2* f_{bc} * C) where:

- n is the number of bits per timeslot
- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the Figure 16-9. This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

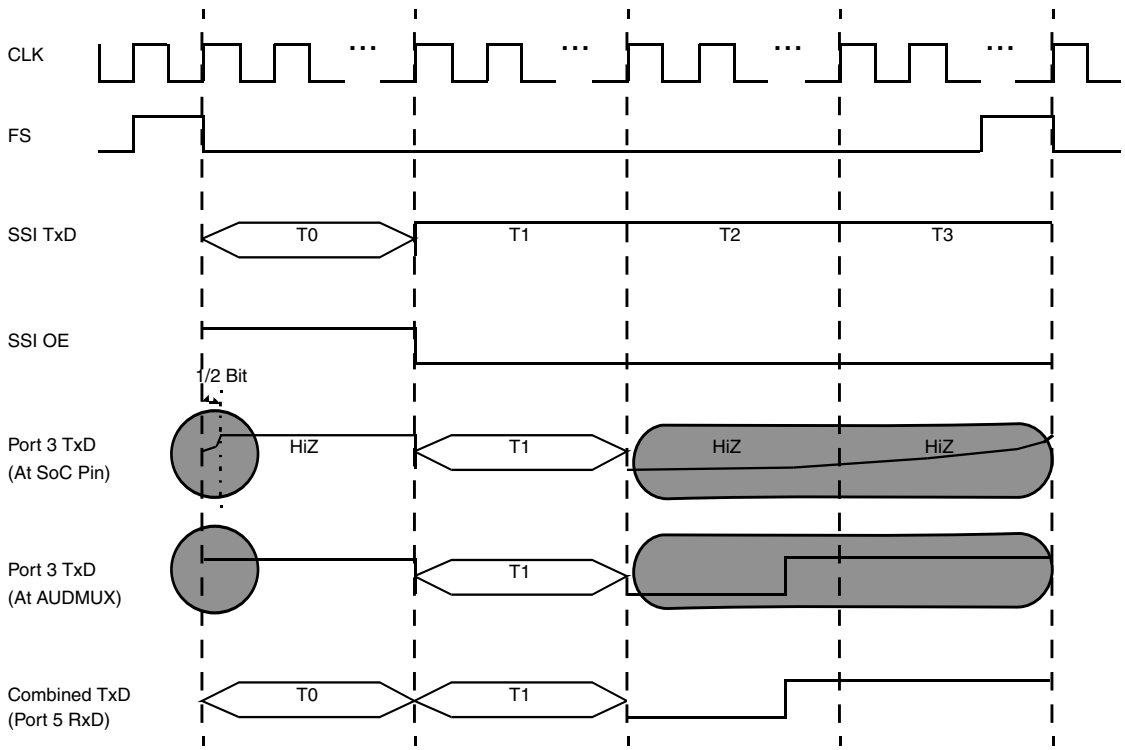

Figure 16-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots

16.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD_obe is always asserted after the port data register configuration.

16.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. RxD_obe is the output buffer enable signal and RxD_out is the data transmit signal from the serial interface. The TxD_in signal is the receive data signal going towards the RXDSEL muxes of all ports.

D_TxRx is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. D_RxTx is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When TXRXEN is disabled (TXRXEN=0), RxD_out is routed to D_TxRx and D_RxTx is routed to TxD_in. The output buffer enable, selected by RXDSEL[2:0], is routed to Db_obe.

When the Tx/Rx switch is enabled (TXRXEN=1), RxD_out is routed to D_RxTx and D_TxRx is routed to TxD_in. The output buffer enable, selected by RXDSEL[2:0], is routed to Da_obe.

If the RXDSELn[2:0] field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by RXDSELn[2:0] and is routed to Da*n*_obe/ Db*n*_obe. In the case when the RXDSELn[2:0] field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to Dan_obe/Dbn_obe, depending on the TXRXENn switch configuration.

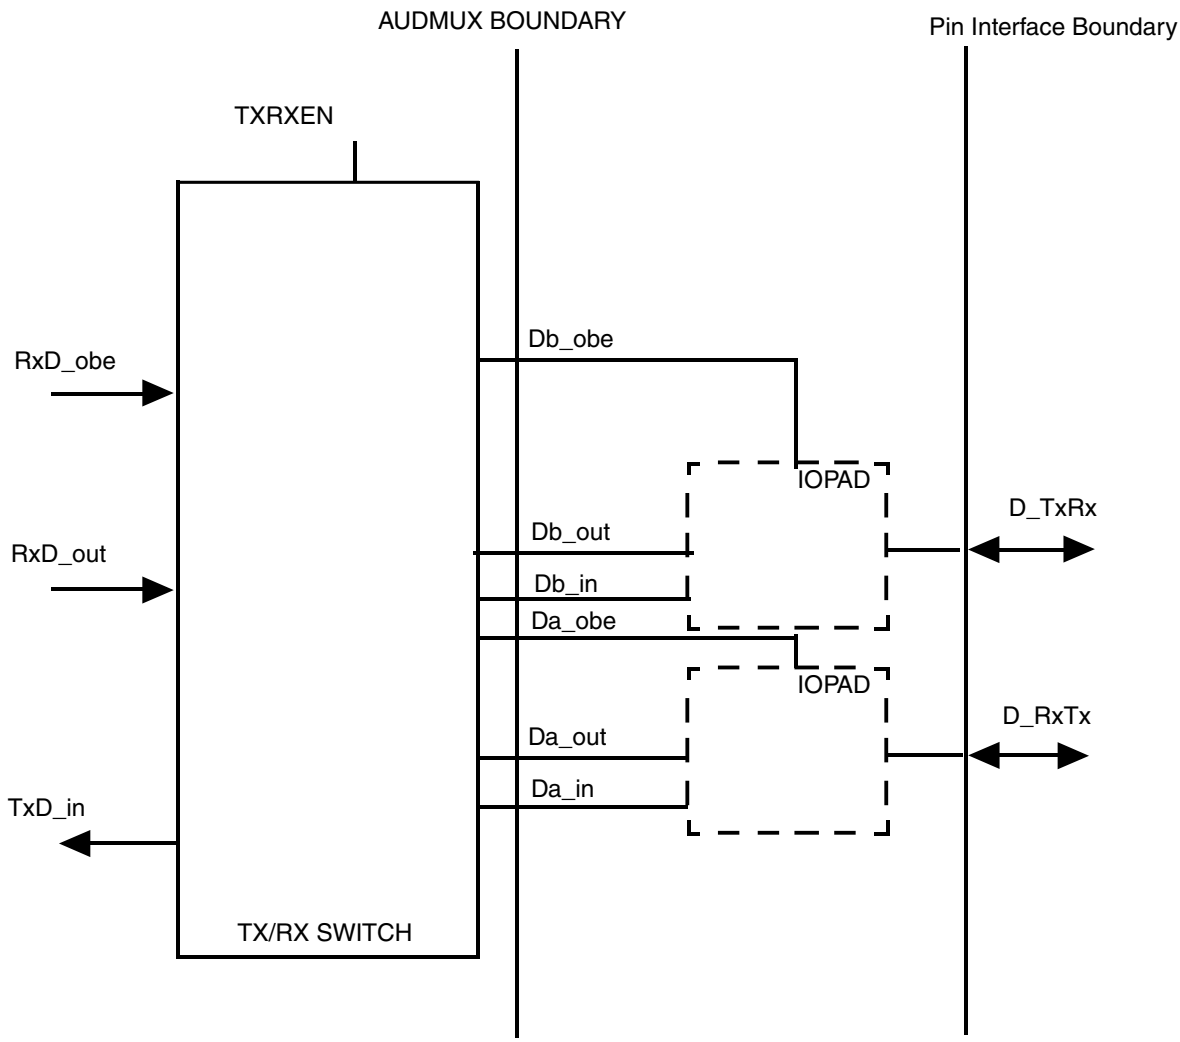

Figure 16-10. Tx/Rx Switch

16.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

16.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When SYN = 1 the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS_in, RFS_in, TCLK_in, and RCLK_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS_out and TCLK_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS_obe and FS_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS_out and RCLK_out pins at Port y are not available.

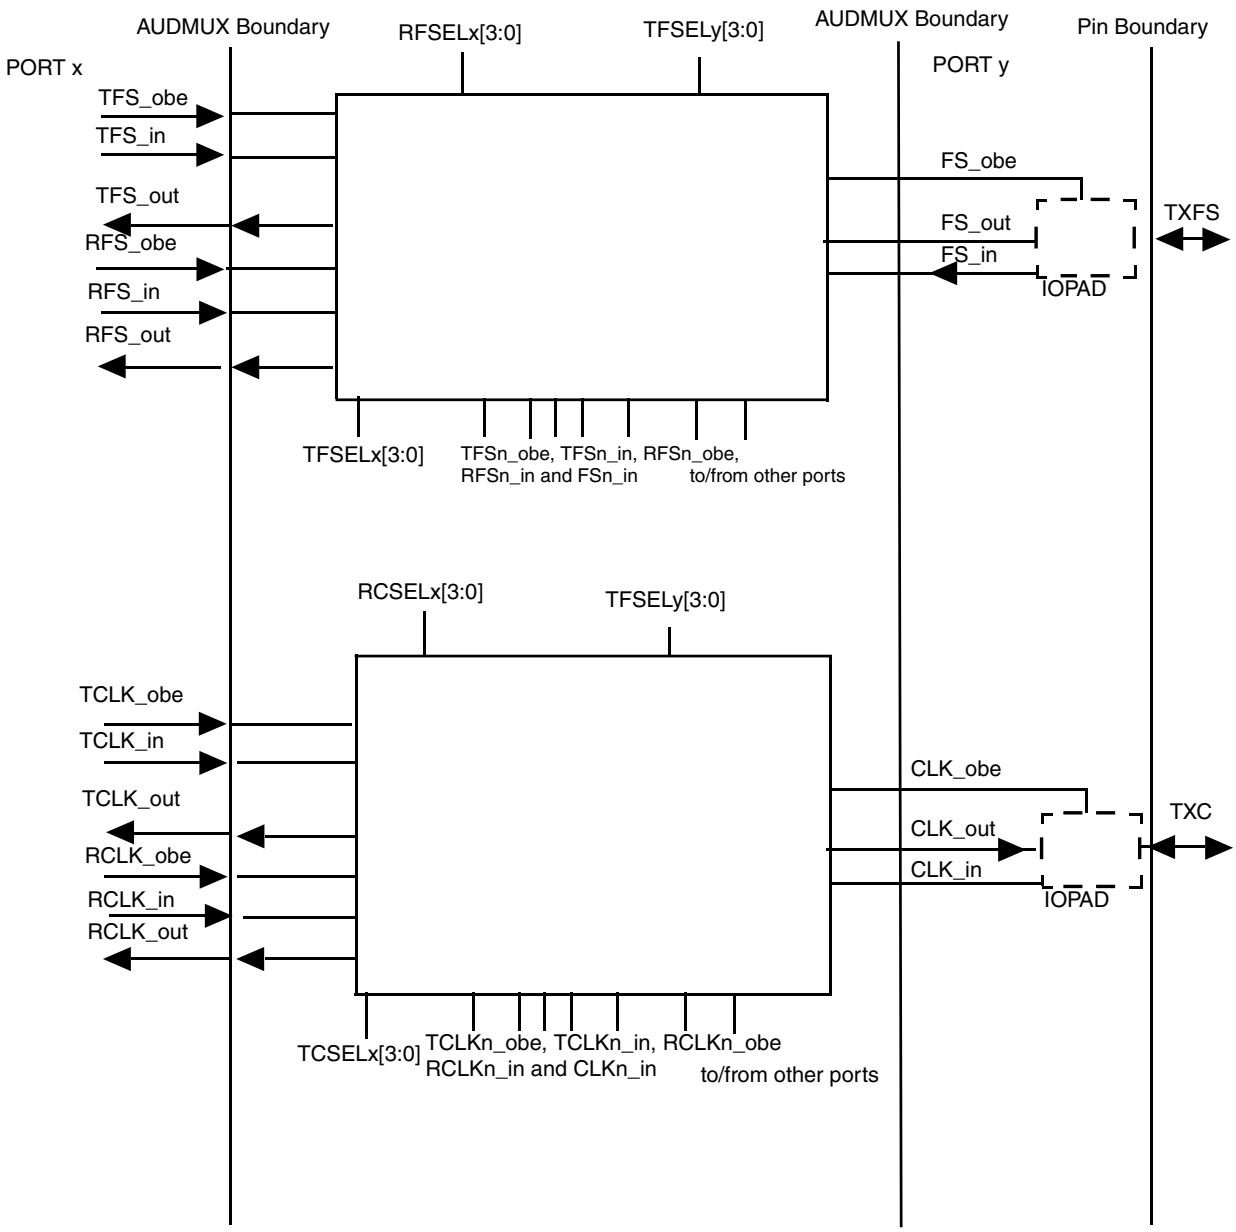

Figure 16-11. Frame Sync and Clock Routing When External Port Is 4-Wire

16.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS_in, RFS_in, TCLK_in, and RCLK_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS_out and TCLK_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS_obe and TxFS_out signals and TCSEL selects the TxCLK_obe and TxClk_out signals. The RFSEL selects the RxFS_obe and RxFS_out signals and RCSEL selects the RxCLK_obe and RxCLK_out signals.

NOTE

Because FS_in and CLK_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

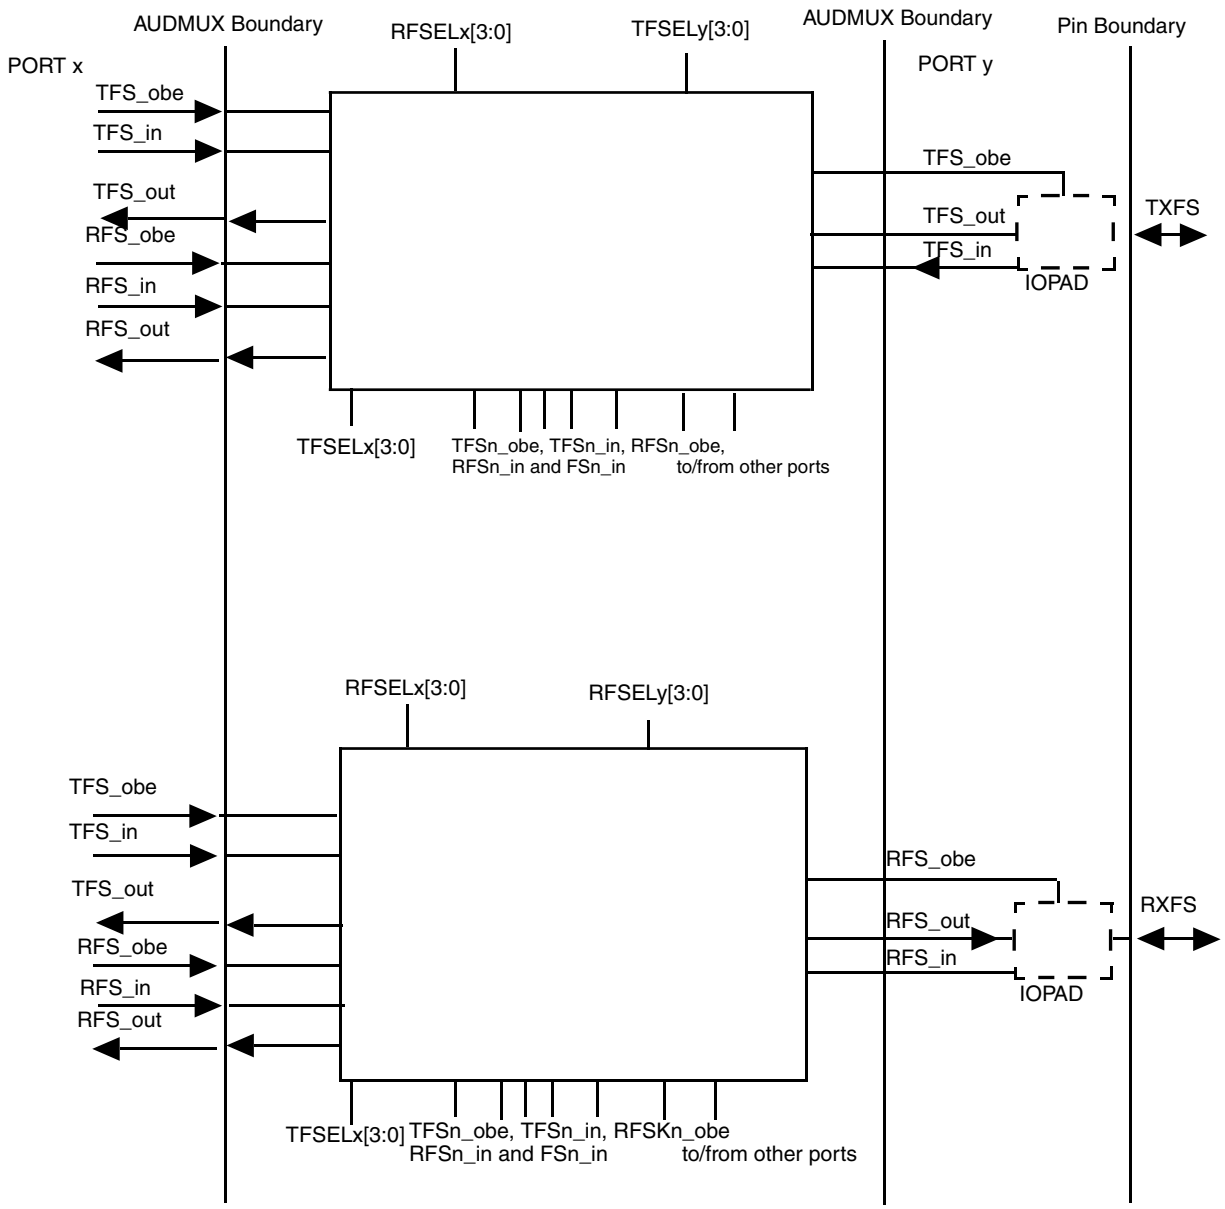

Figure 16-12. Frame Sync Routing When External Port Is 6-Wire

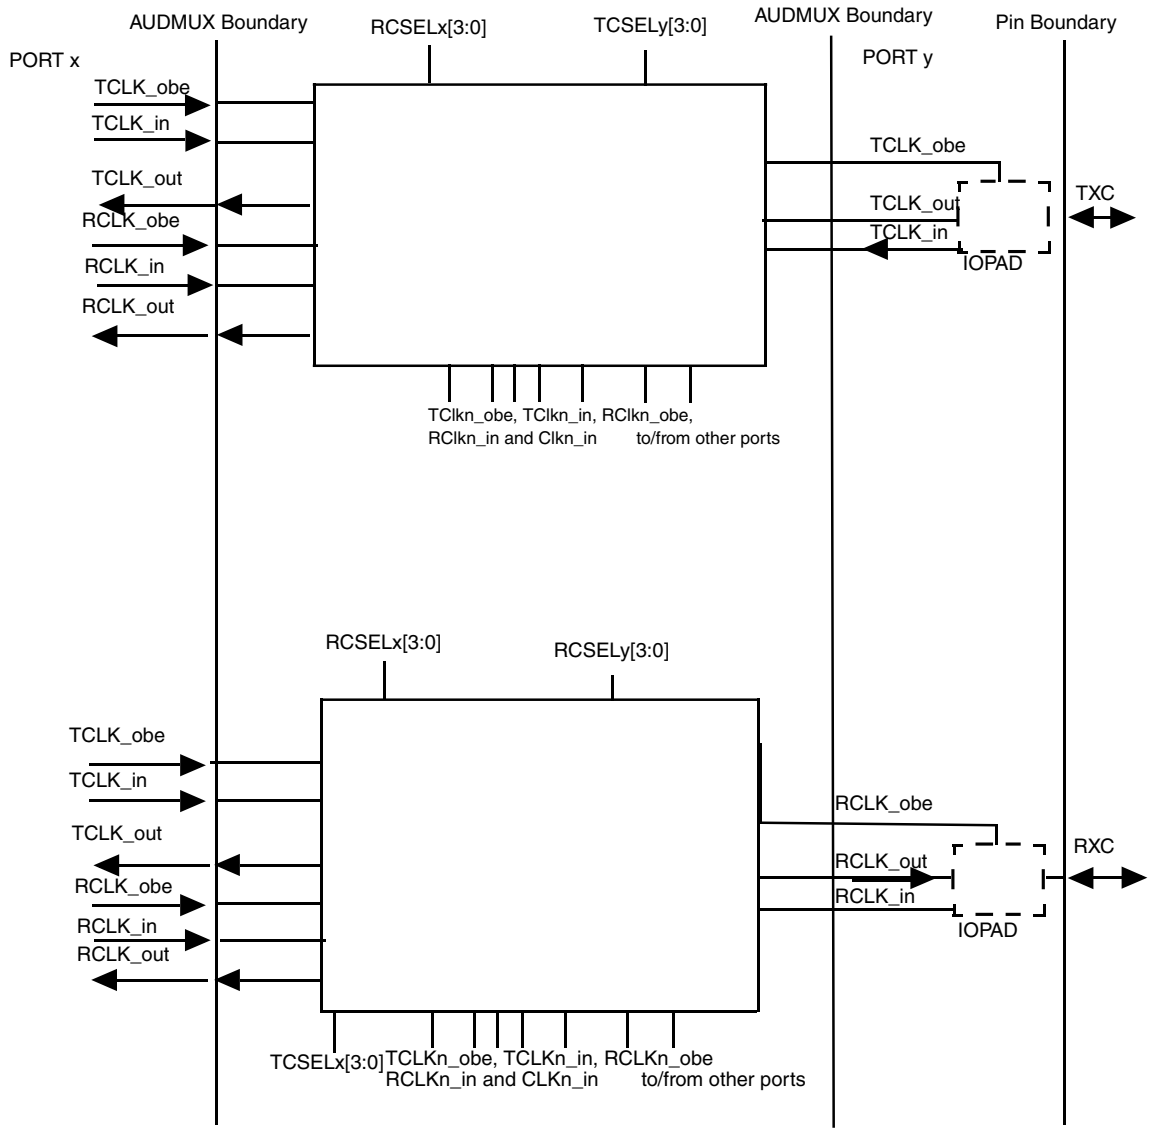

Figure 16-13. Clock Routing When External Port Is 6 Wire

16.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

16.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD_obe is the buffer enable signal from the serial interface, TxD_in is the input transmit data from the serial interface to the AUDMUX, and RxD_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD_obe) and transmit data output (TxD_out) signal from the TxD_obe and RxD_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

NOTE

Because buffer TxD_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD_in, as RxD_out will also drive the RxD_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD_out. RxD_out is routed to Da_TxRx when TXRXEN is disabled and to D_RxTx when TXRXEN is enabled. Similarly, D_RxTx is routed to TxD_in when TXRXEN is disabled and D_TxRx is routed to TxD_in when TXRXEN is enabled. The routing of frame syncs is shown in Figure 16-12 and the routing of interface clocks is shown in Figure 16-10.

If internal network mode is disabled, then RXDSEL selects the TxD_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD_out is constructed by ANDing selected TxD_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D_TxRx and D_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

16.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

16.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

16.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

16.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

AUDMUX memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21D_8000	Port Timing Control Register 1 (AUDMUX_PTCR1)	32	R/W	AD40_0800h	16.6.1/693
21D_8004	Port Data Control Register 1 (AUDMUX_PDCR1)	32	R/W	0000_A000h	16.6.2/695
21D_8008	Port Timing Control Register 2 (AUDMUX_PTCR2)	32	R/W	A500_0800h	16.6.3/696
21D_800C	Port Data Control Register 2 (AUDMUX_PDCR2)	32	R/W	0000_8000h	16.6.4/698
21D_8010	Port Timing Control Register 3 (AUDMUX_PTCR3)	32	R/W	9CC0_0800h	16.6.5/699
21D_8014	Port Data Control Register 3 (AUDMUX_PDCR3)	32	R/W	0000_6000h	16.6.6/701
21D_8018	Port Timing Control Register 4 (AUDMUX_PTCR4)	32	R/W	0000_0800h	16.6.7/702
21D_801C	Port Data Control Register 4 (AUDMUX_PDCR4)	32	R/W	0000_4000h	16.6.8/704
21D_8020	Port Timing Control Register 5 (AUDMUX_PTCR5)	32	R/W	0000_0800h	16.6.9/705
21D_8024	Port Data Control Register 5 (AUDMUX_PDCR5)	32	R/W	0000_2000h	16.6.10/ 707
21D_8028	Port Timing Control Register 6 (AUDMUX_PTCR6)	32	R/W	0000_0800h	16.6.11/ 708
21D_802C	Port Data Control Register 6 (AUDMUX_PDCR6)	32	R/W	0000_0000h	16.6.12/ 710
21D_8030	Port Timing Control Register 7 (AUDMUX_PTCR7)	32	R/W	0000_0800h	16.6.13/ 711

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21D_8034	Port Data Control Register 7 (AUDMUX_PDCR7)	32	R/W	0000_C000h	16.6.14/ 713

16.6.1 Port Timing Control Register 1 (AUDMUX_PTCR1)

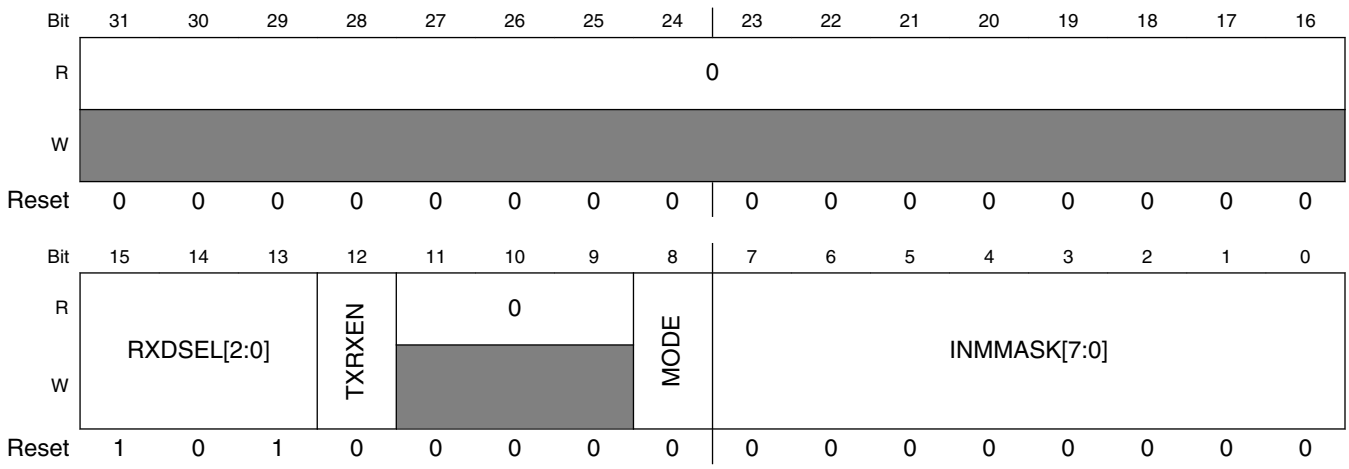
PTCR1 is the Port Timing Control Register for Port 1.

Address: 21D_8000h base + 0h offset = 21D_8000h

AUDMUX_PTCR1 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.

Table continues on the next page...



AUDMUX_PTCR1 field descriptions (continued)

Field	Description
	0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync. 0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock. **NOTE:** RCLKDIR and SYN should not be changed at the same time. 0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
11 SYN	Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface). **NOTE:** RCLKDIR and SYN should not be changed at the same time. 0 Asynchronous mode 1 Synchronous mode (default)
Reserved	This read-only field is reserved and always has the value 0.

16.6.2 Port Data Control Register 1 (AUDMUX_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D_8000h base + 4h offset = 21D_8004h

AUDMUX_PDCR1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled). xxx Port number for RXD 000 Port 1 110 Port 7 111 Reserved
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals. 0 No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1 Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.
8 MODE	Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following: • Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port. • Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together. 0 Normal mode 1 Internal Network mode

Table continues on the next page...

Field	Description
11 SYN	Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface). **NOTE:** RCLKDIR and SYN should not be changed at the same time. 0 Asynchronous mode 1 Synchronous mode (default)
Reserved	This read-only field is reserved and always has the value 0.

16.6.6 Port Data Control Register 3 (AUDMUX_PDCR3)

PDCR3 is the Port Data Control Register for Port 3.

Address: 21D_8000h base + 14h offset = 21D_8014h

AUDMUX_PDCR3 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled). xxx Port number for RXD 000 Port 1 110 Port 7 111 Reserved

Table continues on the next page...

AUDMUX_PDCR3 field descriptions (continued)

Field	Description
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals. 0 No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1 Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.
8 MODE	Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following: • Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port. • Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together. 0 Normal mode 1 Internal Network mode
INMMASK[7:0]	Internal Network Mode Mask. Bit mask that selects the ports from which the RXD signals are to be ANDed together for internal network mode. Bit 6 represents RXD from Port 7 and bit0 represents RXD from Port 1. 0 Includes RXDn for ANDing 1 Excludes RXDn from ANDing

16.6.7 Port Timing Control Register 4 (AUDMUX_PTCR4)

Port Timing Control Register for Port 4

Address: 21D_8000h base + 18h offset = 21D_8018h

Chapter 17
40-BIT Correcting ECC Accelerator (BCH)

17.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 40 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2 to 40 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding MUST be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over GF(2^{13} = 8192) or GF(2^{14} = 16384), which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the GF(8192) or GF(16384) and appending the resulting ***t*** parity symbols to the block to create a BCH codeword (where ***t*** is the number of correctable bits).

The BCH encode process creates *t**13 (or *t**14)-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field. 2**t* syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent 2t-linear equations with 2t-unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial (sigma) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about 7/4 cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately 1/2 cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

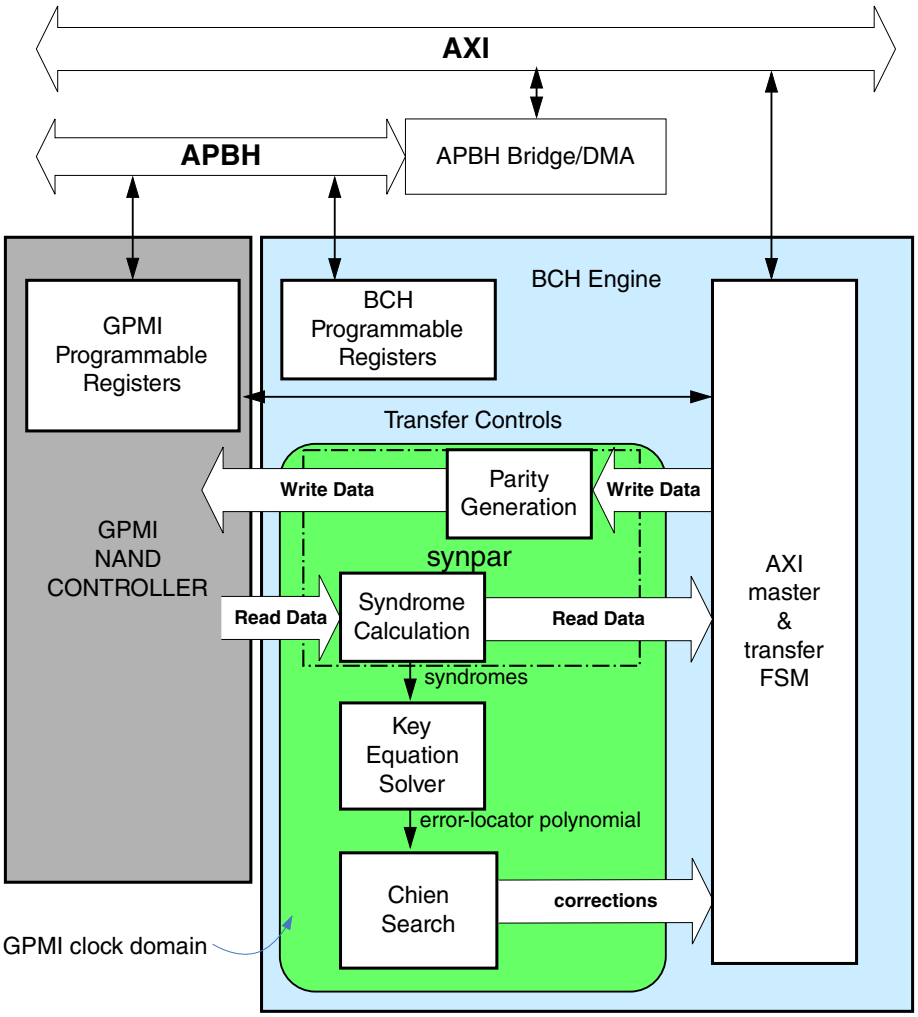

Figure 17-1. Hardware BCH Accelerator

17.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see Flash Page Layout) to specify how data is to be formatted on the flash device. The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

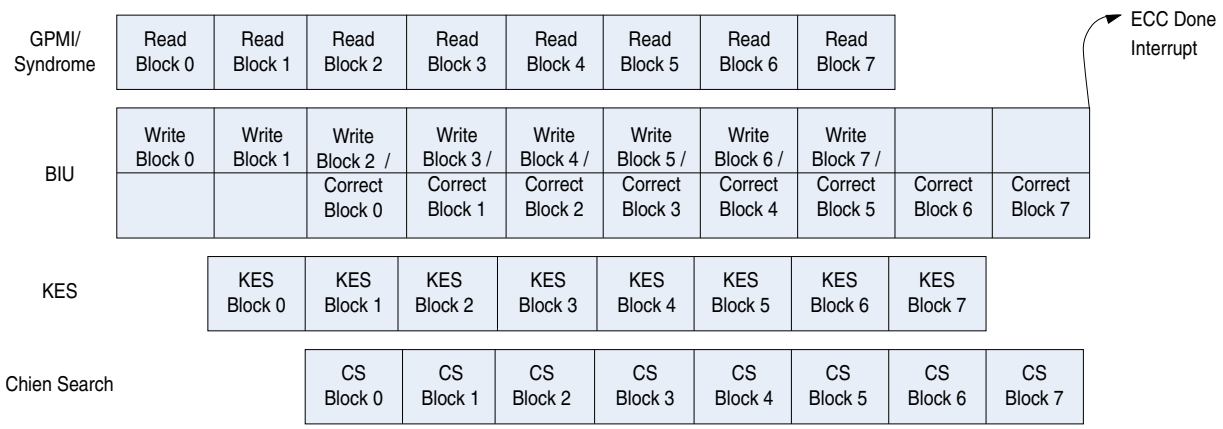

Figure 17-2. Block Pipeline while Reading Flash

17.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2 to 40 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

17.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the BCH_LAYOUTSELECT register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

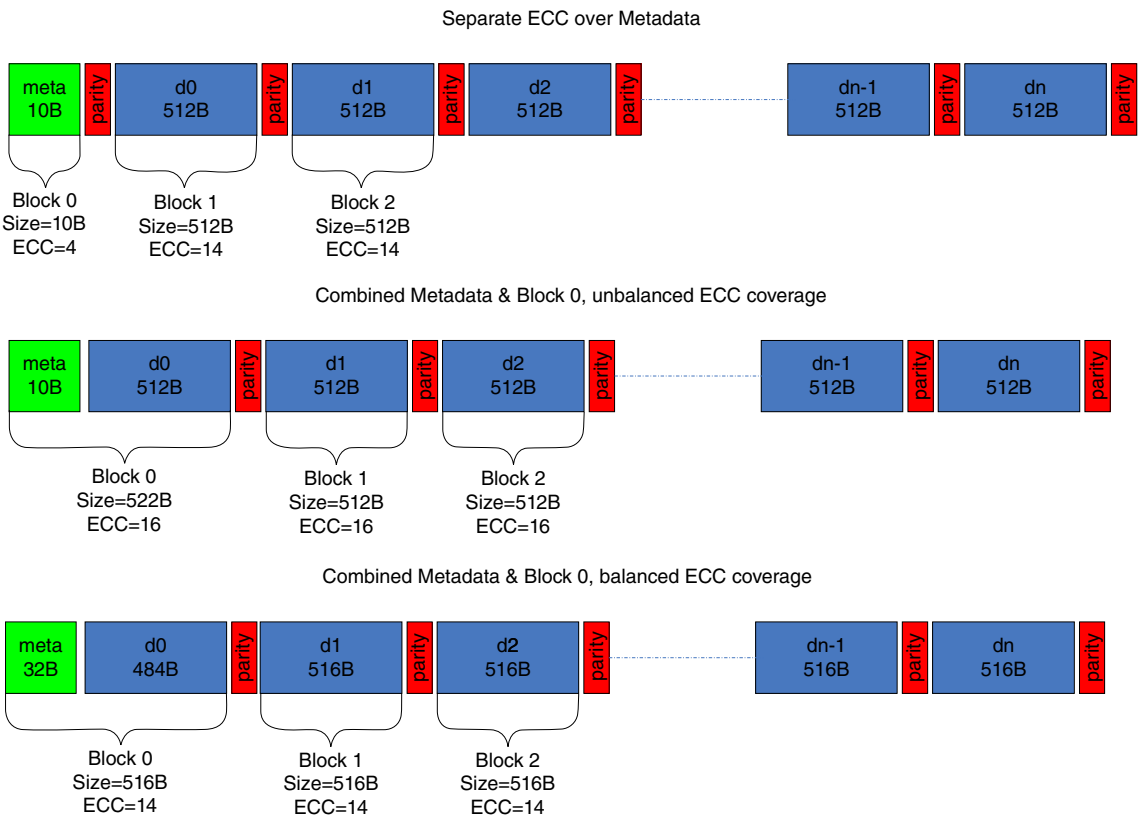

Figure 17-3. FLASH Page Layout Options

Each layout is determined by a pair of registers that define the following parameters:

- DATA0_SIZE: Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- ECC0: Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- META_SIZE: Indicates the number of bytes (from 0-255) that are stored as metadata.
- NBLOCKS: Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- DATAN_SIZE: Indicates the number of data bytes in all subsequent data blocks. This MUST be a multiple of 4 bytes.
- ECCN: Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

17.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for GF(2^{14}))*ECC level ***bits***-- so for ECC8, 13 (or 14) bytes are required (per block).

17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(2^{13})

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes (218 – 10 = 208 bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

(218 - 10) x 8 = 1664/13(8) = 16

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

1664 - (14) x 13 x 8 = 208

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

Table 17-1. Settings for 4K+218 FLASH

Setting	Value
PAGE_SIZE	4096+218=4314=0x10DA
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	16=0x10

Table continues on the next page...

Table 17-1. Settings for 4K+218 FLASH (continued)

Setting	Value
GF0	GF(2^{13})
DATAN_SIZE	512=0x200 (in register interface, assigned as 0x80)
ECCN	14=0x0E
GFN	GF(2^{13})
NBLOCKS	8

17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(2^{13}) for data and GF(2^{14}) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by 4*14 (number of blocks * ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes 944 - 16 * 4 * 14 = 944 - 896 = 48, divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

Table 17-2. Settings for 4K+128 FLASH

Setting	Value
PAGE_SIZE	4096+128=4224=0x1080
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	2
GF0	GF(2^{13})
DATAN_SIZE	1024=0x400 (in register interface, assigned as 0x100)
ECCN	16
GFN	GF(2^{14})
NBLOCKS	4

In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

17.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the GPMI_AUXILIARY register and data will be written to the address specified in the GPMI_PAYLOAD register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the DEBUGSYNDROME bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the STATUS_BLK0 register in the BCH_STATUS register. The completion codes for the blocks are indicated in the Table 17-3. Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.

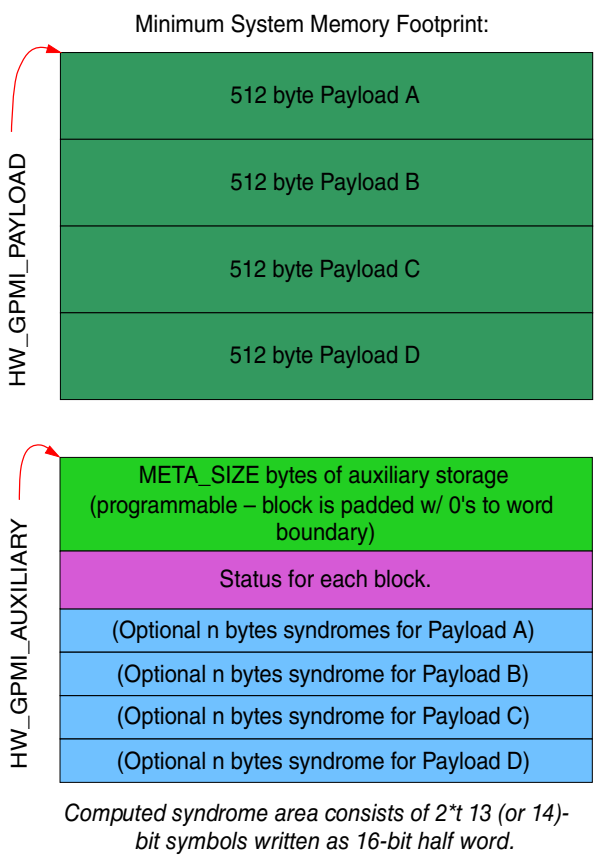

Figure 17-4. BCH Data Buffers in Memory

Table 17-3. Status Block Completion Codes

Code	Description
0xFF	Block is erased
0xFE	Block is uncorrectable
0x00	No errors found
0x01-0x28	Number of errors corrected

The following figure shows the layout of the bytes within the status field.

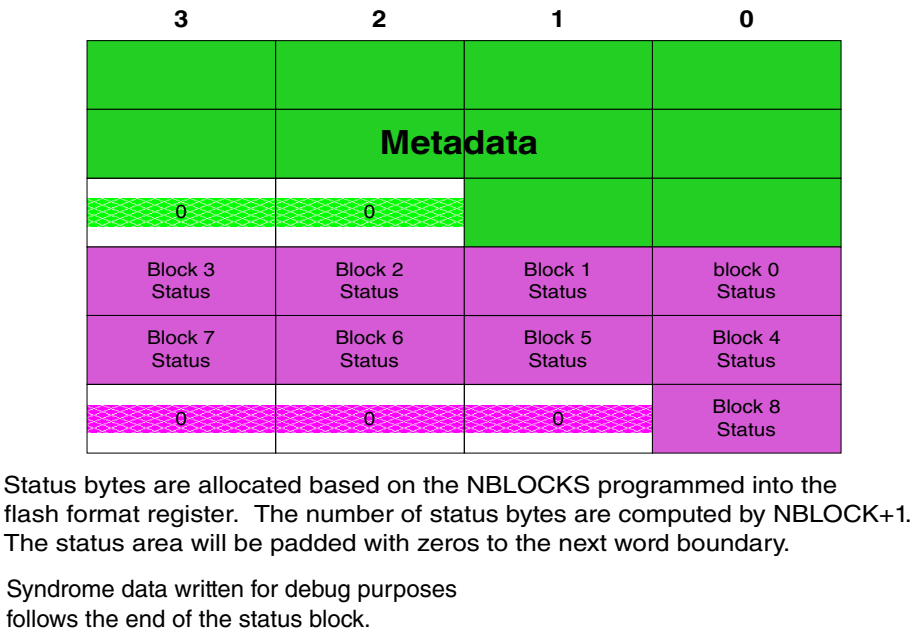

Figure 17-5. Memory-to-Memory Operations

17.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH_DATAPTR and BCH_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M_ENCODE and

M2M_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M_ENCODE bit to 0 while writing the M2M_ENABLE bit. Note that the addresses written to the BCH_DATAPTR, BCH_METAPTR and BCH_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

17.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFTRST and CLKGATE) from the BCH_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD_BUFFER and the metadata will be written to the AUXILIARY_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

17.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in Figure 17-6 shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in Figure 17-8 and detailed in the DMA structure code example that follows it in DMA Structure Code Example. The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

```

17.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```
// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
                   BM_GPMI_CTRL1_BCH_MODE  );    // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff);    // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff);    // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff);    // control bits
PINCTRL_MUXSEL8_SET(0x00015155);    // control bits
```

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produces an interrupt. From the sample code in DMA Structure Code Example :

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

17.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page. This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in Figure 17-10.

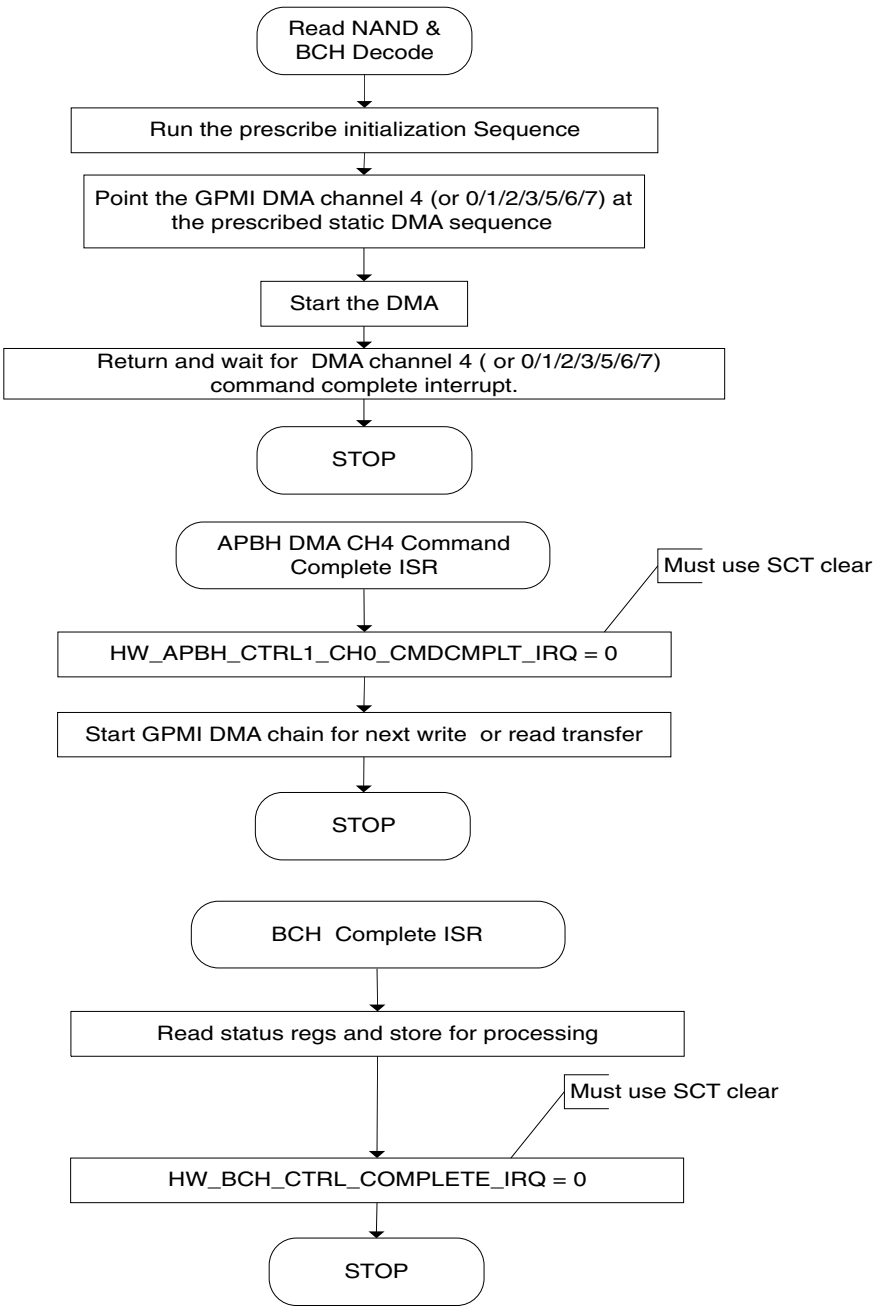

Figure 17-9. BCH Decode Flowchart

Conceptually, an APHB DMA Channel (0,1,2 or 3) command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in Figure 17-10).

Note

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in DMA Structure Code Example. The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to the thread-safe.

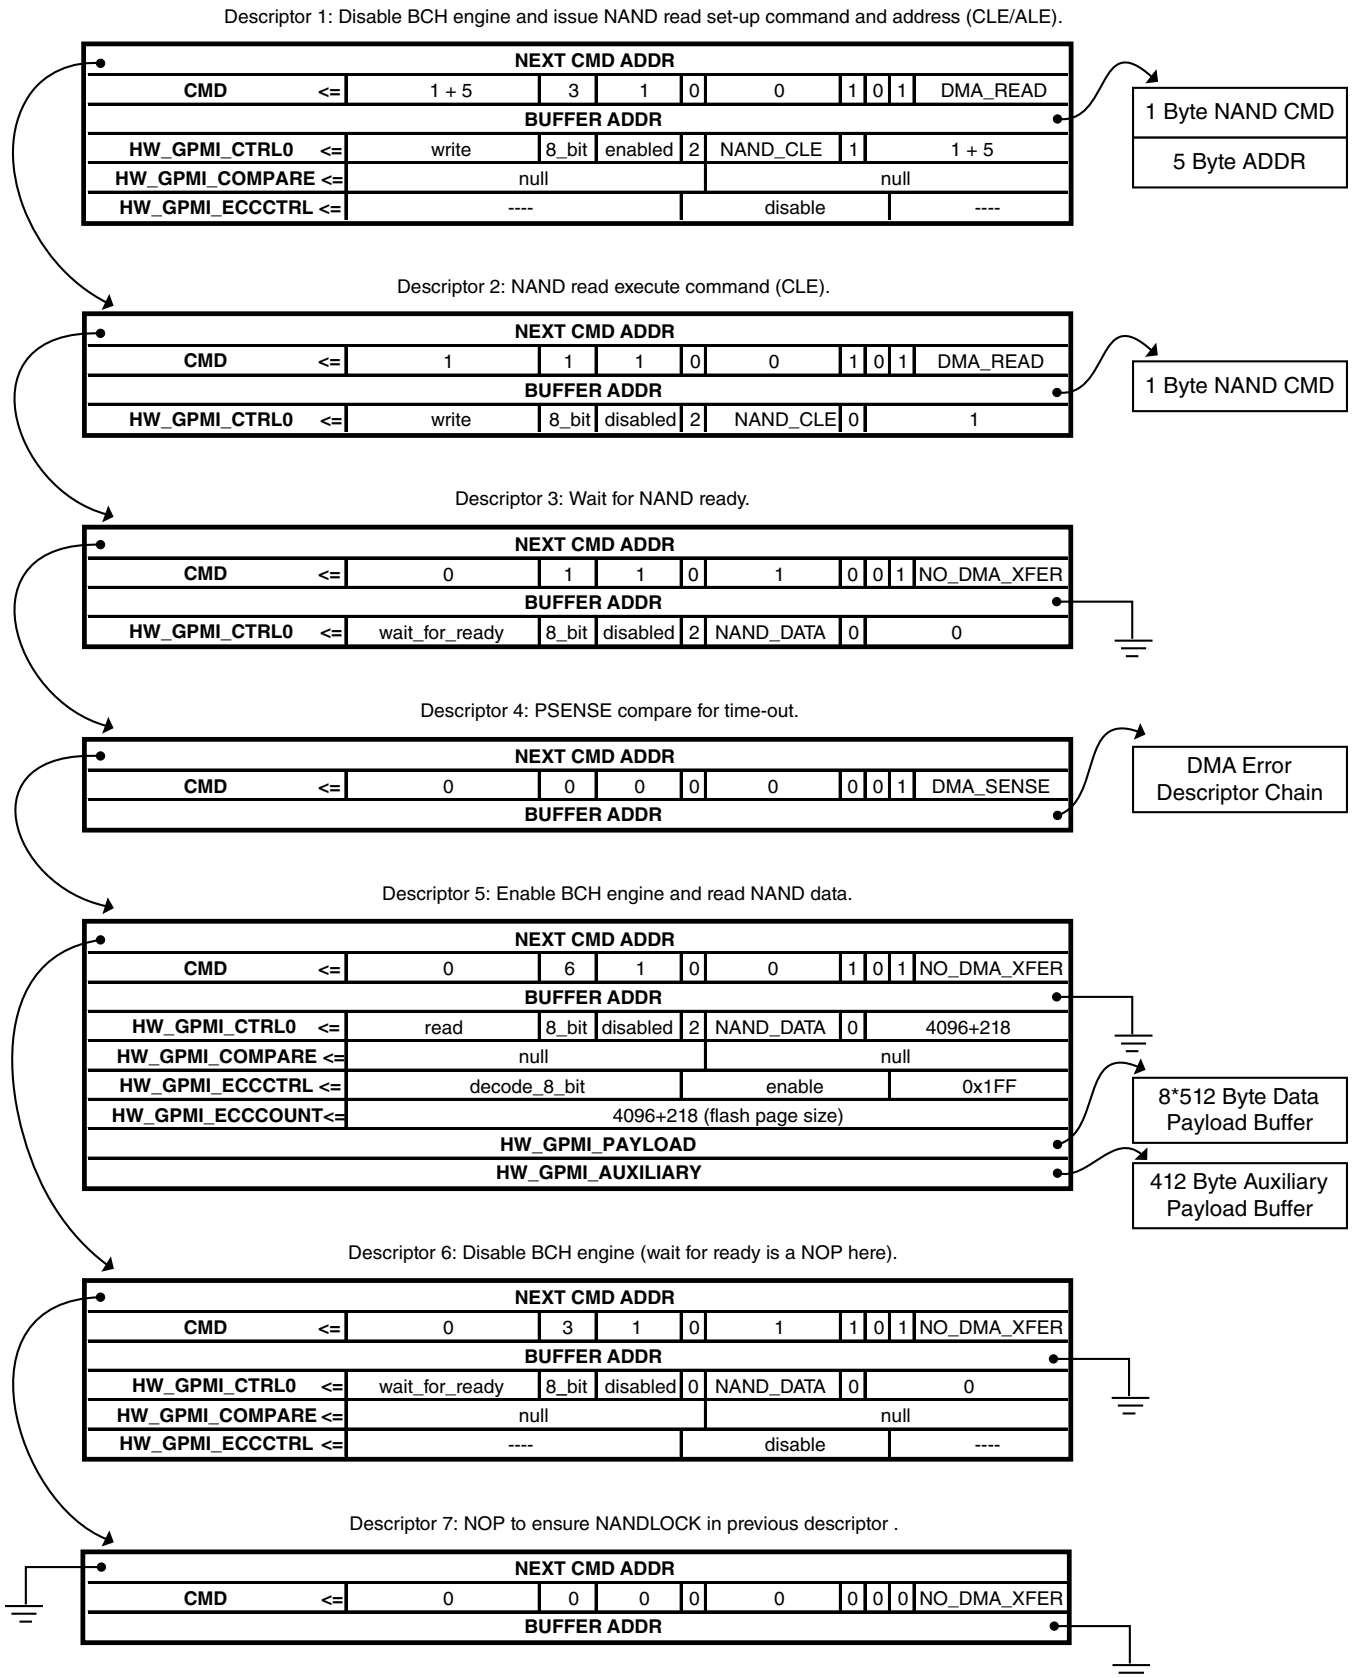

Figure 17-10. BCH Decode DMA Descriptor Chain

17.4.2.1 DMA Structure Code Example

The following sample code illustrates the coding for one read transaction, consisting of a seven DMA command structure chain for reading all 4096 bytes of payload data (eight 512-byte blocks) and 65 bytes of metadata with the associative parity bytes (8 * (18) + 9) from a 4K NAND page sitting on GPMI CS2.

```

17.4.2.2 Using the Decoder

As illustrated in Figure 17-10 and the sample code in DMA Structure Code Example :

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 de-asserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the BCH_CTRL_COMPLETE_IRQ interrupt status bit and the associated status registers in BCH_STATUS0/1 registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The BCH_STATUS0 register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH_STATUS0_COMPLETED_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in Figure 17-10. Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

17.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of Figure 17-6 and Figure 17-9 show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work ***INTO*** the error correction pipeline. As the front end processing completes, the DMA interrupt is

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found int HW_BCH_CTRL_COMPLETE_IRQ.

An BCH transaction consists of reading or writing all of the blocks requested in the HW_GPMI_ECCCTRL_BUFFER_MASK bit field. As every read transaction completes, it posts the status of all of the blocks to the HW_BCH_STATUS0 and HW_BCH_STATUS1 registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the HW_BCH_CTRL_COMPLETE_IRQ bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

17.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically. The example code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
  BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
  BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
  BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
  while (!BCH_CTRL.B.CLKGATE)
```

```
  {
// busy wait
  }
// Done.
  BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
  BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
```

17.6 BCH Memory Map/Register Definition

BCH Hardware Register Format Summary

BCH memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
11_4000	Hardware BCH ECC Accelerator Control Register (BCH_CTRL)	32	R/W	C000_0000h	17.6.1/746

17.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRL*n*)

The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 11_4000h base + 0h offset + (4d × i), where i=0d to 3d

BCH_CTRL*n* field descriptions

Field	Description
31 SFTRST	Set this bit to 0 to enable normal BCH operation. Set this bit to 1 (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine 0x0 **RUN** — Allow BCH to operate normally. 0x1 **RESET** — Hold BCH in reset.
30 CLKGATE	This bit must be set to 0 for normal operation. When set to 1 it gates off the clocks to the block.

Table continues on the next page...

BCH_CTRL*n* field descriptions (continued)

Field	Description
	0x0 **RUN** — Allow BCH to operate normally. 0x1 **NO_CLKS** — Do not clock BCH gates in order to minimize power consumption.
29–23 RSVD5	This field is reserved. This read-only field is reserved and always has the value 0.
22 DEBUGSYNDROME	(For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values.
21–20 RSVD4	This field is reserved. This read-only field is reserved and always has the value 0
19–18 M2M_LAYOUT	Selects the flash page format for memory-to-memory operations.
17 M2M_ENCODE	Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations.
16 M2M_ENABLE	NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPMI) when this bit is set. The M2M_ENCODE and M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit.
15–11 RSVD3	This field is reserved. This read-only field is reserved and always has the value 0
10 DEBUG_STALL_ IRQ_EN	1 = interrupt on debug stall mode is enabled. The IRQ is raised on every block
9 RSVD2	This field is reserved. This read-only field is reserved and always has the value 0.
8 COMPLETE_IRQ_ EN	1 = interrupt on completion of correction is enabled.
7–4 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
3 BM_ERROR_IRQ	AHB Bus interface Error Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
2 DEBUG_STALL_IRQ	DEBUG STALL Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
1 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
0 COMPLETE_IRQ	This bit indicates the state of the external interrupt line. Write a 1 to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0, 1 before clearing this interrupt bit.

17.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0)

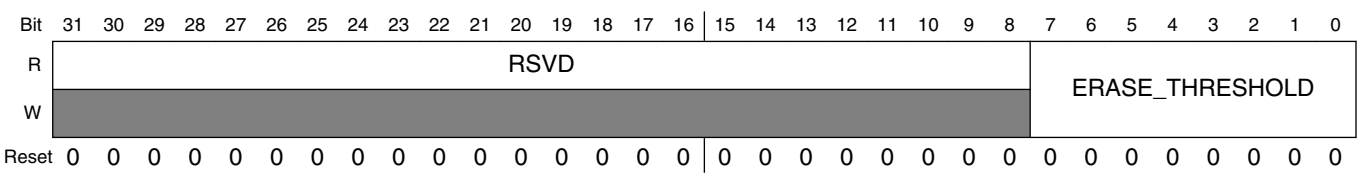
The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

Address: 11_4000h base + 10h offset = 11_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	HANDLE												COMPLETED_CE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STATUS_BLK0								RSVD1			ALLONES	CORRECTED	UNCORRECTABLE	RSVD0	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

BCH_STATUS0 field descriptions



Field	Description
31–20 HANDLE	Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled.
19–16 COMPLETED_CE	This is the chip enable number corresponding to the NAND device from which this data came.
15–8 STATUS_BLK0	Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0. 0x00 **ZERO** — No errors found on block. 0x01 **ERROR1** — One error found on block. 0x02 **ERROR2** — One errors found on block. 0x03 **ERROR3** — One errors found on block. 0x04 **ERROR4** — One errors found on block. 0xFE **UNCORRECTABLE** — Block exhibited uncorrectable errors. 0xFF **ERASED** — Page is erased.
7–5 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
4 ALLONES	1 = All data bits of this transaction are ONE.
3 CORRECTED	1 = At least one correctable error encountered during last processing cycle.
2 UNCORRECTABLE	1 = Uncorrectable error encountered during last processing cycle.
RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.

17.6.3 Hardware ECC Accelerator Mode Register (BCH_MODE)

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 11_4000h base + 20h offset = 11_4020h

BCH_MODE field descriptions

Field	Description
31–8 RSVD	This field is reserved.

Table continues on the next page...

BCH_MODE field descriptions (continued)

Field	Description
	This read-only field is reserved and always has the value 0.
ERASE_ THRESHOLD	This value indicates the maximum number of zero bits on a flash subpage for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF. For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm.

17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 11_4000h base + 30h offset = 11_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_ENCODEPTR field descriptions

Field	Description
ADDR	Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 bytes boundary.

17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 11_4000h base + 40h offset = 11_4040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BCH_DATAPTR field descriptions

Field	Description
ADDR	Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary.

17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 11_4000h base + 50h offset = 11_4050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR

BCH_METAPTR field descriptions

Field	Description
ADDR	Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 bytes boundary.

17.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 11_4000h base + 70h offset = 11_4070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	1	1	1	0	0	1	0	0	1	1	1	0	0	1	0	0

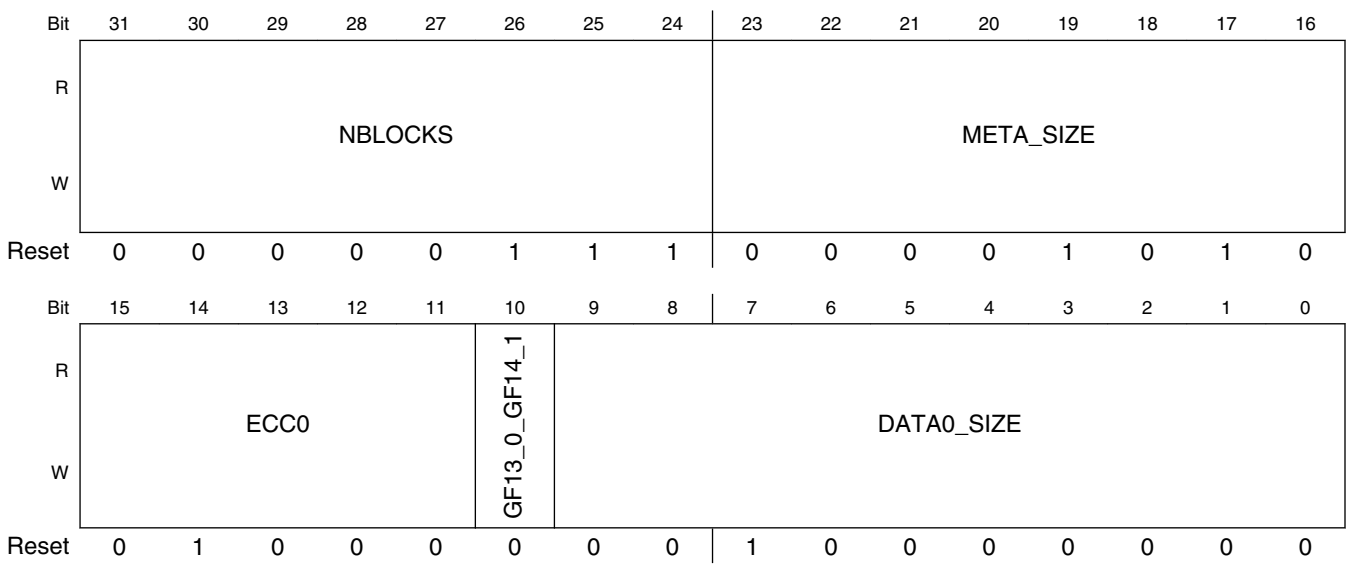
BCH_LAYOUTSELECT field descriptions

Field	Description
31–30 CS15_SELECT	Selects which layout is used for chip select 15.
29–28 CS14_SELECT	Selects which layout is used for chip select 14.
27–26 CS13_SELECT	Selects which layout is used for chip select 13.
25–24 CS12_SELECT	Selects which layout is used for chip select 12.
23–22 CS11_SELECT	Selects which layout is used for chip select 11.
21–20 CS10_SELECT	Selects which layout is used for chip select 10.
19–18 CS9_SELECT	Selects which layout is used for chip select 9.
17–16 CS8_SELECT	Selects which layout is used for chip select 8.
15–14 CS7_SELECT	Selects which layout is used for chip select 7.
13–12 CS6_SELECT	Selects which layout is used for chip select 6.
11–10 CS5_SELECT	Selects which layout is used for chip select 5.
9–8 CS4_SELECT	Selects which layout is used for chip select 4.
7–6 CS3_SELECT	Selects which layout is used for chip select 3.
5–4 CS2_SELECT	Selects which layout is used for chip select 2.
3–2 CS1_SELECT	Selects which layout is used for chip select 1.
CS0_SELECT	Selects which layout is used for chip select 0.



17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

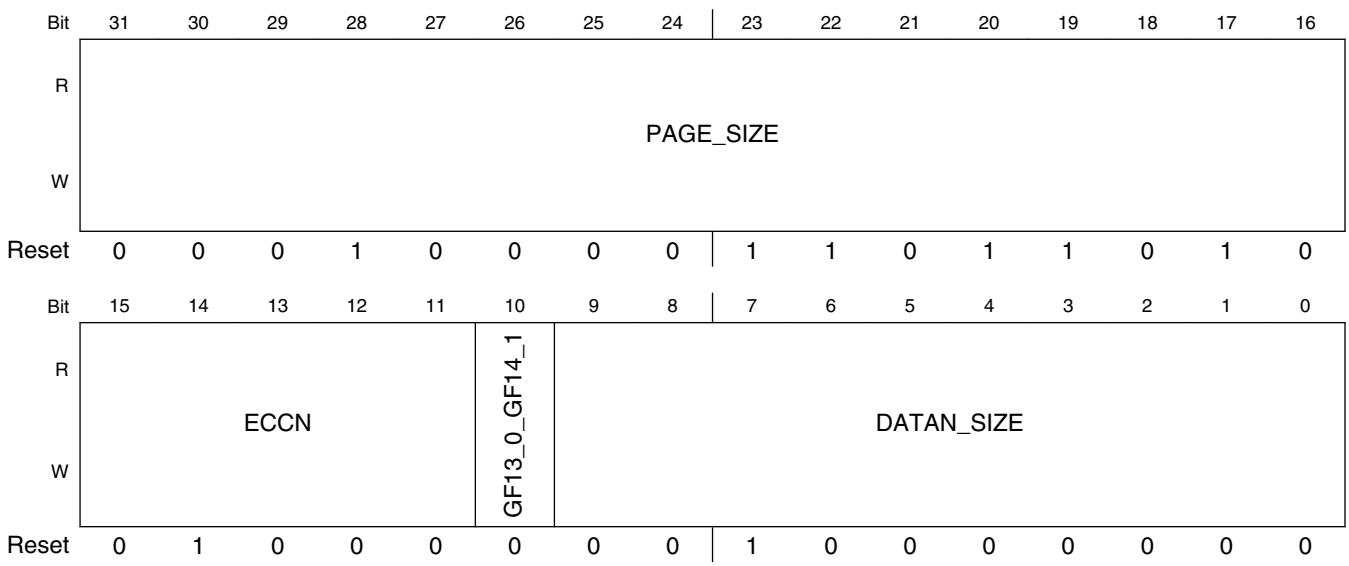
See sections Flash Page Layout and Determining the ECC layout for a device for more detail information on setting up the flash layout registers.

Address: 11_4000h base + 80h offset = 11_4080h

BCH_FLASH0LAYOUT0 field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.

Table continues on the next page...



BCH_FLASH0LAYOUT0 field descriptions (continued)

Field	Description
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATA0_SIZE	Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to 0, the first block only contains metadata.

17.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT0 register to control the format for the device selecting layout 0 in the LAYOUTSELECT register.

Address: 11_4000h base + 90h offset = 11_4090h

BCH_FLASH0LAYOUT1 field descriptions

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed

Table continues on the next page...

BCH_FLASH0LAYOUT1 field descriptions (continued)

Field	Description
	0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See sections Flash Page Layout and Determining the ECC layout for a device for more detail information on setting up the flash layout registers.

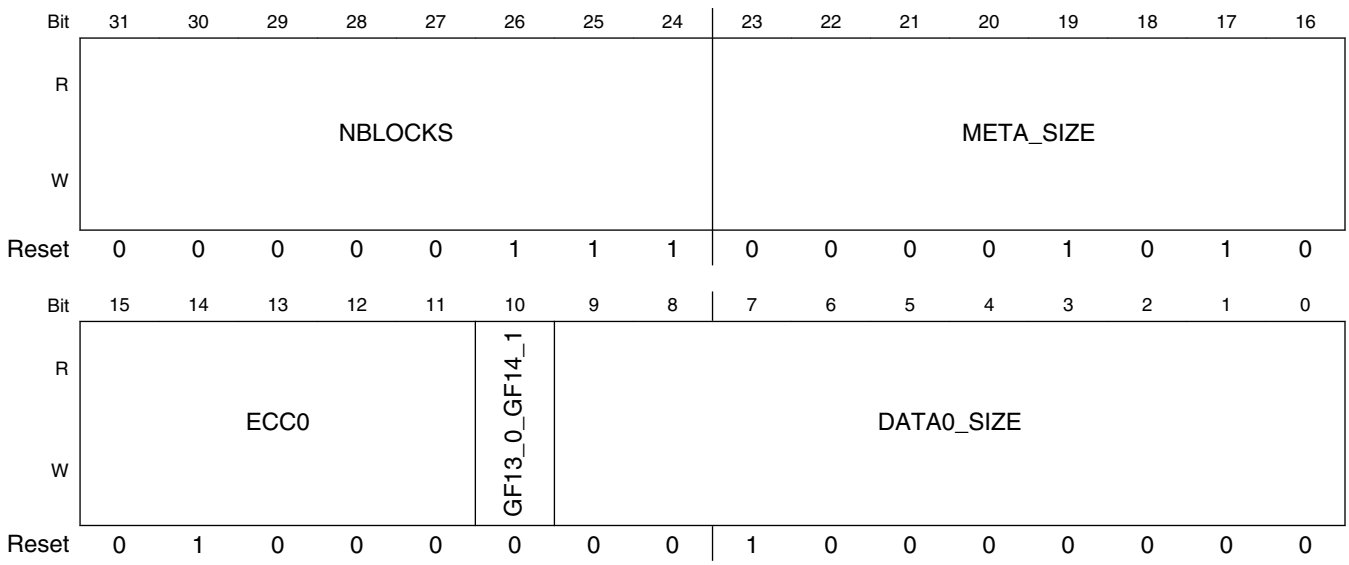
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata).

Table continues on the next page...

BCH_FLASH1LAYOUT1 field descriptions (continued)

Field	Description
	0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.



17.6.12 Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH2LAYOUT1 register to control the format for the devices selecting layout 2 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See sections Flash Page Layout and Determining the ECC layout for a device for more detail information on setting up the flash layout registers.

Address: 11_4000h base + C0h offset = 11_40C0h

BCH_FLASH2LAYOUT0 field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that eight subsequent blocks are present for a total of nine blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed

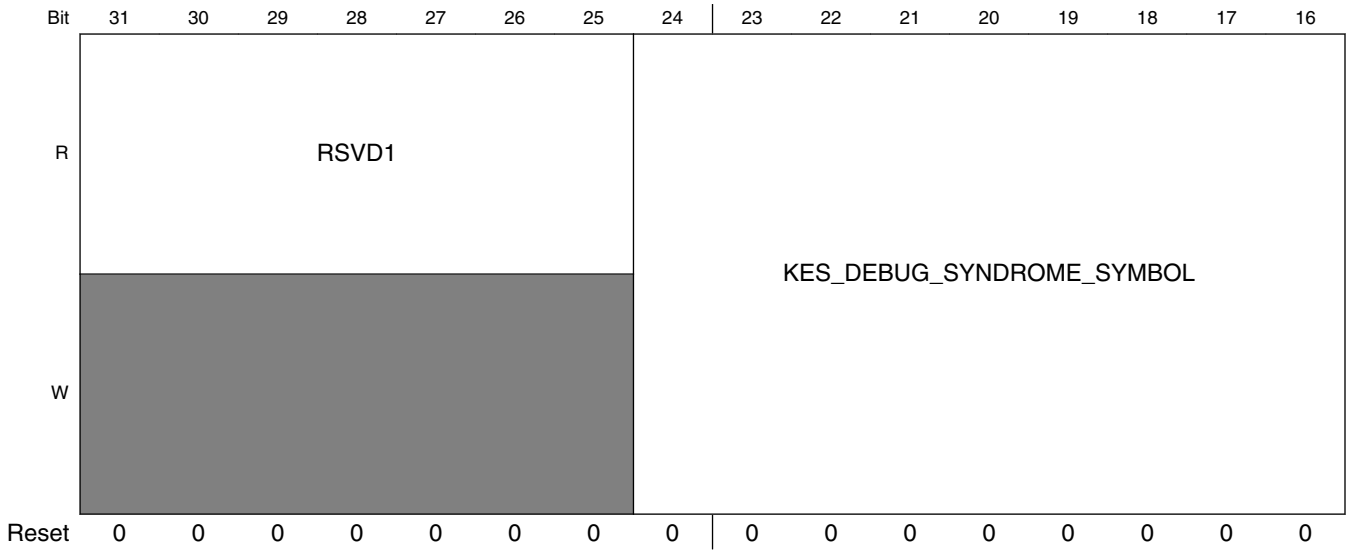
17.6.15 Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1)

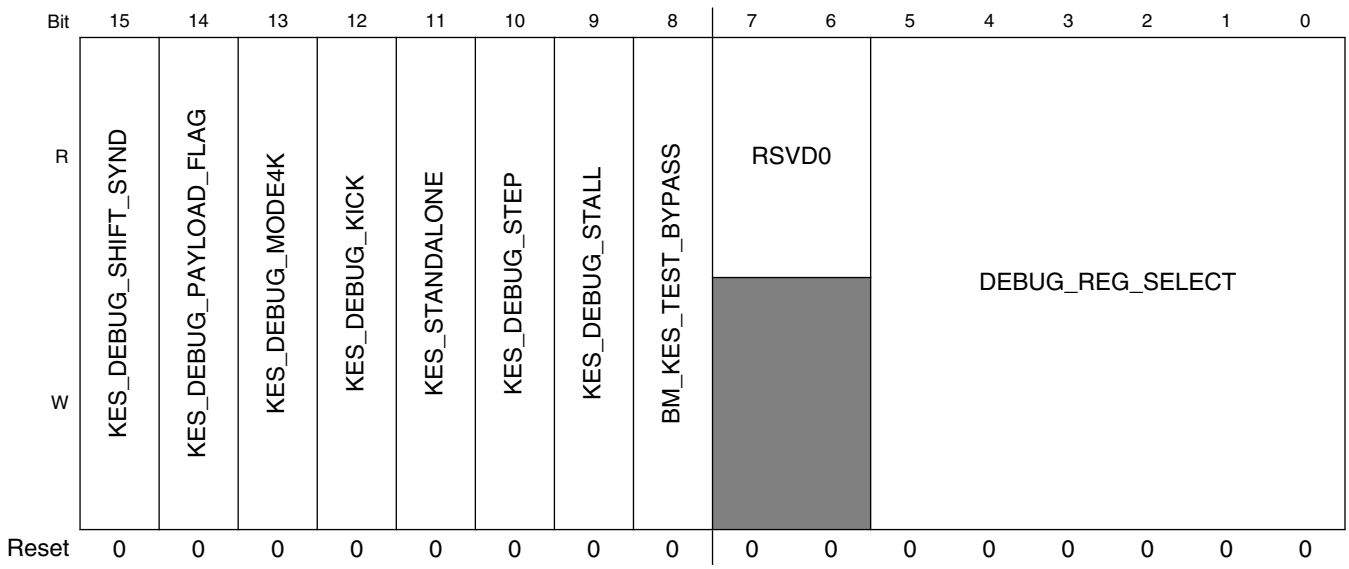
The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH3LAYOUT0 register to control the format for the device selecting layout 3 in the LAYOUTSELECT register.

Address: 11_4000h base + F0h offset = 11_40F0h

BCH_FLASH3LAYOUT1 field descriptions



Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 **NONE** — No ECC to be performed 0x1 **ECC2** — ECC 2 to be performed 0x2 **ECC4** — ECC 4 to be performed 0x3 **ECC6** — ECC 6 to be performed 0x4 **ECC8** — ECC 8 to be performed 0x5 **ECC10** — ECC 10 to be performed 0x6 **ECC12** — ECC 12 to be performed 0x7 **ECC14** — ECC 14 to be performed 0x8 **ECC16** — ECC 16 to be performed 0x9 **ECC18** — ECC 18 to be performed 0xA **ECC20** — ECC 20 to be performed 0xB **ECC22** — ECC 22 to be performed 0xC **ECC24** — ECC 24 to be performed 0xD **ECC26** — ECC 26 to be performed 0xE **ECC28** — ECC 28 to be performed 0xF **ECC30** — ECC 30 to be performed 0x10 **ECC32** — ECC 32 to be performed 0x11 **ECC34** — ECC 34 to be performed 0x12 **ECC36** — ECC 36 to be performed 0x13 **ECC38** — ECC 38 to be performed 0x14 **ECC40** — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.



17.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0*n*)

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

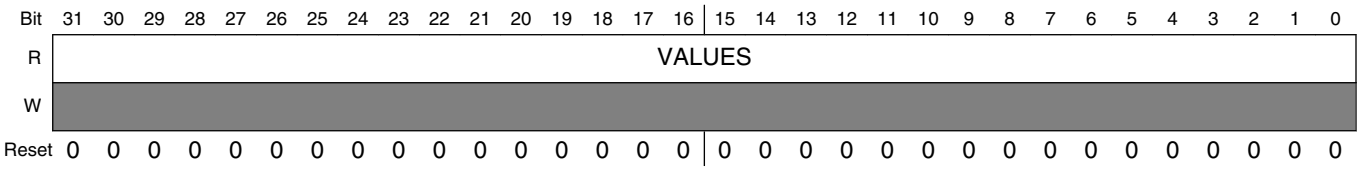
The BCH_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

Address: 11_4000h base + 100h offset + (4d × i), where i=0d to 3d

BCH_DEBUG0*n* field descriptions

Field	Description
31–25 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
24–16 KES_DEBUG_ SYNDROME_ SYMBOL	The 9 bit value in this bit field shifts into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
15 KES_DEBUG_ SHIFT_SYND	Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Make sure that set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.

Table continues on the next page...



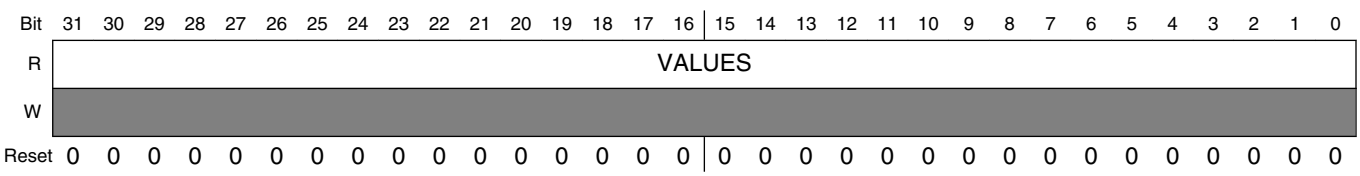
BCH_DEBUG0*n* field descriptions (continued)

Field	Description
14 KES_DEBUG_ PAYLOAD_FLAG	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag. 0x1 **DATA** — Payload is set for 512 bytes data block. 0x1 **AUX** — Payload is set for 65 or 19 bytes auxiliary block.
13 KES_DEBUG_ MODE4K	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages). 0x1 **4k** — Mode is set for 4K NAND pages. 0x1 **2k** — Mode is set for 2K NAND pages.
12 KES_DEBUG_ KICK	Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
11 KES_ STANDALONE	Set to one, cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and suppress toggling the CF_BM_DONE signal by the CF engine. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
10 KES_DEBUG_ STEP	Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and completed processing a block.
9 KES_DEBUG_ STALL	Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so it's state can be examined after it finishes processing the KES stalled block. 0x0 **NORMAL** — KES FSM proceeds to next block supplied by bus master. 0x1 **WAIT** — KES FSM waits after current equations are solved and the search engine is started.
8 BM_KES_TEST_ BYPASS	1 = Point all SYND_GEN writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine. 0x0 **NORMAL** — Bus master address generator for SYND_GEN writes operates normally. 0x1 **TEST_MODE** — Bus master address generator always addresses last four bytes in Auxiliary block.
7–6 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
DEBUG_REG_ SELECT	The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine.

17.6.17 KES Debug Read Register (BCH_DBGKESREAD)

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

Address: 11_4000h base + 110h offset = 11_4110h



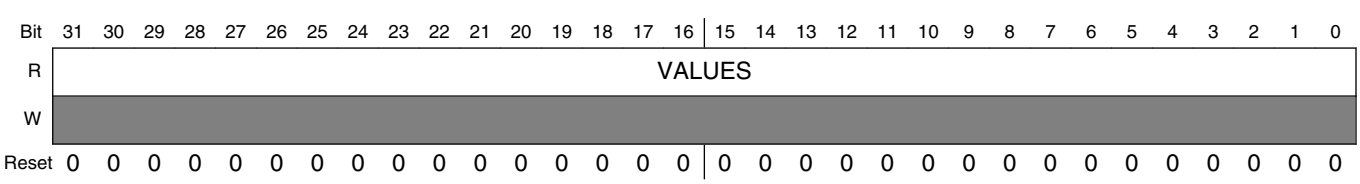
BCH_DBGKESREAD field descriptions

Field	Description
VALUES	This register returns the ROM BIST CRC value after a BIST test.

17.6.18 Chien Search Debug Read Register (BCH_DBGCSFEREAD)

The hardware BCH ECC accelerator Chien Search internal state machines and signals can be seen in the ECC debug registers.

Address: 11_4000h base + 120h offset = 11_4120h



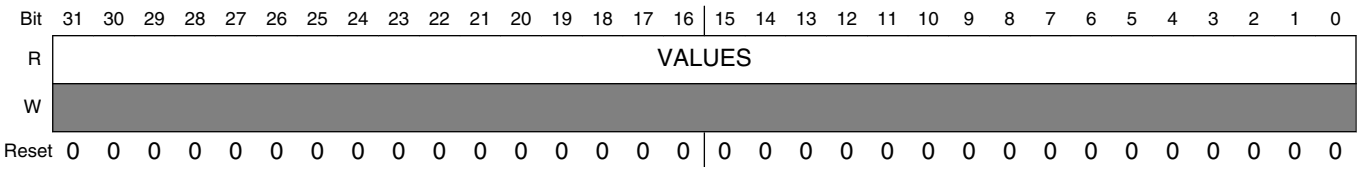
BCH_DBGCSFEREAD field descriptions

Field	Description
VALUES	Reserved

17.6.19 Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD)

The hardware BCH ECC accelerator syndrome generator internal state machines and signals can be seen in the ECC debug registers.

Address: 11_4000h base + 130h offset = 11_4130h



BCH_DBGSYNDGENREAD field descriptions

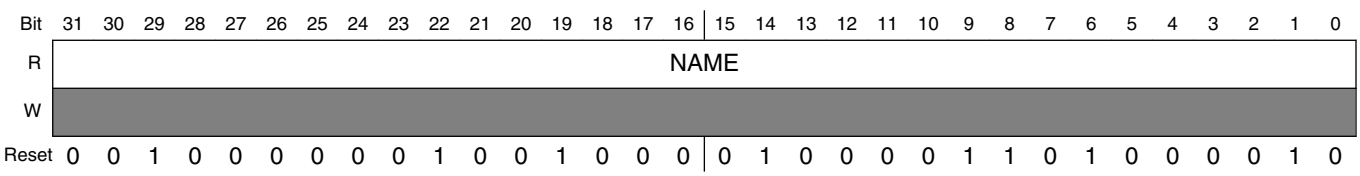
Field	Description
VALUES	Reserved

17.6.20 Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD)

The hardware BCH ECC accelerator bus master, ECC controller internal state machines, and signals can be seen in the ECC debug registers.

Address: 11_4000h base + 140h offset = 11_4140h

BCH_DBGAHBMREAD field descriptions



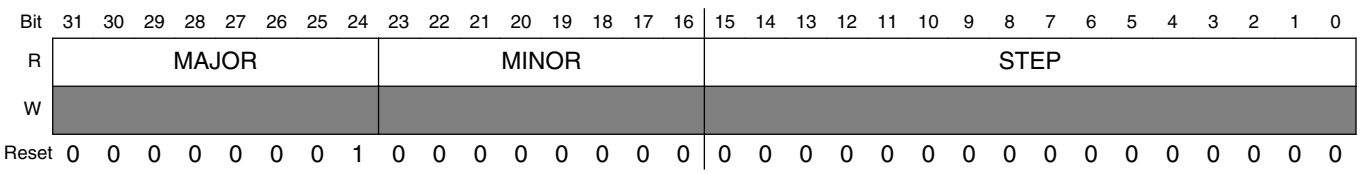
Field	Description
VALUES	Reserved

17.6.21 Block Name Register (BCH_BLOCKNAME)

Read only view of the block name string BCH.

Fixed pattern read only value is for test purposes. It can be read as an ASCII string with the zero termination coming from the first byte of the BLOCKVERSION register.

Address: 11_4000h base + 150h offset = 11_4150h



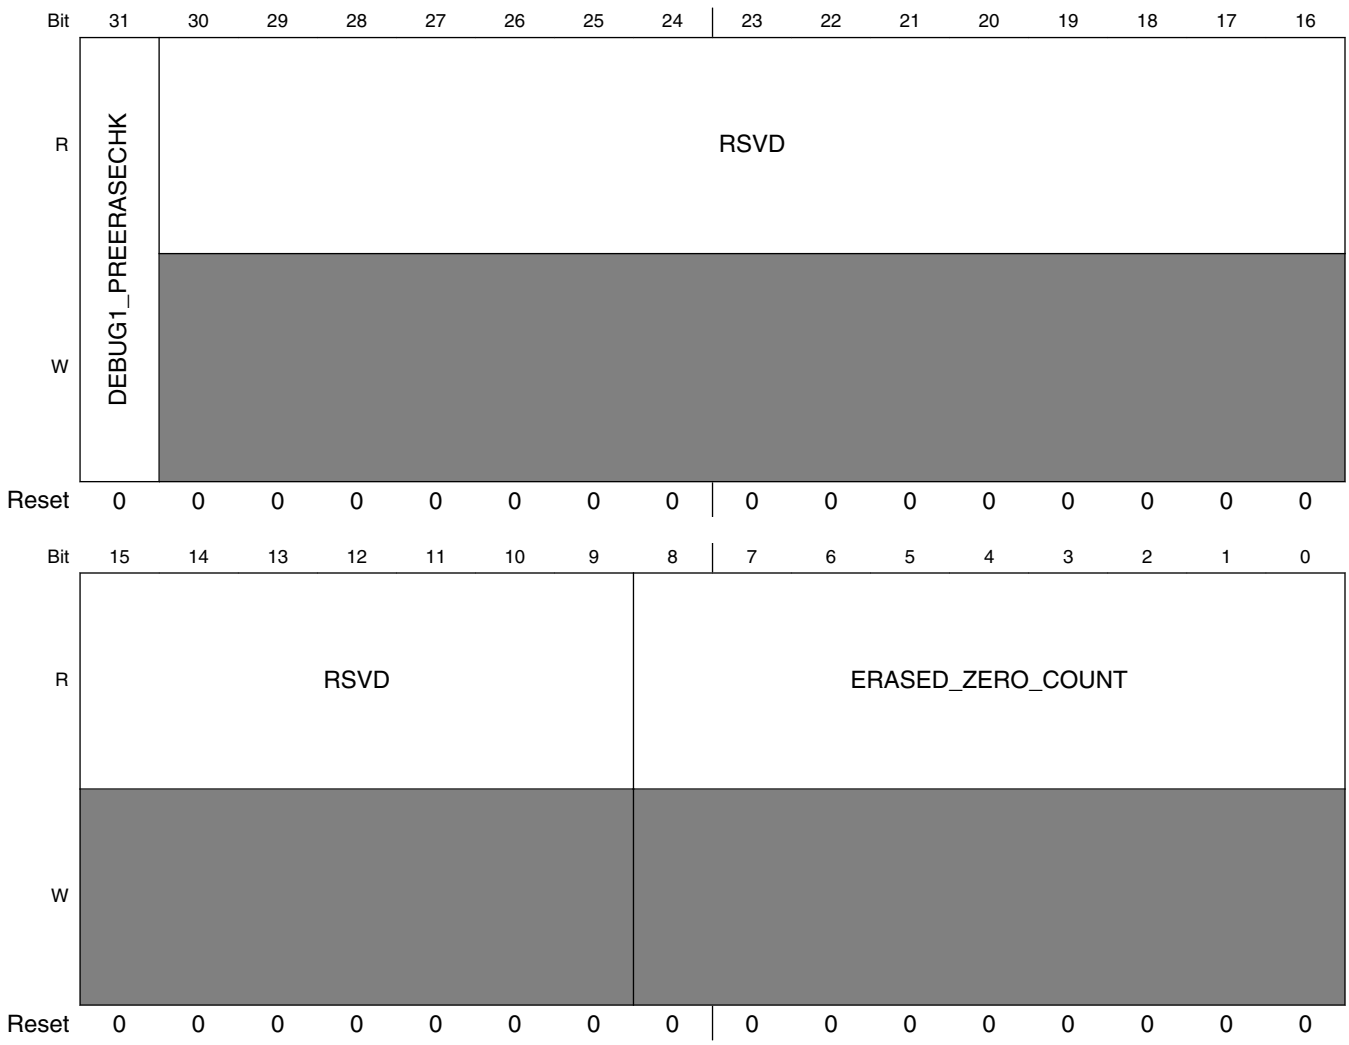
BCH_BLOCKNAME field descriptions

Field	Description
NAME	The name is in the ASCII characters BCH (0x20, H, C, B).

17.6.22 BCH Version Register (BCH_VERSION)

This register always returns a known read value for debug purposes and indicates the version of the block and RTL version in use.

Address: 11_4000h base + 160h offset = 11_4160h



BCH_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value indicates the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value indicates the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

17.6.23 Hardware BCH ECC Debug Register 1 (BCH_DEBUG1)

The BCH_DEBUG1 register provides erased zero count information and pre-erase check.

Address: 11_4000h base + 170h offset = 11_4170h

BCH_DEBUG1 field descriptions

Field	Description
31 DEBUG1_ PREERASECHK	Blank page enables pre-erase check. 0x0 Turn off pre-erase check 0x1 Turn on pre-erase check
30–9 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

BCH_DEBUG1 field descriptions (continued)

Field	Description
ERASED_ ZERO_COUNT	The zero counts on one page.

Chapter 18
Clock Controller Module (CCM)

18.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
  - PLL8 also referenced as MLB PLL
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

18.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- Arm core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM_CLKO1 and CCM_CLKO2 onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for Arm core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

18.1.2 CCM Block Diagram

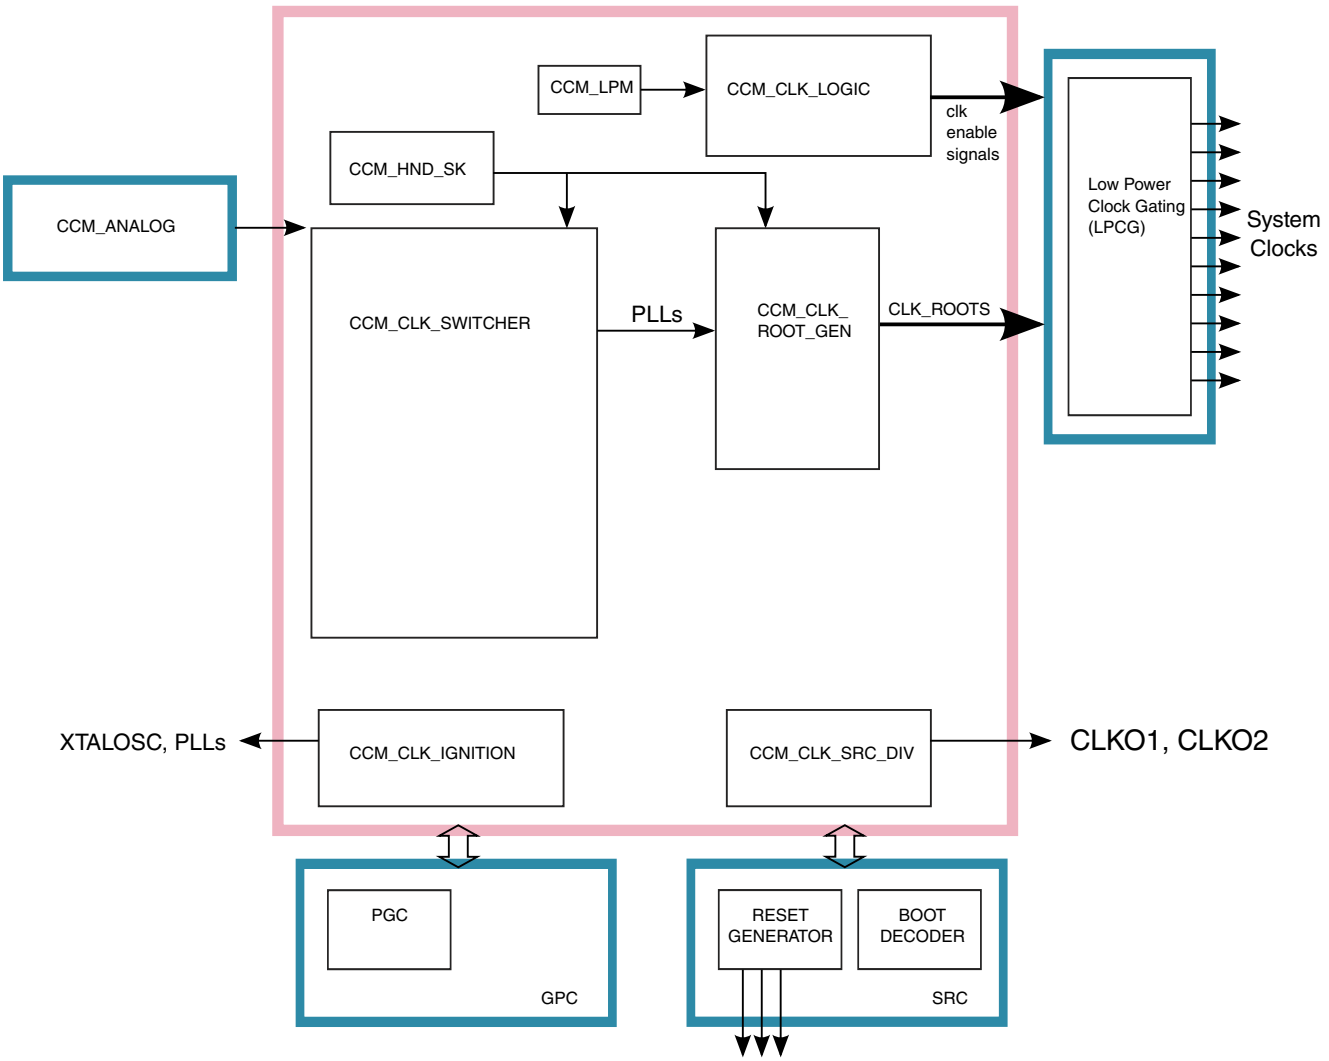


Figure 18-1. Block Diagram

CCM contains the following sub-blocks:

Table 18-1. CCM Sub-blocks

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality after CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

Table 18-1. CCM Sub-blocks (continued)

CCM_CLK_SRC_DIV Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_CLK_SRC_DIV	Muxes different clocks to two output clocks, CCM_CLKO1 and CCM_CLKO2, for observability. These output clocks are connected to the pads and can provide support for testing.
CCM_HND_SK	Manages the handshake when changing certain root clock dividers that require handshake.

18.2 External Signals

The following table describes the external signals of CCM:

Table 18-2. CCM External Signals

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	CSI0_MCLK	ALT3	O
		GPIO_0	ALT0	
		GPIO_19	ALT3	
		GPIO_5	ALT3	
CCM_CLKO2	Observability clock 2 output	GPIO_3	ALT4	O
		NANDF_CS2	ALT4	
CCM_PMIC_STBY_REQ	Goes to PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	PMIC_STBY_REQ	No Muxing (ALT0)	O
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO_9	ALT3	O
CCM_PLL3_BYP	PLL3 bypass clock	RGMII_TD1	ALT7	I

18.3 CCM Clock Tree

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

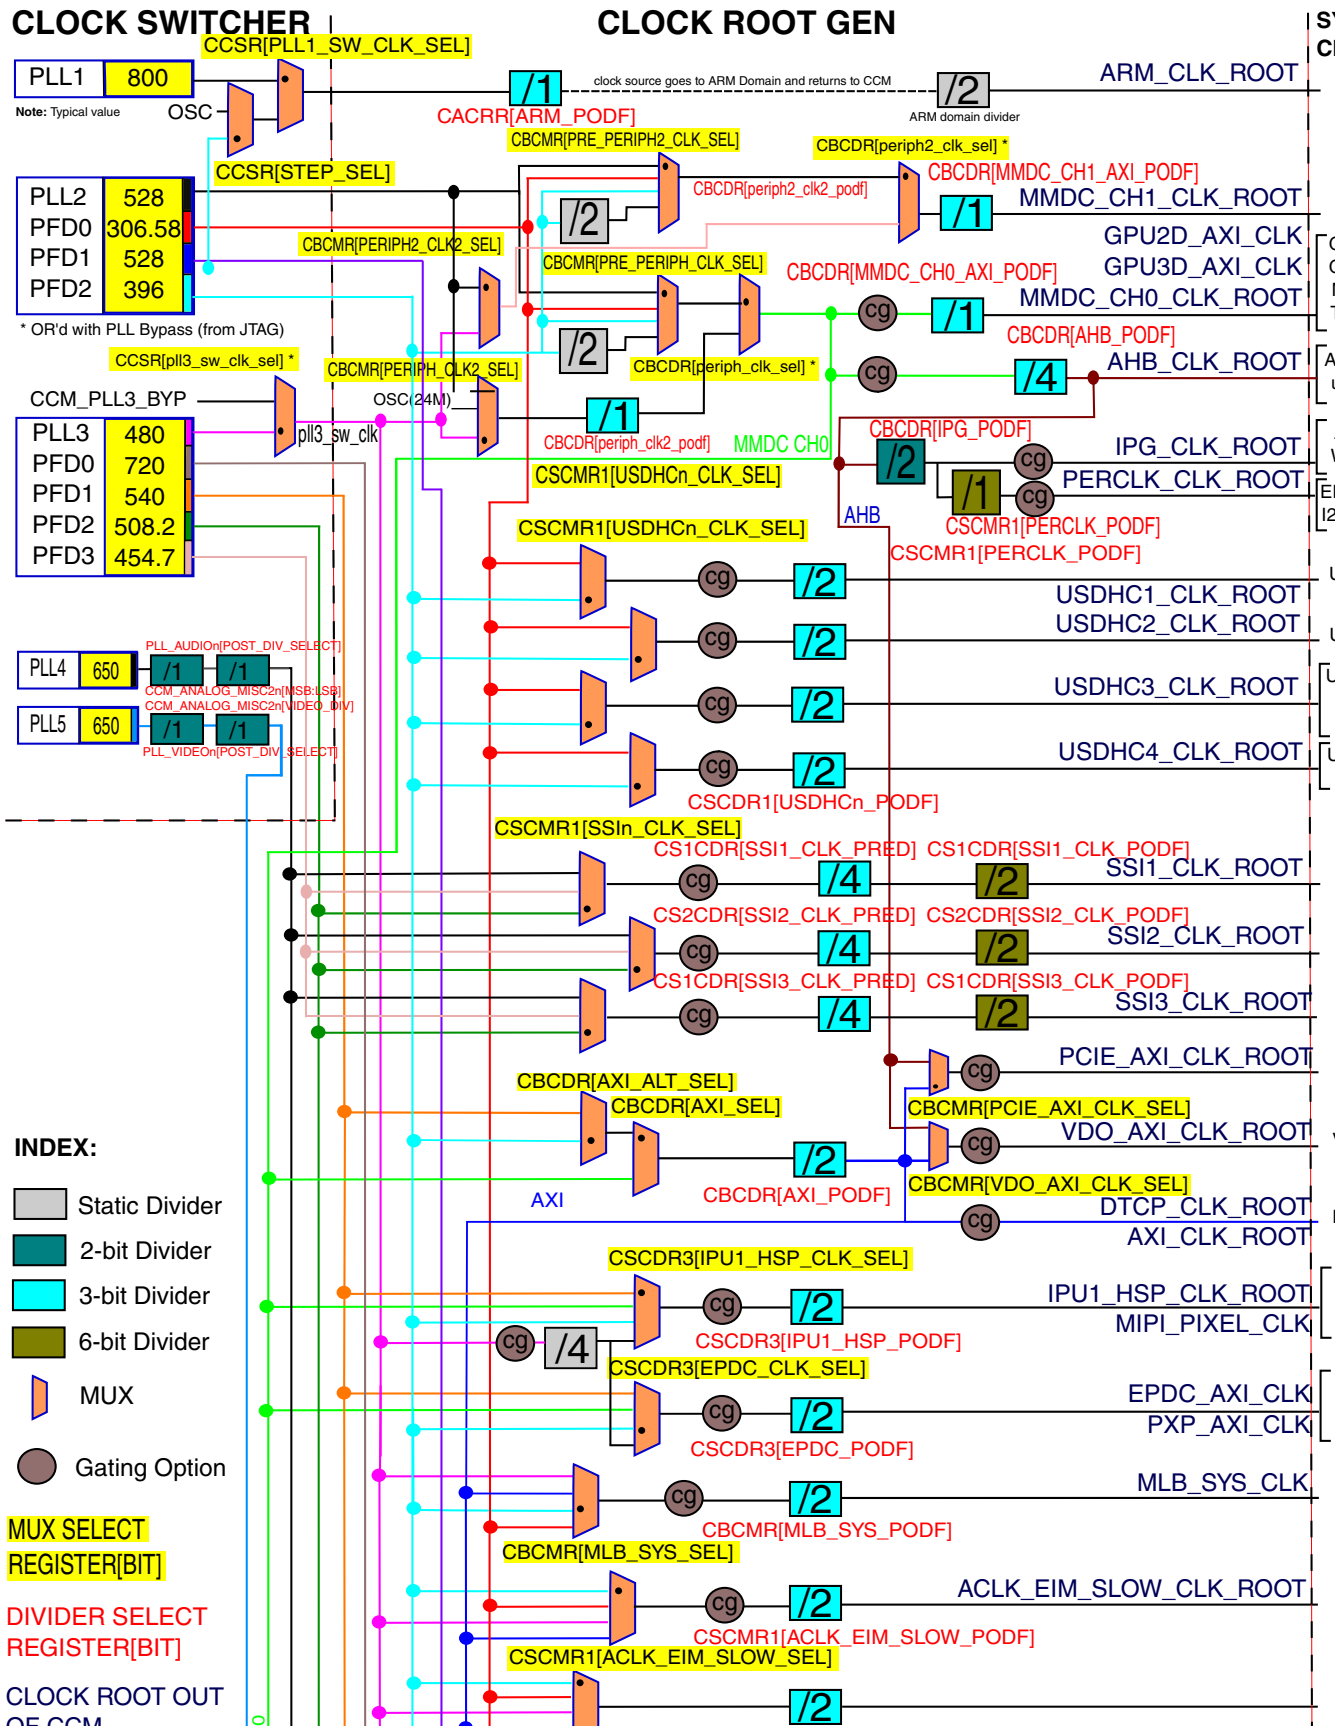
For detailed sub-block information, see:

- Clock Switcher
- Clock Root Generator

- Low Power Clock Gating module (LPCG)
- System Clocks

NOTE

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.



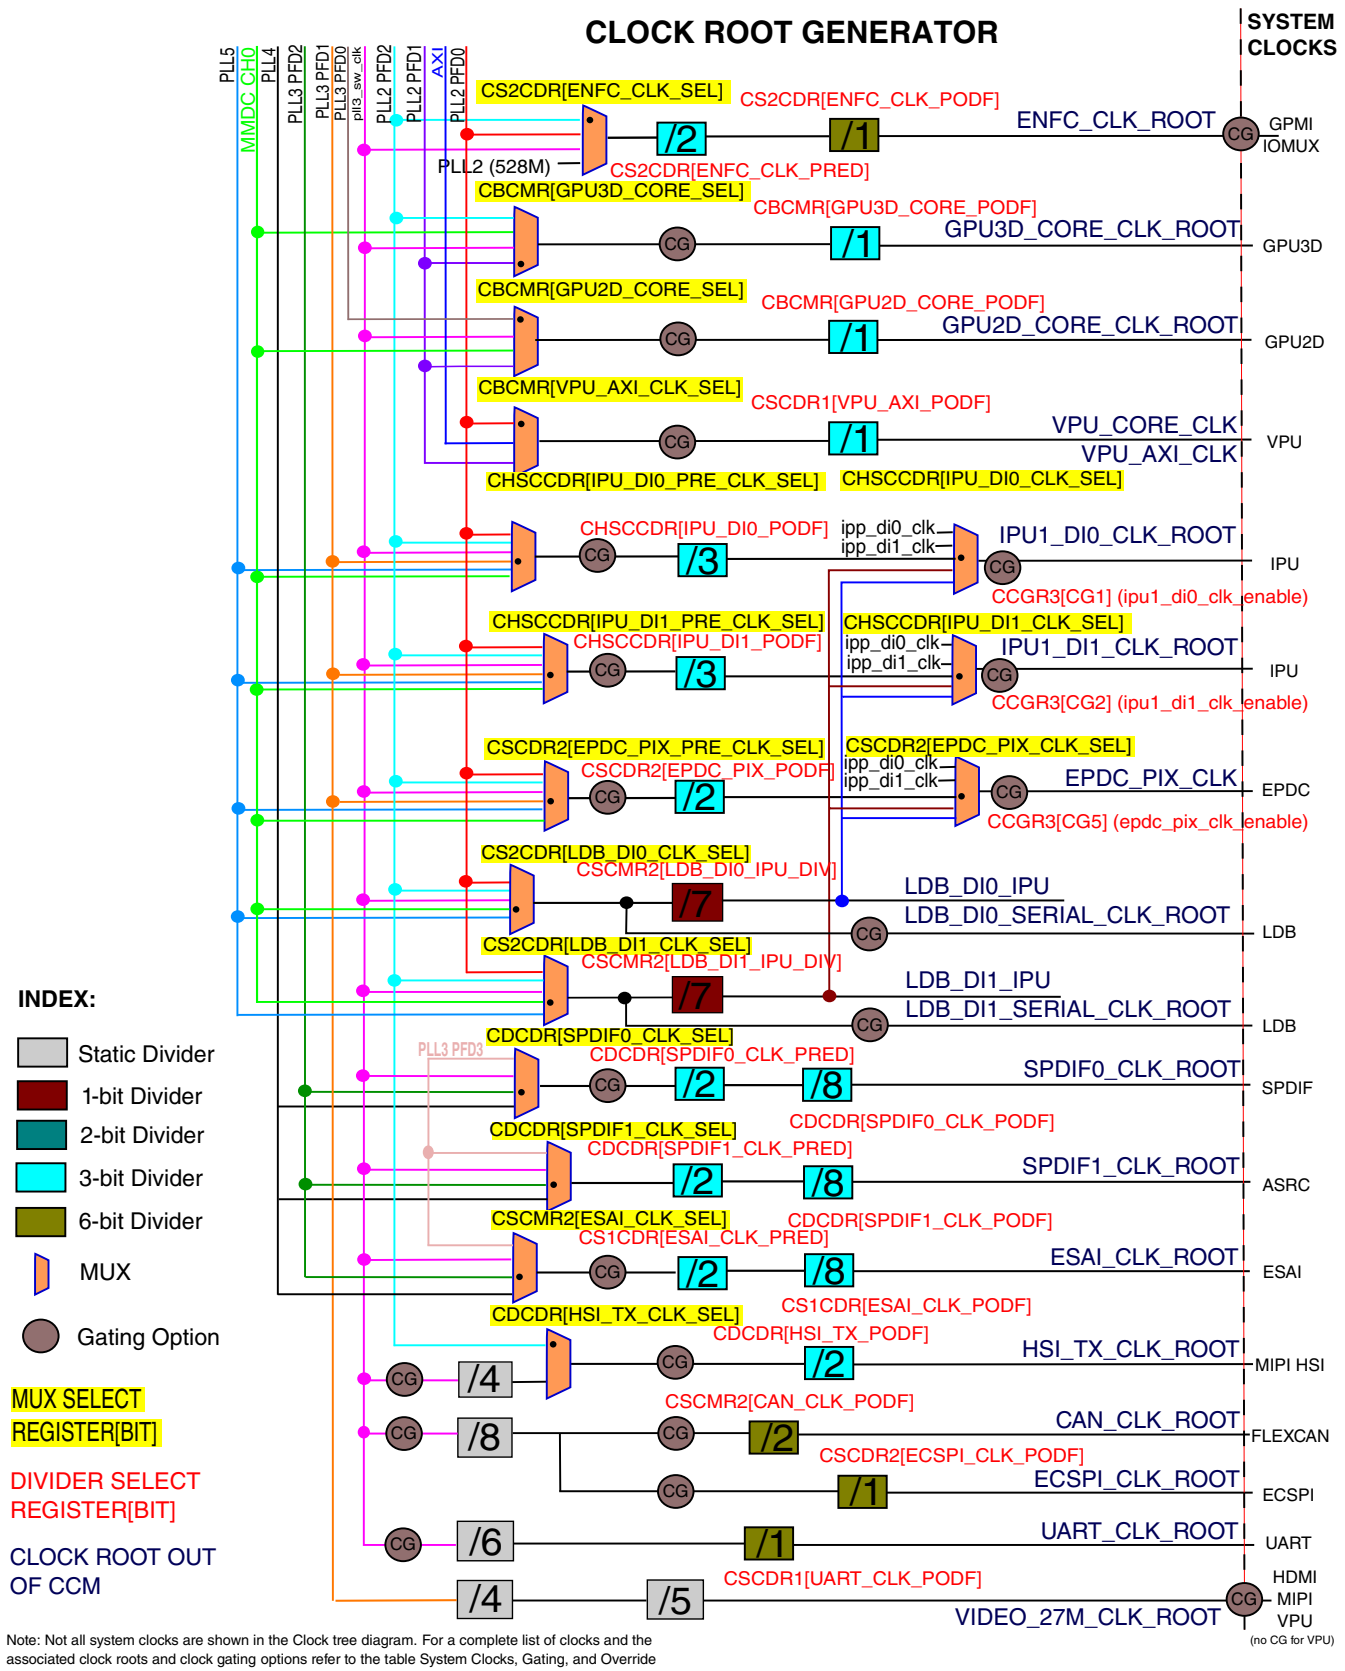


Figure 18-2. Clock Tree - Part 1

Note: Not all system clocks are shown in the Clock tree diagram. For a complete list of clocks and the associated clock roots and clock gating options refer to the table System Clocks, Gating, and Override

Figure 18-3. Clock Tree - Part 2

18.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

Table 18-3. System Clocks, Gating, and Override

Module	Module Clock	Clock Root	Module Clock Gating Enable[1]	Module Override Enable
AIPSTZ*n*	hclk	ahb_clk_root	CCGR0[CG0] (aips_tz1_clk_enable) CCGR0[CG1] (aips_tz2_clk_enable)

18.5 Functional Description

This section provides a complete functional description of the block.

18.5.1 Clock Generation

18.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG_CLK and supplied to modules that need it.

18.5.1.1.1 CKIL synchronizing to IPG_CLK

CKIL is synchronized to ipg_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

18.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

18.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency 800 MHz)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

PLL8 - MLB PLL

Some of the PLLs are described in the sections below. See CCM Analog Memory Map/ Register Definition for register information.

18.5.1.3.1 ARM PLL (PLL1)

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM_ANALOG_PLL_ARM[DIV_SELECT].

PLL output frequency = Fref * DIV_SEL/2

NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

18.5.1.3.2 System PLL (PLL2)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 3 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM_ANALOG_PLL_SYS_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STOP]}}{\text{CCM_ANALOG_PLL_SYS_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STEP]}}{2 \times \text{CCM_ANALOG_PLL_SYS_SS[STOP]}}$$

Although this PLL does have a DIV_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

This PLL also supports a Fractional-N synthesizer.

18.5.1.3.3 USB1 PLL (PLL3)

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV_SELECT register field, this PLL should always be set to 480 MHz in normal operation.

18.5.1.3.4 Audio PLL (PLL4)

The audio PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4 , /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_AUDIO, and CCM_ANALOG_MISC2 register sets according to the following equation.

PLL output frequency = Fref * (DIV_SELECT + NUM/DENOM)

18.5.1.3.5 Video PLL (PLL5)

The video PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_VIDEO, and CCM_ANALOG_MISC2 register sets according to the following equation.

PLL output frequency = Fref * (DIV_SELECT + NUM/DENOM)

18.5.1.3.6 MLB PLL

The MediaLB PLL is necessary in the MediaLB 6-Pin implementation to phase align the internal and external clock edges, effectively tuning out the delay of the differential clock receiver. The PLL is also responsible for generating the higher speed internal clock when the internal-to-external clock ratio is not 1:1.

18.5.1.3.7 Ethernet PLL (PLL6)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a 500 MHz clock. The reference clocks generated by this PLL are:

- Ref_PCIe =125 MHz
- Ref_ethernet, which is configurable based on the PLL_ENET[DIV_SELECT] register field.

18.5.1.3.8 USB2 PLL (PLL7)

USB2 PLL is only used by the USB UTM interface through a direct connection.

18.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to Fvco*18/N, N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See CCM Analog Memory Map/Register Definition.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL regrogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at www.nxp.com for procedure details.

18.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM_CLK_SWITCHER

CCM_CLK_ROOT_GEN

18.5.1.5.1 Clock Switcher

The Clock Switcher (CCM_CLK_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

Figure 18-4 describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

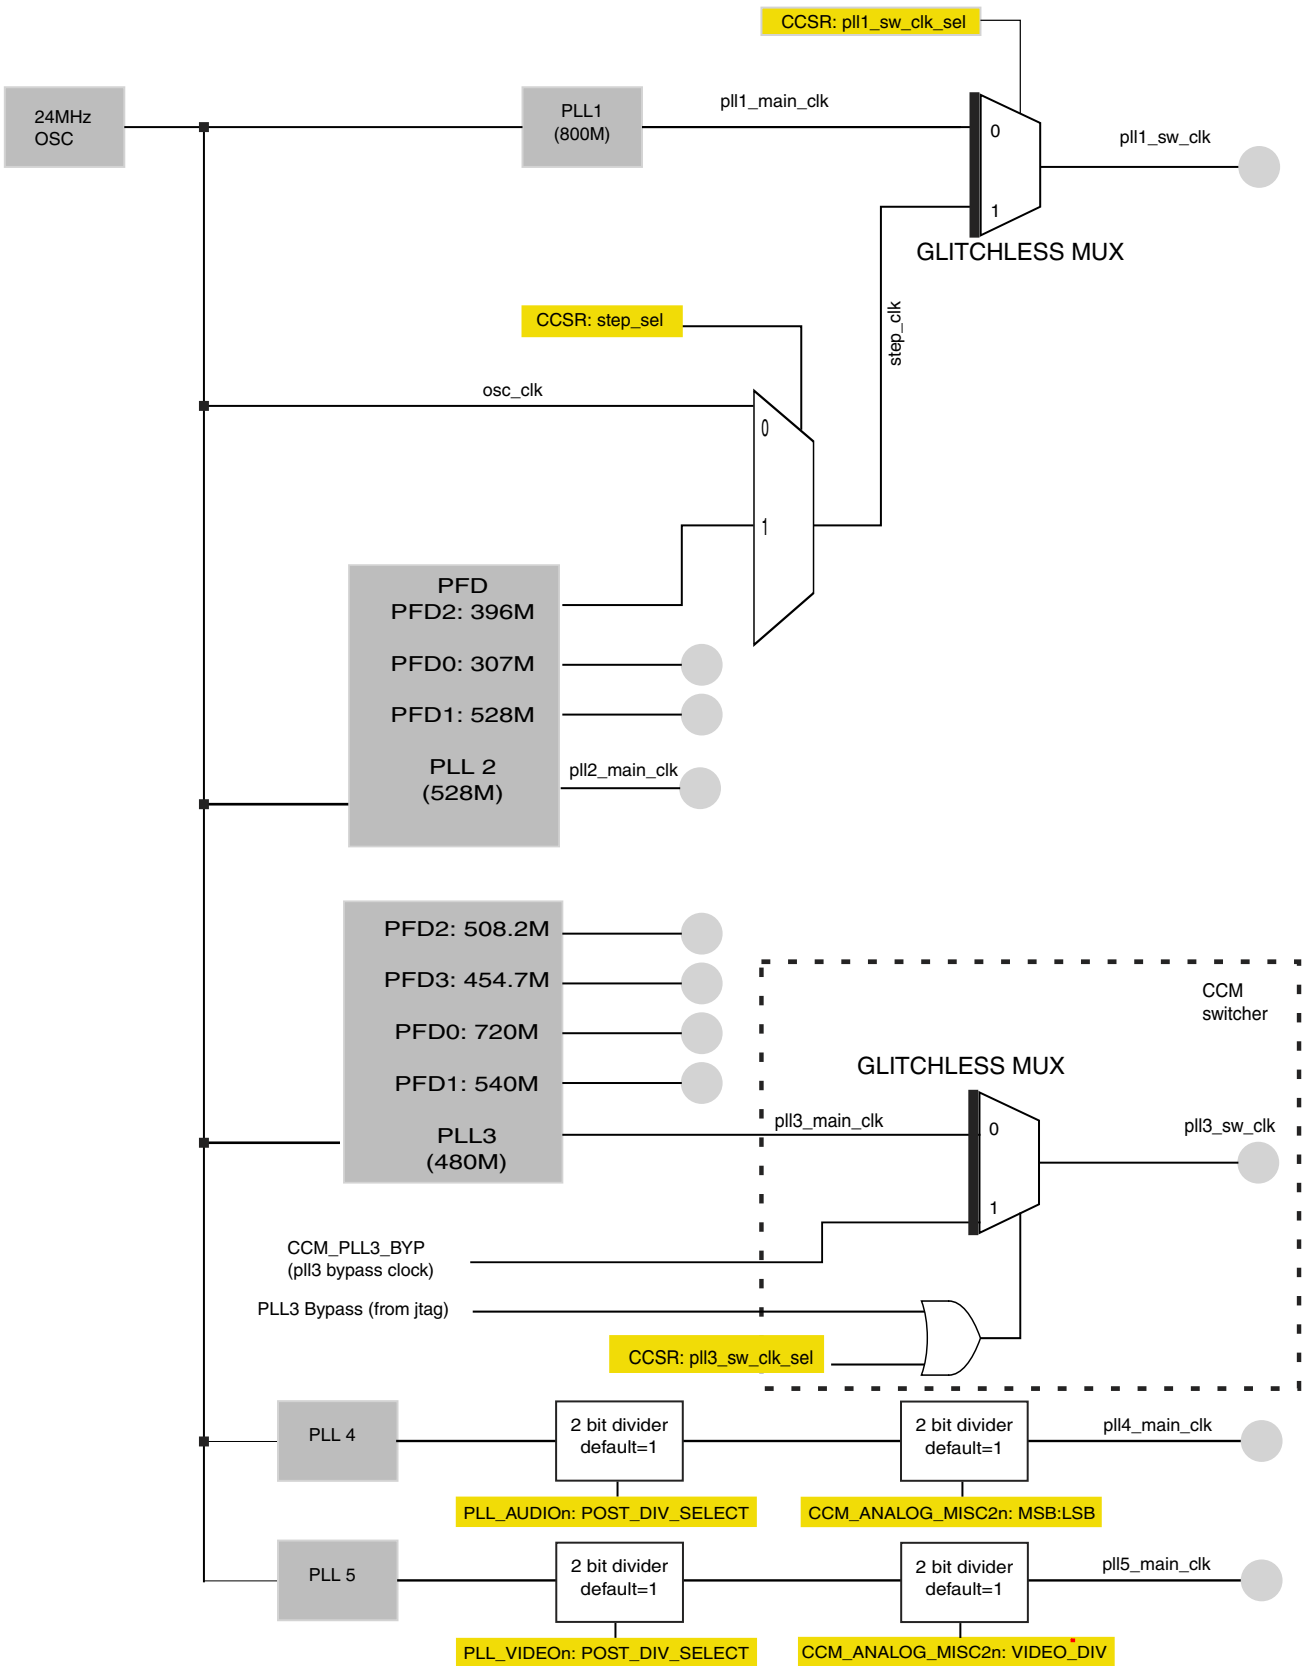

Figure 18-4. Switcher clock generation

18.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM_ANALOG module, switcher and clk_root_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

18.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See Disabling / Enabling PLLs for more information.

18.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM_CLK_ROOT_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC)

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init_mmdc_ch1_axi_podf
- [2:0] init_periph2_clk2_podf
- [1:0] init_ipg_podf
- [2:0] init_ahb_podf

- [2:0] init_axi_podf
- [2:0] init_mmdc_ch0_axi_podf
- [2:0] init_periph_clk2_podf
- init_periph_clk_sel
- init_periph2_clk_sel

18.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC CH1 and/or CH0.

- mmdc_ch0_axi_podf
- mmdc_ch1_axi_podf
- periph_clk_sel
- periph2_clk_sel
- arm_podf
- axi_podf
- ahb_podf

The dividers listed above are designed with a handshake. For dividers without a handshake design, the following sequence must be performed when updating PODF value:

1. Gate the output clock off before updating PODF value.
2. Gate the output clock on after the PODF value is updated and stable.

To update the PODF value without gating the output clock off will cause unpredictable results such as no clock output.

18.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

18.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM uses several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. For the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are several glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

Table 18-5. Glitchless Multiplexers

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

NOTE

Any change of the periph_clk_sel and periph2_clk_sel sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits.

Table 18-6. Multiplexers

Signal	Mux Select Bit	Glitchless
pll1_sw_clk	CCSR[pll1_sw_clk_sel]	Yes
step_clk	CCSR[step_sel]	No
pll3_sw_clk	CCSR[pll3_sw_clk_sel]	Yes
axi_alt	CBCDR[axi_alt_sel]	No

ACLK_CLK_ROOT	CSCMR1[aclk_sel]	No
ENFC_CLK_ROOT	CS2CDR[enfc_clk_sel]	No
HSI_TX_CLK_ROOT	CDCDR[hsi_tx_clk_sel]	No

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in Figure 18-5. In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the FABRIC_CLK_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH2_CLK2_SEL] and CBCDR[PERIPH2_CLK2_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH2_CLK_SEL].

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The output clocks to the mux are required to be gated before switching the source clock in the CCM clock mux. If the output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

18.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

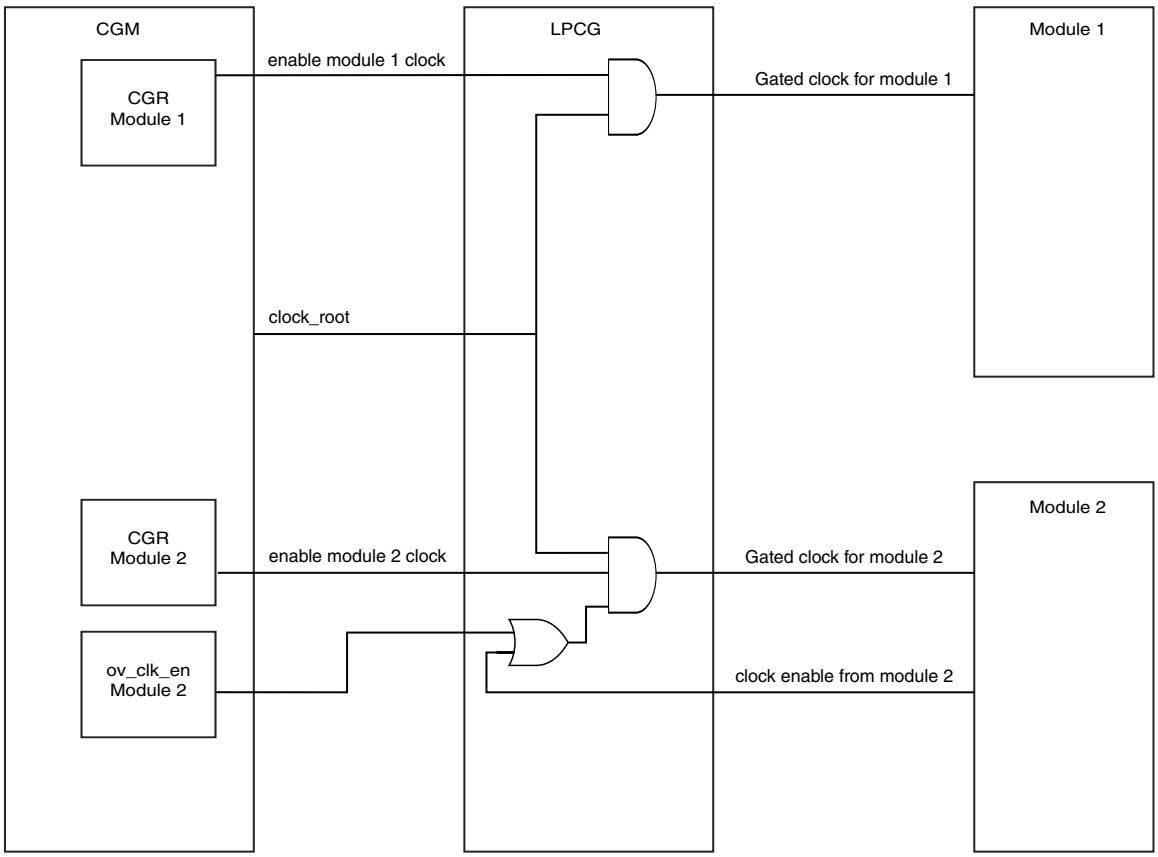

Figure 18-10. Clock split in LPCG

18.5.1.9 MMDC handshake

CCM will assert the mmdc_freq_change_req signal.

MMDC will assert the mmdc0_freq_change_ack and mmdc1_freq_change_ack signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of mmdc0 and/or mmdc1 dividers or apply mux change on root clocks after both of the non-masked acknowledges are asserted.

NOTE

MMDC handshakes can be masked.

18.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the Arm core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM_ANALOG module.

NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

NOTE

CCM_ANALOG will not control the voltage value in Bypass mode

18.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

18.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

18.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all Arm cores are in WFI, and L2 cache and SCU are idle.

18.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programing the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. After CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

18.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

18.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for Arm platform, GPU3D, and VPU. External supply voltage can be reduced to decrease leakage.

18.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM_PMIC_STBY_REQ asserted, if vstby bit is set
- osc_en signal is negated
- osc_pwrdn is asserted, if sbyos bit is set

Counter will be triggered after CCM_PMIC_STBY_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP_GPC until STOP mode is exited.

18.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC_STBY_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If well bias was enabled, deasserted well bias controls.
3. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref_en_b signal and deasserting cosc_pwrdown signal respectively.
4. After the number of cycles of CKILs defined in stby_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
5. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
6. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
7. CCM will request GPC to restore Arm power by GPC_PUP_REQ. If power was removed from the Arm platform, GPC will notify CCM by asserting signal GPC_PUP_ACK that power to Arm is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
8. After assertion of notification from src that the resets for the power gated modules has been finished, (src_power_gating_reset_done is set) negate the low power request signals to all modules and enable all module clocks including Arm clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

After the system is in run mode, the ccm_ipg_stop and system_in_stop_mode signals negate.

18.6 CCM Memory Map/Register Definition

NOTE

The register reset values for CCM change depending on the boot configuration. See Clocks at boot time for more information.

CCM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

18.6.1 CCM Control Register (CCM_CCR)

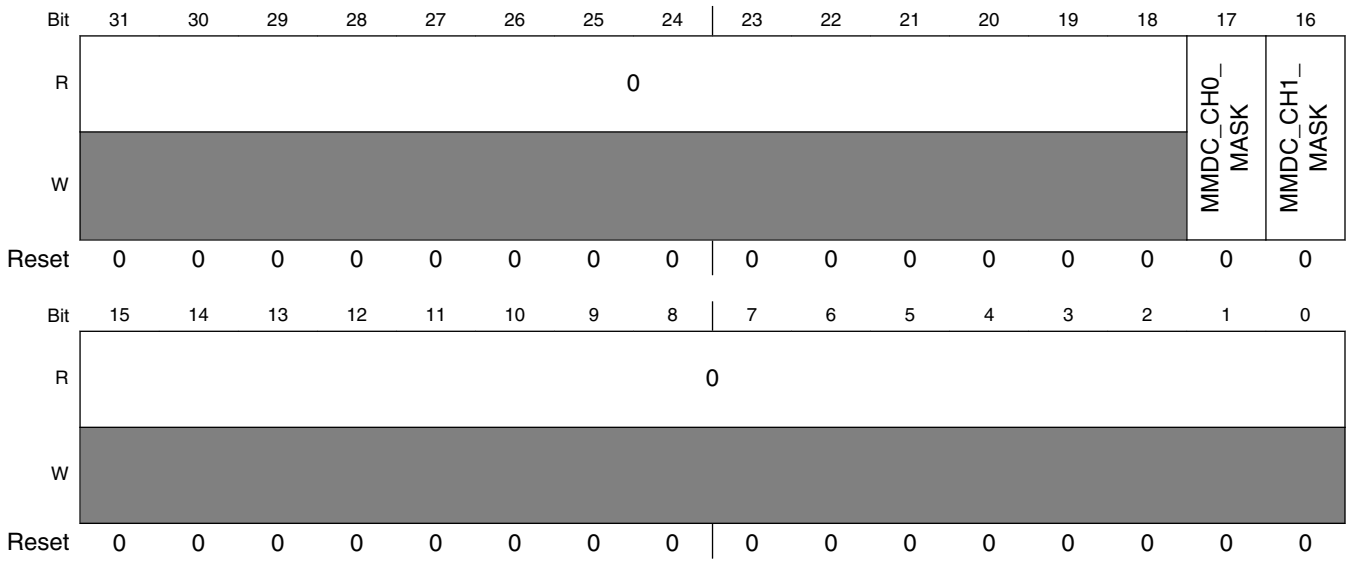
The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C_4000h base + 0h offset = 20C_4000h

CCM_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled. 1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_ COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode. REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core. 000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 WB_COUNT	Well Bias counter. Delay, defined by this value, counted by CKIL clock will be applied till well bias is enabled at exit from wait or stop low power mode. Counter will be used if wb_core_at_lpm or wb_per_at_lpm bits are set. Should be zeroed and reconfigured after exit from low power mode. 000 no delay

Table continues on the next page...



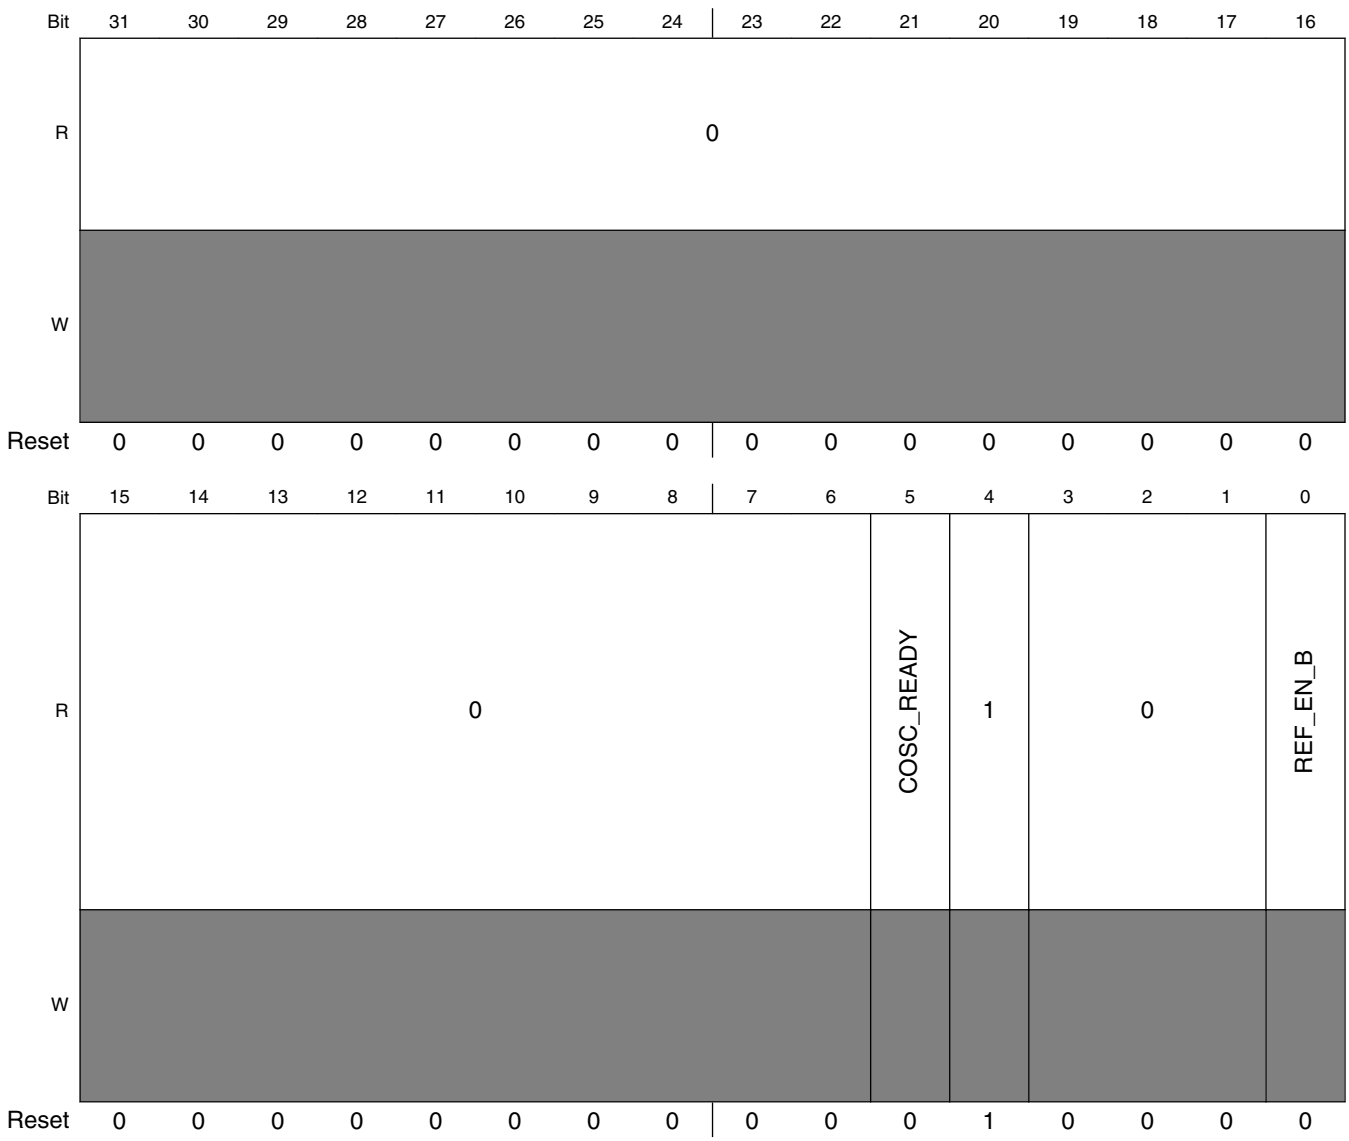
CCM_CCR field descriptions (continued)

Field	Description
	001 1 CKIL clock delay 111 7 CKIL clocks delay
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by an interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator
11–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened. 00000000 count 1 ckil 11111111 count 256 ckil's

18.6.2 CCM Control Divider Register (CCM_CCDR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C_4000h base + 4h offset = 20C_4004h



CCM_CCDR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 MMDC_CH0_MASK	During divider ratio mmdc_ch0_axi_podf change or sync mux periph_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch0 module. This field value should be set to 1 for normal operation. 0 allow handshake with mmdc_ch0 module 1 mask handshake with mmdc_ch0. Request signal will not be generated.
16 MMDC_CH1_MASK	During divider ratio mmdc_ch1_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch1 module. 0 Allow handshake with mmdc_ch1 module. 1 Mask handshake with mmdc_ch1. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

18.6.3 CCM Status Register (CCM_CSR)

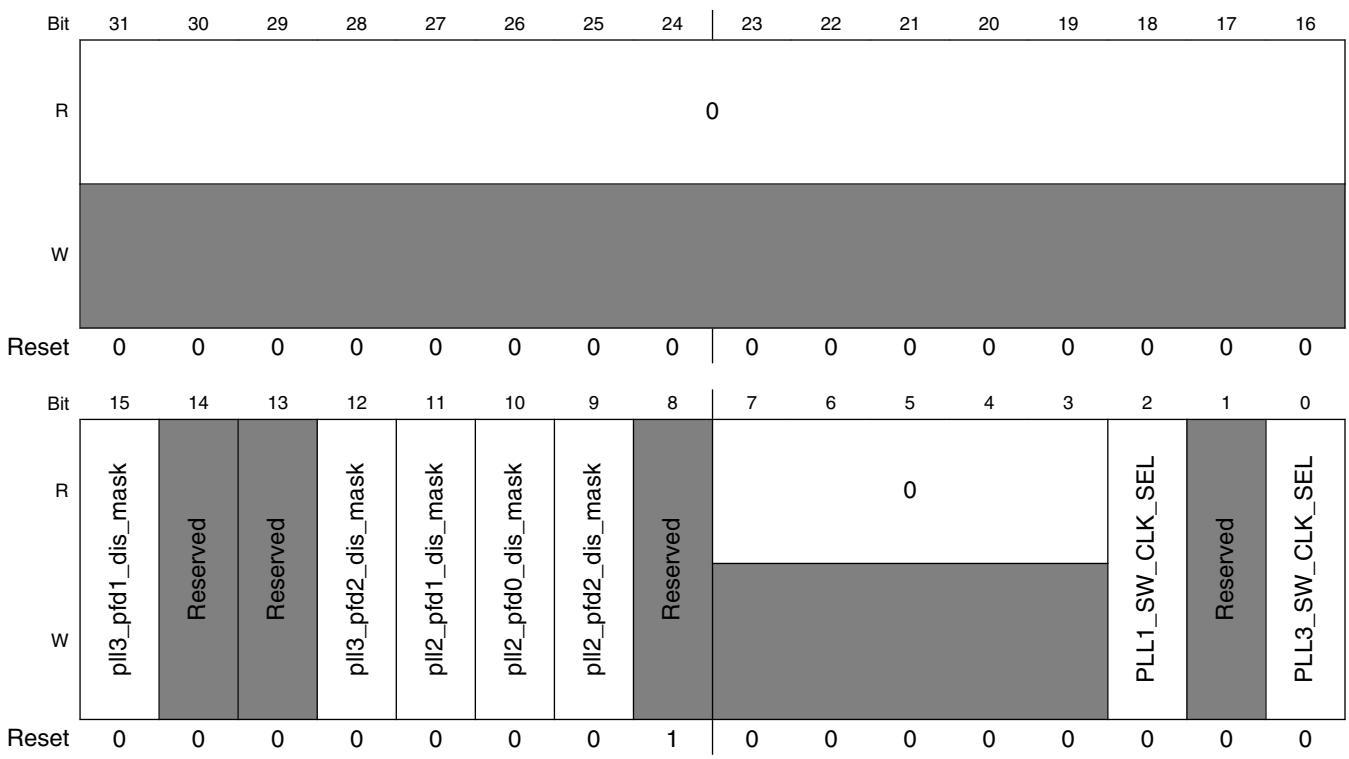
The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C_4000h base + 8h offset = 20C_4008h

CCM_CSR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...



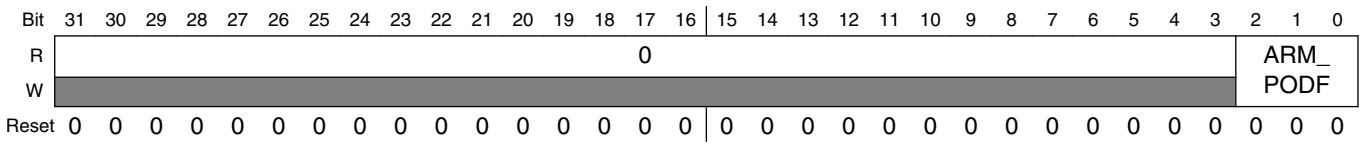
CCM_CSR field descriptions (continued)

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting. 0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

18.6.4 CCM Clock Switcher Register (CCM_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C_4000h base + Ch offset = 20C_400Ch



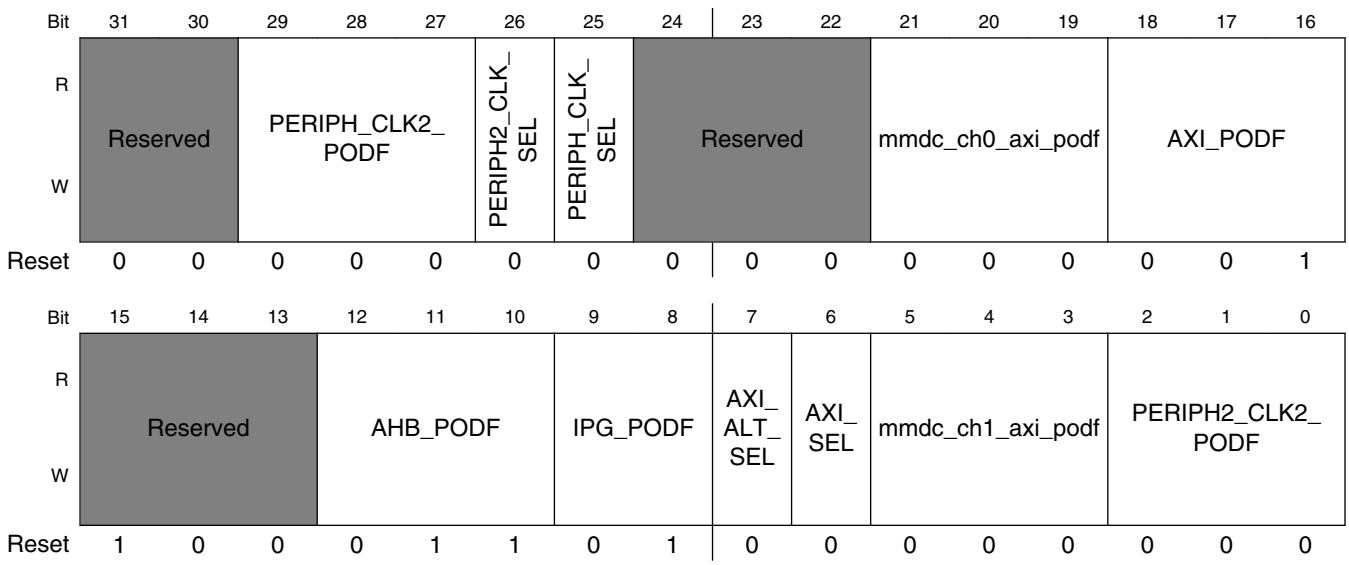
CCM_CCSR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 pll3_pfd1_dis_mask	Mask of PLL3 PFD1 auto-disable. 0 - PLL3 PFD1 disable=0 (PFD always on) 1 PLL3 PFD1 disable is managed by associated dividers disable. If all PLL3 PFD1-driven dividers are closed, PFD is disabled.
14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 pll3_pfd2_dis_mask	Mask of PLL3 PFD2 auto-disable. 0 PLL3 PFD2 disable=0 (PFD always on) 1 PLL3 PFD2 disable is managed by associated dividers disable. If all PLL3 PFD2-driven dividers are closed, PFD is disabled.
11 pll2_pfd1_dis_mask	Mask of PLL2 PFD1 auto-disable. 0 PLL2 PFD1 disable=0 (PFD always on) 1 PLL2 PFD1 disable is managed by associated dividers disable. If all PLL2 PFD1-driven dividers are closed, PFD is disabled.
10 pll2_pfd0_dis_mask	Mask of PLL2 PFD0 auto-disable. 0 PLL2 PFD0 disable=0 (PFD always on) 1 PLL2 PFD0 disable is managed by associated dividers disable. If all PLL2 PFD0-driven dividers are closed, PFD is disabled.
9 pll2_pfd2_dis_mask	Mask of PLL2 PFD2 auto-disable. 0 PLL2 PFD2 disable=0 (PFD always on) 1 PLL2 PFD2 disable is managed by associated dividers disable. If all PLL2 PFD2-driven dividers are closed, PFD is disabled.
8 -	This field is reserved. Reserved
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 PLL1_SW_CLK_SEL	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

18.6.5 CCM Arm Clock Root Register (CCM_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the Arm clock root generation. The table below provides its field descriptions.

Address: 20C_4000h base + 10h offset = 20C_4010h



CCM_CACRR field descriptions

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
ARM_PODF	Divider for Arm clock root. **NOTE:** If arm_freq_shift_divider is set to '1' then any new write to arm_podf will be held until arm_clk_switch_req signal is asserted. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

18.6.6 CCM Bus Clock Divider Register (CCM_CBCDR)

The figure below represents the CCM Bus Clock Divider Register (CBCDR). The CBCDR register contains bits to control the clock generation sub module dividers. The table below provides its field descriptions.

Address: 20C_4000h base + 14h offset = 20C_4014h

CCM_CBCDR field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29–27 PERIPH_CLK2_ PODF	Divider for periph_clk2_podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
26 PERIPH2_CLK_ SEL	Selector for peripheral2 main clock (source of mmdc_ch1_clk_root). **NOTE:** Any change of this mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits.

Table continues on the next page...

CCM_CBCDR field descriptions (continued)

Field	Description
	0 PLL2 (pll2_main_clk) 1 derive clock from periph2_clk2_clk clock source.
25 PERIPH_CLK_SEL	Selector for peripheral main clock. **NOTE:** Alternative clock source should be used when PLL is relocked. For PLL relock procedure pls refer to the PLL chapter. **NOTE:** Any change of this sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph_clk2_clk clock source.
24–22 -	This field is reserved. Reserved
21–19 mmdc_ch0_axi_podf	Divider for mmdc_ch0_axi podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
18–16 AXI_PODF	Divider for axi podf. **NOTE:** Any change of this divider might involve handshake with EMIand IPU. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
15–13 -	This field is reserved. Reserved
12–10 AHB_PODF	Divider for AHB PODF. **NOTE:** Any change of this divider might involve handshake with EMIand IPU. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6

Table continues on the next page...

CCM_CBCDR field descriptions (continued)

Field	Description
	110 divide by 7 111 divide by 8
9–8 IPG_PODF	Divider for ipg podf. **NOTE:** SDMA module will not support ratio of 1:3 and 1:4 for ahb_clk:ipg_clk. In case SDMA is used, then those ratios should not be used. 00 divide by 1 01 divide by 2 10 divide by 3 11 divide by 4
7 AXI_ALT_SEL	AXI alternative clock select 0 PLL2 PFD2 will be selected as alternative clock for AXI root clock 1 PLL3 PFD1 will be selected as alternative clock for AXI root clock
6 AXI_SEL	AXI clock source select 0 Periph_clk output will be used as AXI clock root 1 AXI alternative clock will be used as AXI clock root
5–3 mmdc_ch1_axi_podf	Divider for mmdc_ch1_axi podf. **NOTE:** This design implementation does not use MMDC_CH1_CLK_ROOT as a clock source to the MMDC. Only MMDC_CH0_CLK_ROOT is used. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
PERIPH2_CLK2_PODF	Divider for periph2_clk2 podf. **NOTE:** Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

18.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm_clk_sel should be done through sdma so that Arm will not use this clock during the change and the clock will be gated in LPCG.

18.6.10 CCM Serial Clock Divider Register 1 (CCM_CSCDR1)

The figure below represents the CCM Serial Clock Divider Register 1 (CSCDR1). The CSCDR1 register contains bits to control the clock generation sub-module dividers. The table below provides its field descriptions.

NOTE

Any change on the above dividers will have to be done while the module that its clock is affected is not functional and the affected clock is gated. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

Address: 20C_4000h base + 24h offset = 20C_4024h

CCM_CSCDR1 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–25 VPU_AXI_PODF	Divider for vpu axi clock podf. **NOTE:** Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
24–22 USDHC4_PODF	Divider for usdhc4 clock pred. **NOTE:** Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
21–19 USDHC3_PODF	Divider for usdhc3 clock podf. **NOTE:** Divider should be updated when output clock is gated. 000 divide by 1

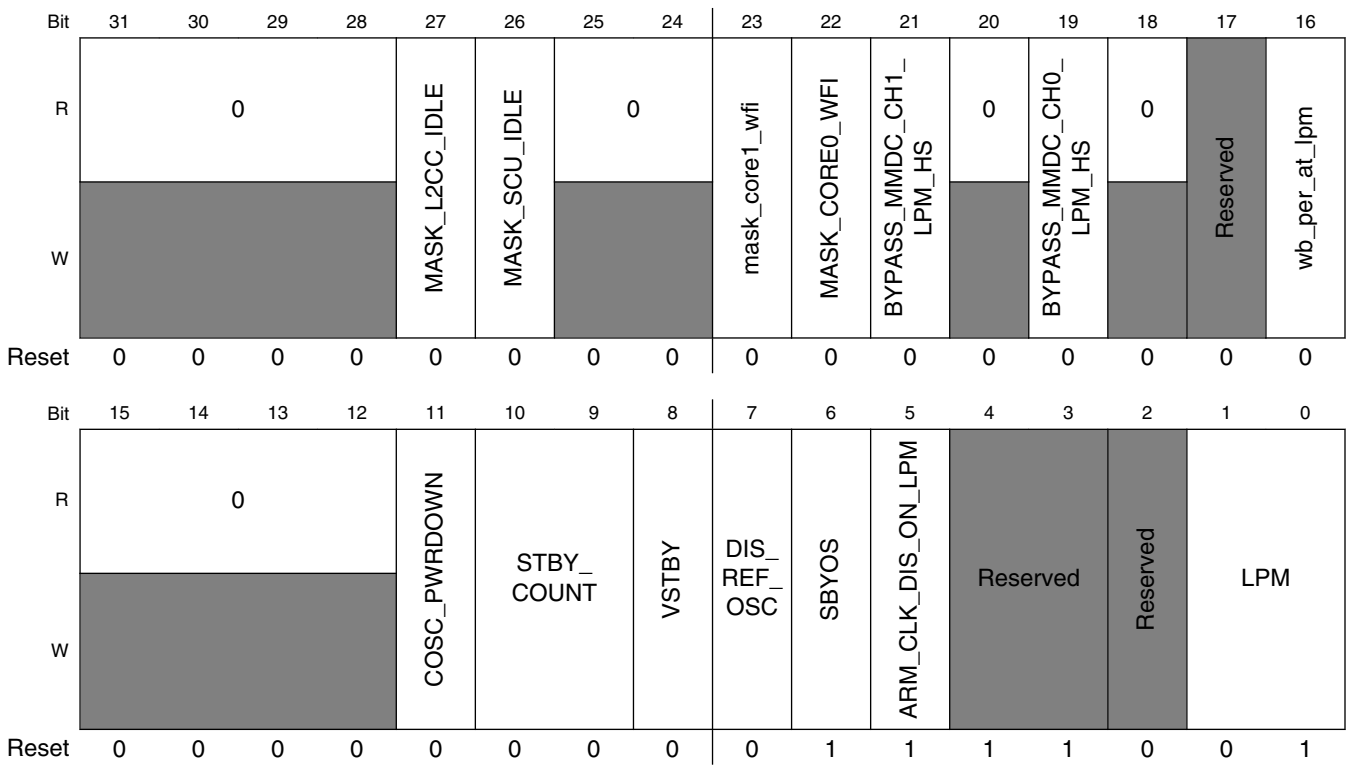
CCM_CDHIPR field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 ARM_PODF_ BUSY	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 PERIPH_CLK_ SEL_BUSY	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 mmdc_ch0_ podf_busy	Busy indicator for mmdc_ch0_axi_podf.

Table continues on the next page...



CCM_CDHIPR field descriptions (continued)

Field	Description
	0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_ch0_axi_podf will be applied.
3 PERIPH2_CLK_SEL_BUSY	Busy indicator for periph2_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.
2 mmdc_ch1_podf_busy	Busy indicator for mmdc_ch1_axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_ch1_axi_podf will be applied.
1 AHB_PODF_BUSY	Busy indicator for ahb_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.
0 AXI_PODF_BUSY	Busy indicator for axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the axi_podf will be applied.

18.6.18 CCM Low Power Control Register (CCM_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation.The table below provides its field descriptions.

Address: 20C_4000h base + 54h offset = 20C_4054h

CCM_CLPCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. **NOTE:** Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode **NOTE:** Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description

23 mask_core1_wfi	Mask WFI of core1 for entering low power mode **NOTE:** Assertion of all bits[27:22] will generate low power mode request 1 WFI of core1 is masked 0 WFI of core1 is not masked
22 MASK_CORE0_WFI	Mask WFI of core0 for entering low power mode **NOTE:** Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_MMDC_CH1_LPM_HS	Bypass handshake with mmdc_ch1 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. 0 Handshake with mmdc_ch1 on next entrance to low power mode will be performed. 1 Handshake with mmdc_ch1 on next entrance to low power mode will be bypassed.
20 Reserved	This read-only field is reserved and always has the value 0.
19 BYPASS_MMDC_CH0_LPM_HS	Bypass handshake with mmdc_ch0 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake will also be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch0 clock. **NOTE:** MMDC_CH0 clock is not used. This bit should always be programmed HIGH to let CCM know not to wait for the acknowledge from MMDC_CH0, due to no connection. 0 Handshake with mmdc_ch0 on next entrance to low power mode will be performed. 1 Handshake with mmdc_ch0 on next entrance to low power mode will be bypassed.
18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. Reserved
16 wb_per_at_lpm	Enable periphery charge pump for well biasing at low power mode (stop or wait) 0 Periphery charge pump won't be enabled at STOP or WAIT low power modes 1 Periphery charge pump will be enabled at STOP or WAIT low power modes
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 COSC_PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscilator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

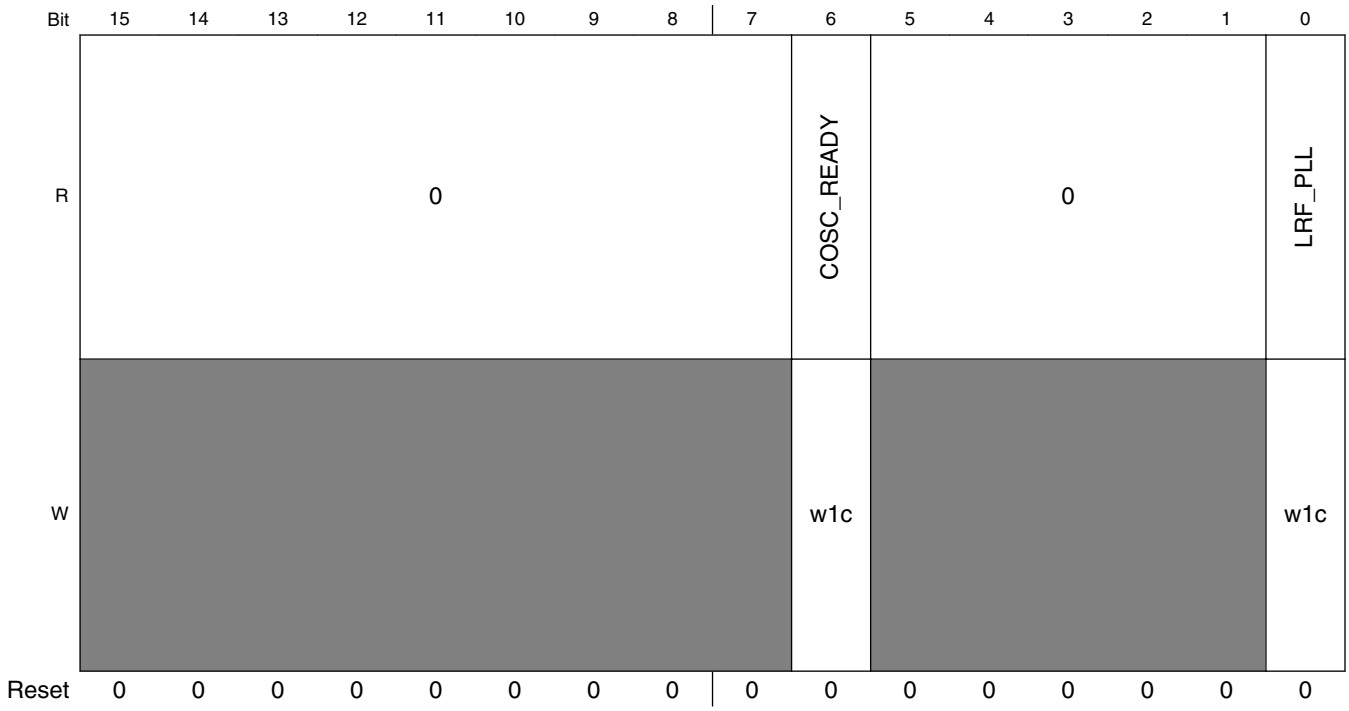
Field	Description
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). **NOTE:** Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will be asserted - '1').
7 DIS_REF_OSC	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed. The manual closing of external reference oscilator should be performed only in case the reference oscilator is not the source of any clock generation. **NOTE:** When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits. 0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'
6 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator. 0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.
5 ARM_CLK_DIS_ON_LPM	Define if Arm clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep Arm clock functioning. **NOTE:** Software should not enable Arm power gating in wait mode if this bit is cleared. 0 Arm clock enabled on wait mode. 1 Arm clock disabled on wait mode. .
4–3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of dsm_request signal.

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
	NOTE: Set CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits to 1 when setting CCM_CLPCR[LPM] bits to 01 (WAIT Mode) or 10 (STOP mode) without power gating. CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits do not have to be set for STOP mode entry. 00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved

18.6.19 CCM Interrupt Status Register (CCM_CISR)



The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. After an interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

Address: 20C_4000h base + 58h offset = 20C_4058h

18.6.22 CCM General Purpose Register (CCM_CGPR)

Fast PLL enable. Can be used to engage PLL faster after STOP mode, if 24MHz OSC was active

Address: 20C_4000h base + 64h offset = 20C_4064h

CCM_CGPR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the Arm Platform memories with additional control logic based on the Arm WFI signal. Used to keep the Arm Platform memory clocks enabled if an interrupt is pending when entering low power mode. **NOTE:** This bit should always bet set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry. 0 Disable the clock to the Arm platform memories when entering Low Power Mode 1 Keep the clocks to the Arm platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable.

Table continues on the next page...

CCM_CGPR field descriptions (continued)

Field	Description
	0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing 0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing.
3 -	This field is reserved. Reserved
2 MMDC_EXT_CLK_DIS	Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	Defines clock dividion of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

18.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C_4000h base + 68h offset = 20C_4068h

18.6.27 CCM Clock Gating Register 4 (CCM_CCGR4)

The figure below represents the CCM Clock Gating Register 4 (CCM_CCGR4). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 8 CGR registers. The number of registers required is determined by the number of peripherals in the system.

Address: 20C_4000h base + 78h offset = 20C_4078h

CCM_CMEOR field descriptions (continued)

Field	Description
30 mod_en_ov_ can1_cpi	Overide clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't overide module enable signal 1 overide module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 mod_en_ov_ can2_cpi	Overide clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27–12 Reserved	This read-only field is reserved and always has the value 1.
11 mod_en_ov_ gpu3d	Overide clock enable signal from GPU3D - clock will not be gated based on GPU3D's signal. 0 don't override module enable signal 1 override module enable signal
10 mod_en_ov_ gpu2d	Overide clock enable signal from GPU2D - clock will not be gated based on GPU's signal 'gpu2d_busy' . 0 don't override module enable signal 1 override module enable signal
9 mod_en_ov_vpu	Overide clock enable signal from VPU- clock will not be gated based on VPU's signal 'vpu_idle' . 0 don't override module enable signal 1 override module enable signal
8 mod_en_ov_dap	Overide clock enable signal from DAP- clock will not be gated based on DAP's signal 'dap_dbgen' . 0 don't override module enable signal 1 override module enable signal
7 mod_en_usdhc	Overide clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 mod_en_ov_epit	Overide clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 mod_en_ov_gpt	Overide clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
4 mod_en_ov_ vdoa	Overide clock enable signal from vdoa - clock will not be gated based on vdoa signal. 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

18.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within {}. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

18.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM*n*)

The control register provides control for the system PLL.

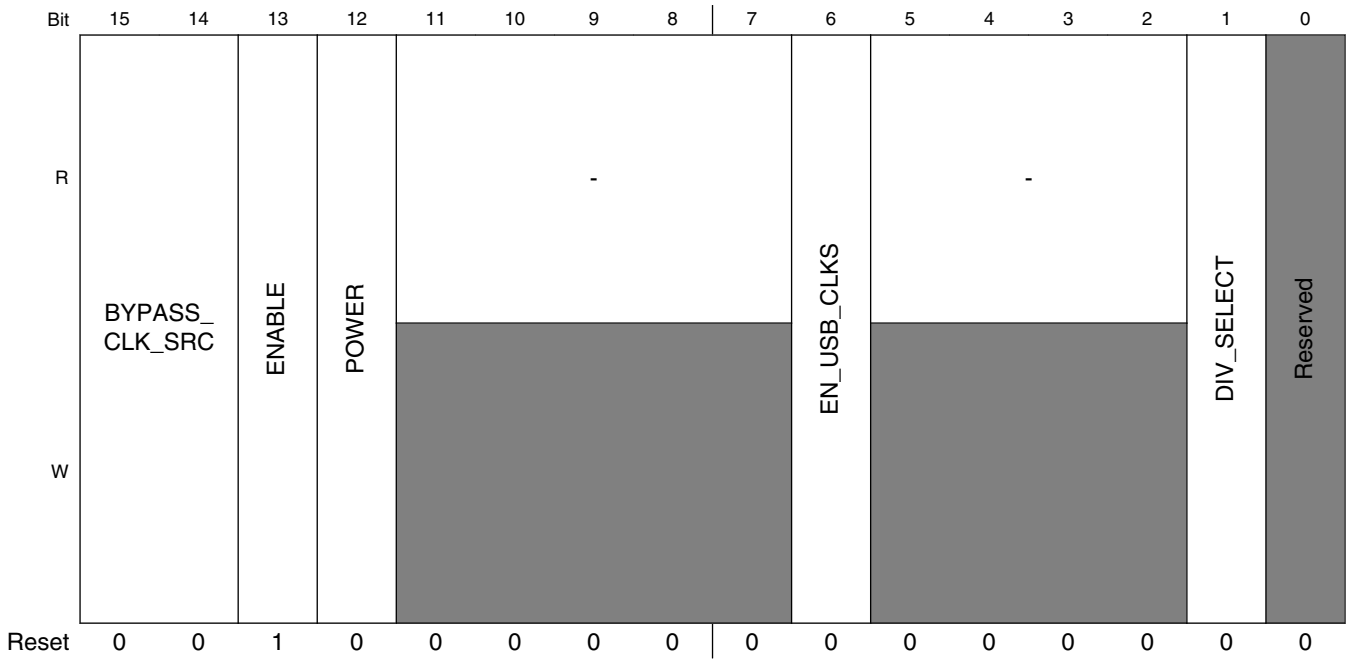
Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ARM*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.

Table continues on the next page...

CCM_ANALOG_PLL_ARM*n* field descriptions (continued)



Field	Description
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved
18 LVDS_24MHZ_SEL	Analog Debug Bit
17 LVDS_SEL	Analog Debug Bit
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. **NOTE:** Changing the Bypass clock source also changes the PLL reference clock source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **CLK2** — Select the CLK2_N / CLK2_P as source. 0x3 **XOR** — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. Fout = Fin * div_select/2.0.

18.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1*n*)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C_8000h base + 10h offset + (4d × i), where i=0d to 3d

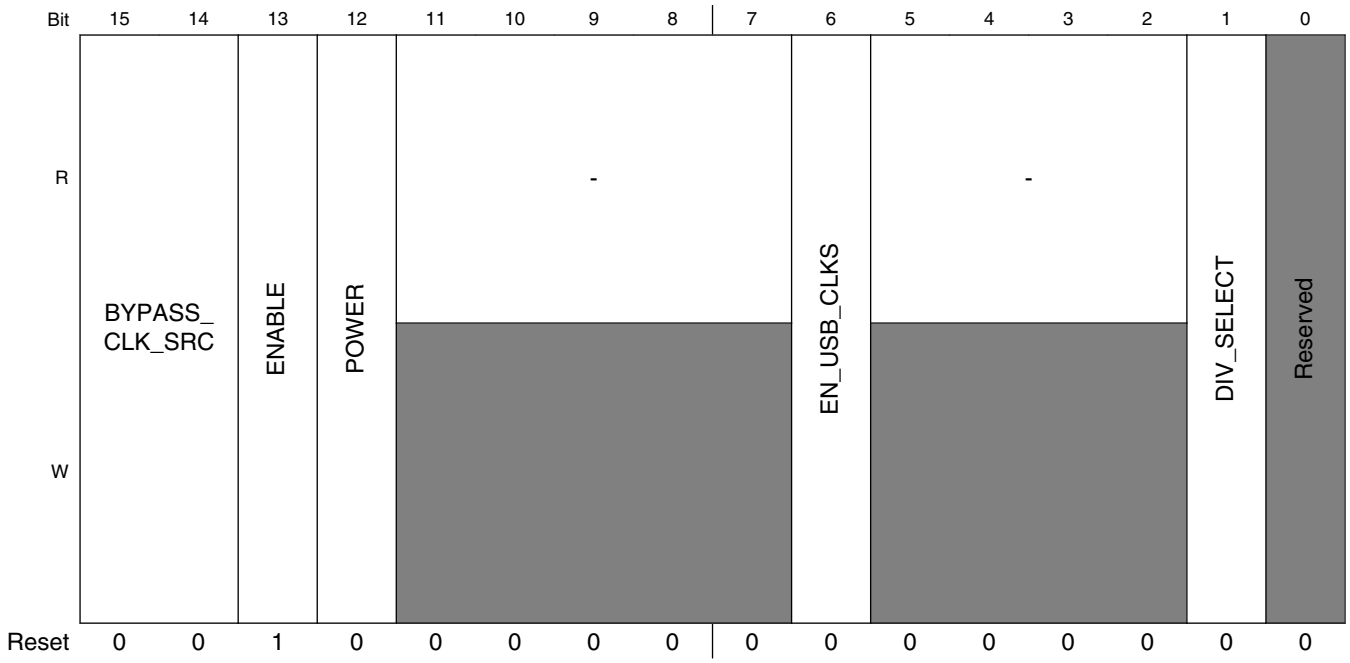
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK	-														BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

CCM_ANALOG_PLL_USB1*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **CLK2** — Select the CLK2_N / CLK2_P as source. 0x3 **XOR** — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs. 0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).

Table continues on the next page...

CCM_ANALOG_PLL_USB1*n* field descriptions (continued)



Field	Description
1 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.
0 -	This field is reserved. Reserved.

18.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2*n*)

The control register provides control for USBPHY1 480MHz PLL.

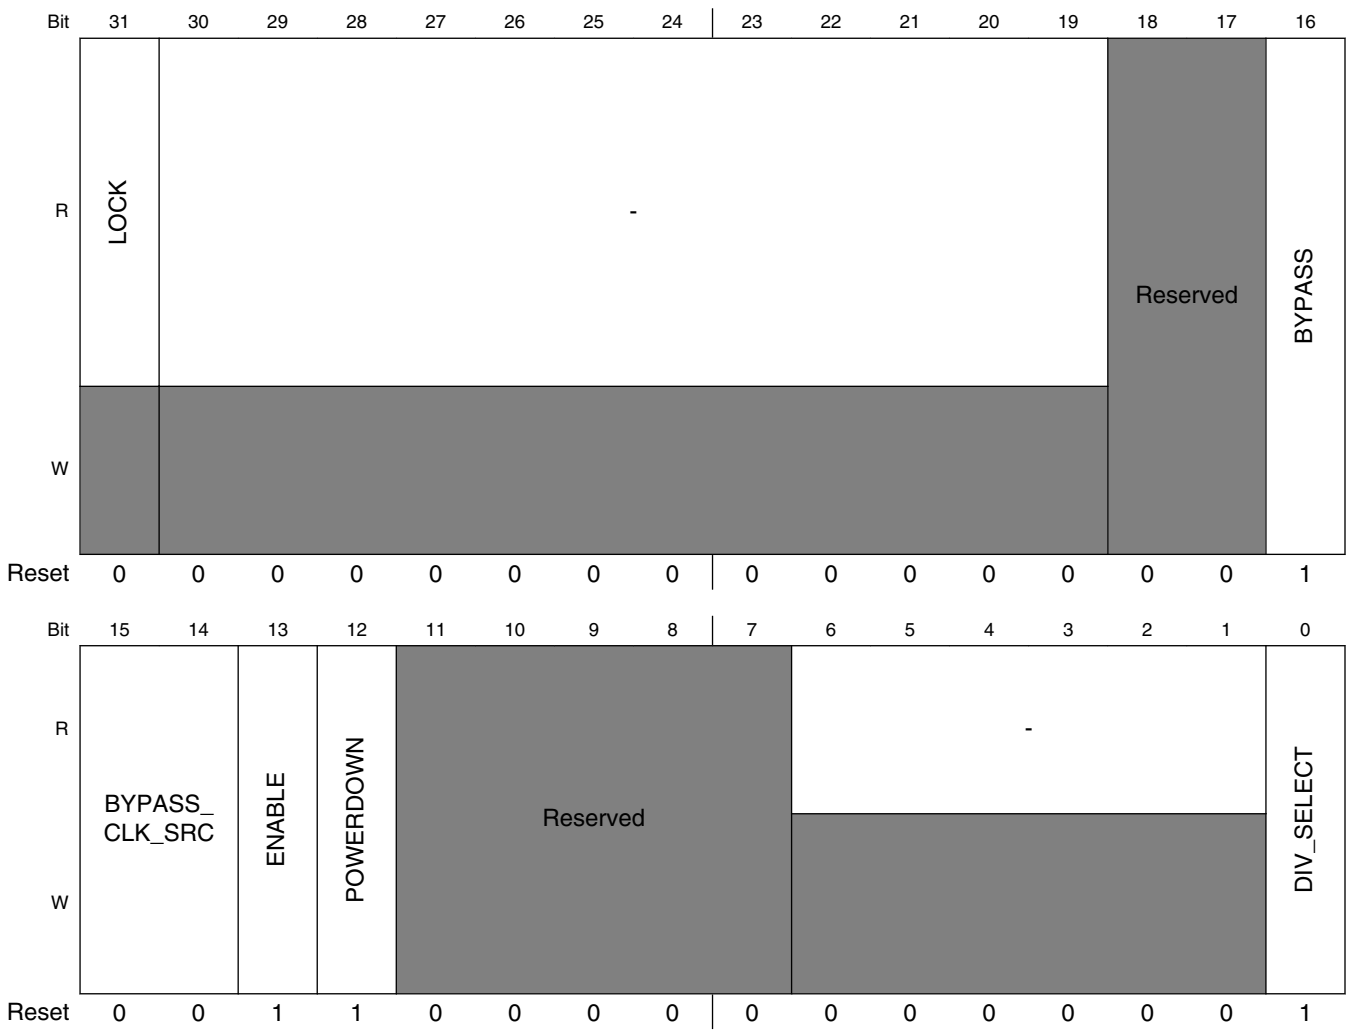
Address: 20C_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK	-														BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

CCM_ANALOG_PLL_USB2*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **CLK2** — Select the CLK2_N / CLK2_P as source. 0x3 **XOR** — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL).This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
1 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

Table continues on the next page...



CCM_ANALOG_PLL_USB2*n* field descriptions (continued)

Field	Description
0 -	This field is reserved. Reserved.

18.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYS*n*)

The control register provides control for the 528MHz PLL.

Address: 20C_8000h base + 30h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_SYS*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **CLK2** — Select the CLK2_N / CLK2_P as source. 0x3 **XOR** — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

18.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)

This register contains the 528MHz PLL spread spectrum controls.

Address: 20C_8000h base + 40h offset = 20C_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	STOP															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

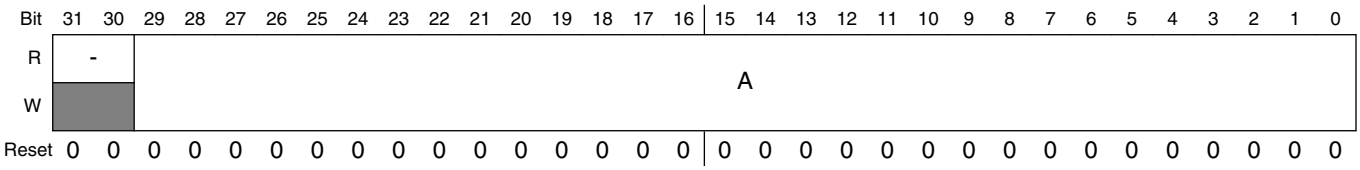
R W	ENABLE	STEP														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CCM_ANALOG_PLL_SYS_SS field descriptions



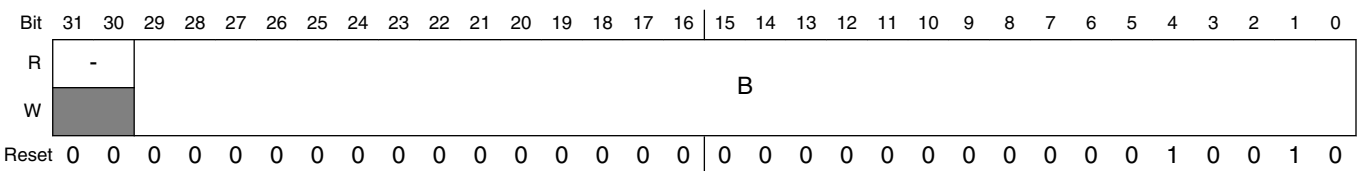
Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	Enable bit 0 — Spread spectrum modulation disabled 1 — Soread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator.

Address: 20C_8000h base + 50h offset = 20C_8050h



CCM_ANALOG_PLL_SYS_NUM field descriptions

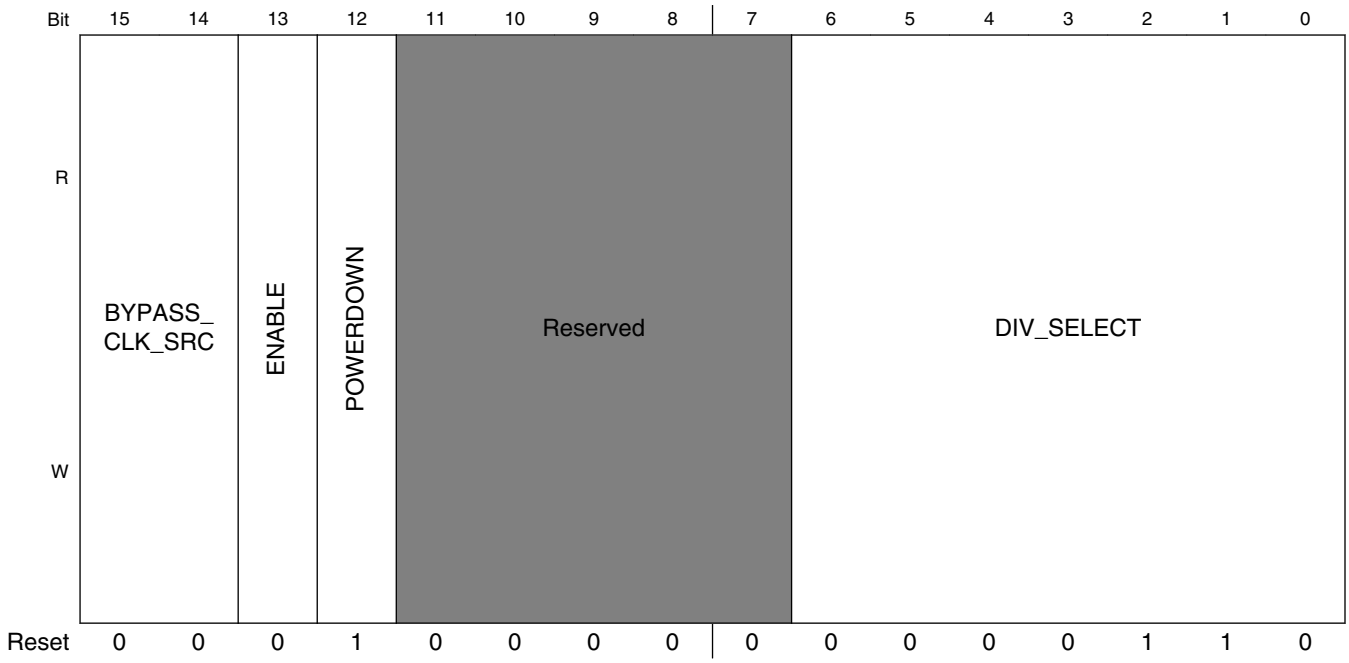
Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM)

This register contains the denominator of 528MHz PLL fractional loop divider.

Address: 20C_8000h base + 60h offset = 20C_8060h

CCM_ANALOG_PLL_SYS_DENOM field descriptions



Field	Description
31–30 -	Always set to zero (0).
B	30 bit denominator (B) of fractional loop divider (unsigned integer).

18.7.8 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO*n*)

The control register provides control for the audio PLL.

Address: 20C_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
31 LOCK	Lock bit 0 PLL is not currently locked 1 PLL is currently locked.
30–29 -	This field is reserved. Reserved.
28–26 MLB_FLT_RES_CFG	Configure the filter resistor for different divider ratio of MLB PLL.
25–23 RX_CLK_DELAY_CFG	Configure the phase delay of the MLB PLL RX Clock.
22–20 VDDD_DELAY_CFG	Configure the phase delay of the MLB PLL by adjusting the delay line in core Vdd poser domain.
19–17 VDDA_DELAY_CFG	Configure the phase delay of the MLB PLL by adjusting the delay line in Vddio power domain.
16 BYPASS	Bypass the PLL.
15–14 -	This field is reserved. Reserved.
13–12 PHASE_SEL	Analog debut bit.
11 HOLD_RING_OFF	Analog debug bit.
-	This field is reserved. Reserved.

18.7.15 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET*n*)

The control register provides control for the ENET PLL.

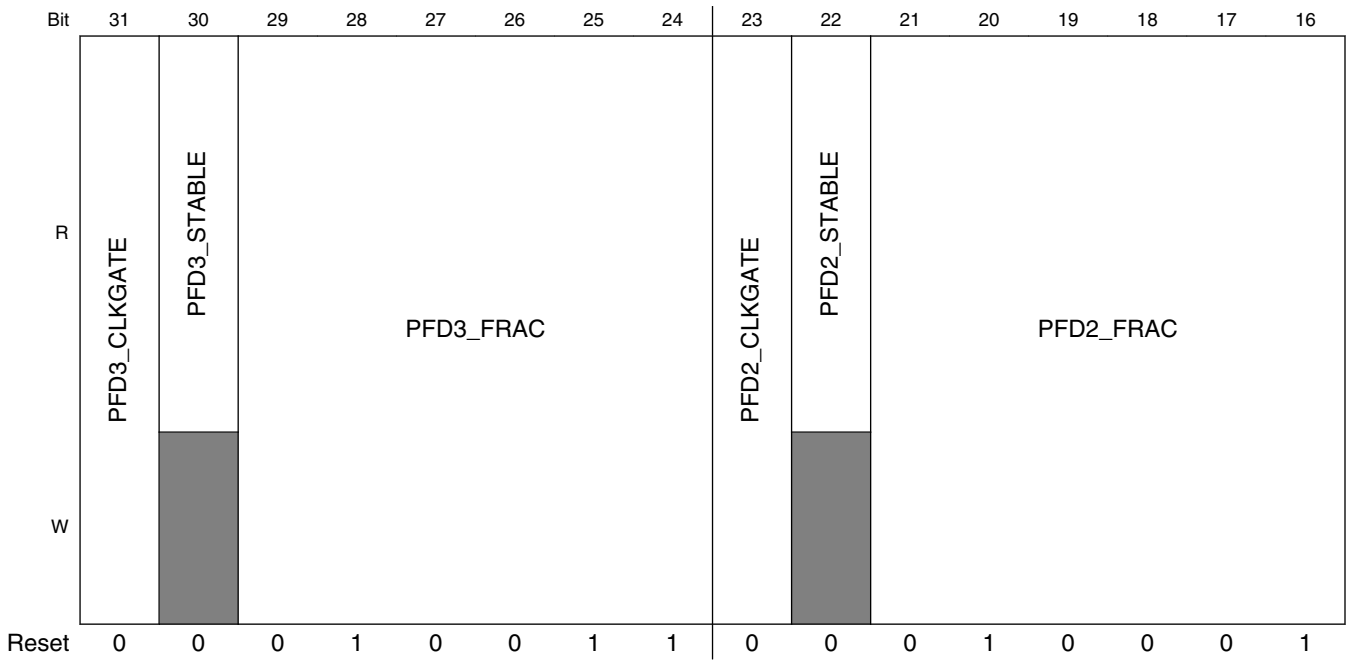
Address: 20C_8000h base + E0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ENET*n* field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–21 -	Always set to zero (0).
20 ENABLE_100M	Enables an offset in the phase frequency detector.

Table continues on the next page...

CCM_ANALOG_PLL_ENET*n* field descriptions (continued)



Field	Description
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 **REF_CLK_24M** — Select the 24MHz oscillator as source. 0x1 **CLK1** — Select the CLK1_N / CLK1_P as source. 0x2 **CLK2** — Select the CLK2_N / CLK2_P as source. 0x3 **XOR** — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the ethernet clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–2 -	Always set to zero (0).
DIV_SELECT	Controls the frequency of the ethernet reference clock.00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz;

18.7.16 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480*n*)

The PFD_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

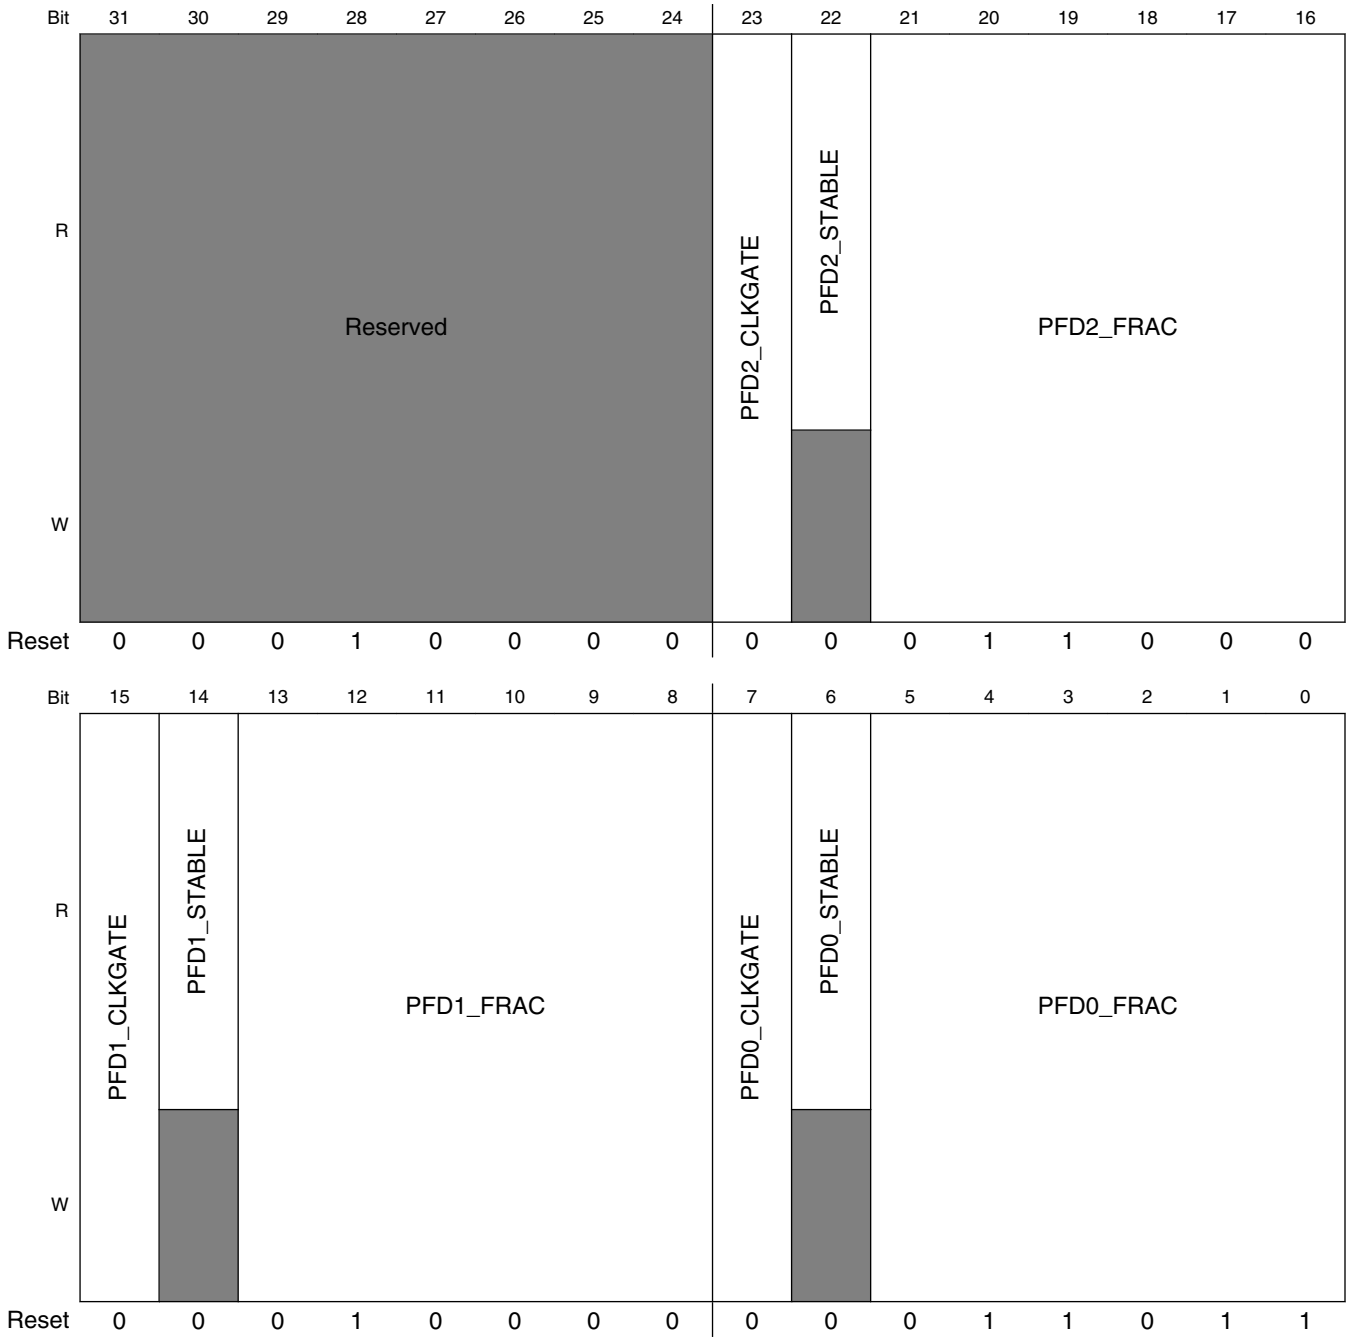
Address: 20C_8000h base + F0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_480*n* field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_480*n* field descriptions (continued)



Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD3_FRAC where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD2_FRAC where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD1_FRAC where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be 480*18/PFD0_FRAC where PFD0_FRAC is in the range 12-35.

18.7.17 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528*n*)

The PFD_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C_8000h base + 100h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_528*n* field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL powered down

Table continues on the next page...

CCM_ANALOG_MISC0*n* field descriptions

Field	Description
31–29 -	This field is reserved.
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. **NOTE:** Do not change the field during a low power event. This is not a field that the user would normally need to modify. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 0 **ALLOW_AUTO_GATE** — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 **NO_AUTO_GATE** — Prevent the logic from ever gating off the clock.
24–20 -	This field is reserved. Always set to zero.
19–18 WBCP_VPW_ THRESH	This signal alters the voltage that the pwell is charged pumped to. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 00 **NOMINAL_BIAS** — Nominal output pwell bias voltage. 01 **PLUS_25MV** — Increase pwell output voltage by 25mV. 10 **MINUS_25MV** — Decrease pwell output pwell voltage by 25mV. 11 **MINUS_50MV** — Decrease pwell output pwell voltage by 50mV.
17 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC)
16 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC)

Table continues on the next page...

CCM_ANALOG_MISC0*n* field descriptions (continued)

Field	Description
15–14 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable. **NOTE:** Not related to CCM. See Crystal Oscillator (XTALOSC) 00 **NOMINAL** — Nominal 01 **MINUS_12_5_PERCENT** — Decrease current by 12.5% 10 **MINUS_25_PERCENT** — Decrease current by 25.0% 11 **MINUS_37_5_PERCENT** — Decrease current by 37.5%
13 discon_high_ snvs	This bit forces the short between VDDHIGH_IN and VSNVS_IN to open when asserted. This is useful in power cases where SNVS_IN > VDDHIGH_IN. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
12 STOP_MODE_ CONFIG	Configure the analog behavior in stop mode. 0x0 **DEEP** — Deep Stop Mode - 0x0 All analog except RTC powered down on Stop mode assertion 0x1 **LIGHT** — Light Stop Mode - 0x1 All the analog domain except the LDO_1P1, LDO_2P5, and PLL3 is powered down on STOP mode assertion. If required the CCM can be configured not to power down the oscillator (XTALOSC). PLL3 can be disabled with register settings if desired.
11–8 -	This field is reserved. Reserved
7 REFTOP_ VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
6–4 REFTOP_ VBGADJ	**NOTE:** Not related to CCM. See Power Management Unit (PMU) 000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_ SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap. **NOTE:** Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2–1 -	This field is reserved.

Table continues on the next page...

CCM_ANALOG_MISC0*n* field descriptions (continued)

Field	Description
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry. **NOTE:** A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die. **NOTE:** Not related to CCM. See Power Management Unit (PMU)

18.7.19 Miscellaneous Register 1 (CCM_ANALOG_MISC1*n*)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anaclk1/1b and anaclk2/2b LVDS IO's.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCM_ANALOG_MISC2*n* field descriptions

Field	Description
31–30 VIDEO_DIV	Post-divider for video. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_VIDEOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
29–28 REG2_STEP_ TIME	Number of clock periods (24MHz clock). **NOTE:** Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
27–26 REG1_STEP_ TIME	Number of clock periods (24MHz clock).

Table continues on the next page...

CCM_ANALOG_MISC2*n* field descriptions (continued)

Field	Description
	NOTE: Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
25–24 REG0_STEP_TIME	Number of clock periods (24MHz clock). **NOTE:** Not related to CCM. See Power Management Unit (PMU) 00 **64_CLOCKS** — 64 01 **128_CLOCKS** — 128 10 **256_CLOCKS** — 256 11 **512_CLOCKS** — 512
23 AUDIO_DIV_MSB	MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4. **NOTE:** MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
22 REG2_OK	Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output > brownout_target **NOTE:** Not related to CCM. See Power Management Unit (PMU)
21 REG2_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
20 -	This field is reserved.
19 REG2_BO_STATUS	Reg2 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
18–16 REG2_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

Table continues on the next page...

CCM_ANALOG_MISC2*n* field descriptions (continued)

Field	Description
15 AUDIO_DIV_LSB	LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4. **NOTE:** LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value for more information. 00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
14 REG1_OK	GPU/VPU supply **NOTE:** Not related to CCM. See Power Management Unit (PMU)
13 REG1_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
12 -	This field is reserved.
11 REG1_BO_STATUS	Reg1 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 1 Brownout, supply is below target minus brownout offset.
10–8 REG1_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
7 PLL3_DISABLE	When USB is in low power suspend mode this Control bit is used to indicate if other system peripherals require the USB PLL3 clock when the SoC is not in low power mode. A user needs to set this bit if they want to optionally disable PLL3 while the SoC is not in any low power mode to save power. When the system does go into low power mode this bit setting would not have any affect. **NOTE:** When USB is in low power suspend mode users would need to ensure PLL3 is not being used before setting this bit in RUN mode. Please refer to the correct PLL disabling procedure in Disabling / Enabling PLLs 0 PLL3 is being used by peripherals and is enabled when SoC is not in any low power mode 1 PLL3 can be disabled when the SoC is not in any low power mode
6 REG0_OK	Arm supply **NOTE:** Not related to CCM. See Power Management Unit (PMU)

Table continues on the next page...

CCM_ANALOG_MISC2*n* field descriptions (continued)

Field	Description
5 REG0_ENABLE_BO	Enables the brownout detection. **NOTE:** Not related to CCM. See Power Management Unit (PMU)
4 -	This field is reserved.
3 REG0_BO_STATUS	Reg0 brownout status bit. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 1 Brownout, supply is below target minus brownout offset.
REG0_BO_OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. **NOTE:** Not related to CCM. See Power Management Unit (PMU) 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

Chapter 19
MIPI CSI to IPU Gasket (CSI2IPU)

19.1 Overview

The CSI2IPU gasket is a digital core that functions as a gasket interface between the MIPI CSI-2 host controller and the IPU system. This facilitates communication between a MIPI CSI-2 compliant camera sensor and IPU (the image processing unit). The gasket's main functions are to synchronize the CSI-2 input 32-bit data bus with the 16-bit data bus and to separate the four virtual channels.

The following block diagram shows the CSI2IPU gasket's position in the system as part of the CSI to IPU connectivity.

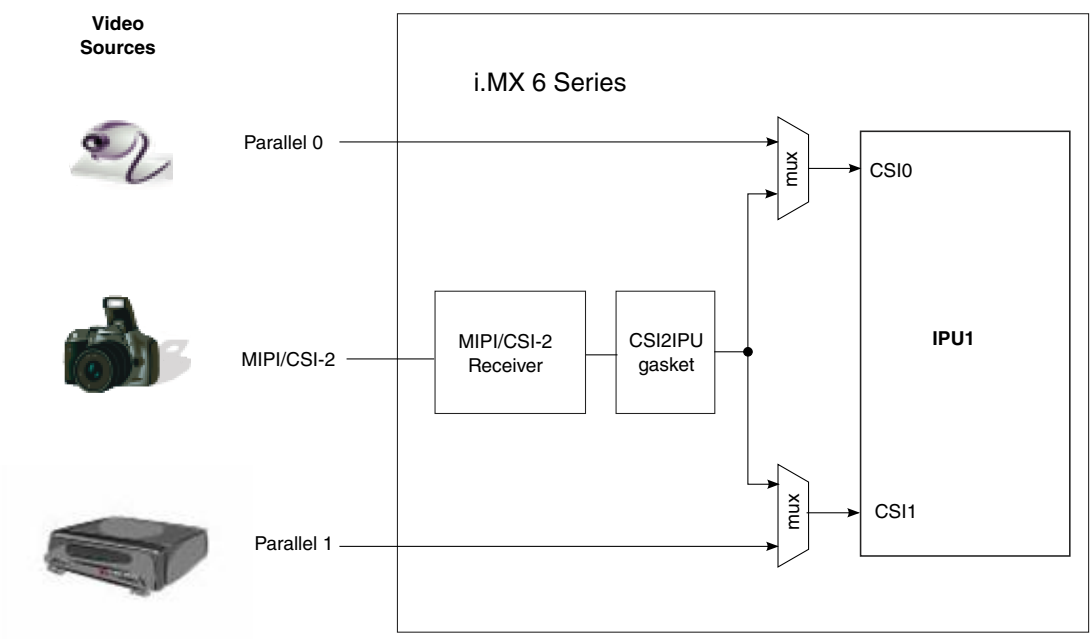

Figure 19-1. CSI2IPU gasket connectivity

19.1.1 CSI2IPU feature summary

The CSI2IPU gasket supports:

- Up to 4 virtual channels of MIPI CSI-2 host controller
- All data types of the MIPI Alliance Standard for Camera Serial Interface (CSI)
- Dynamically configurable pixel clock gating or non-gating for the IPU module
- Dynamically configurable RGB444 and YUV422 data format for the IPU module
- A software reset to reset the program during operation

19.1.2 CSI2IPU architectural description

The following figure shows the overall architecture of the CSI2IPU gasket.

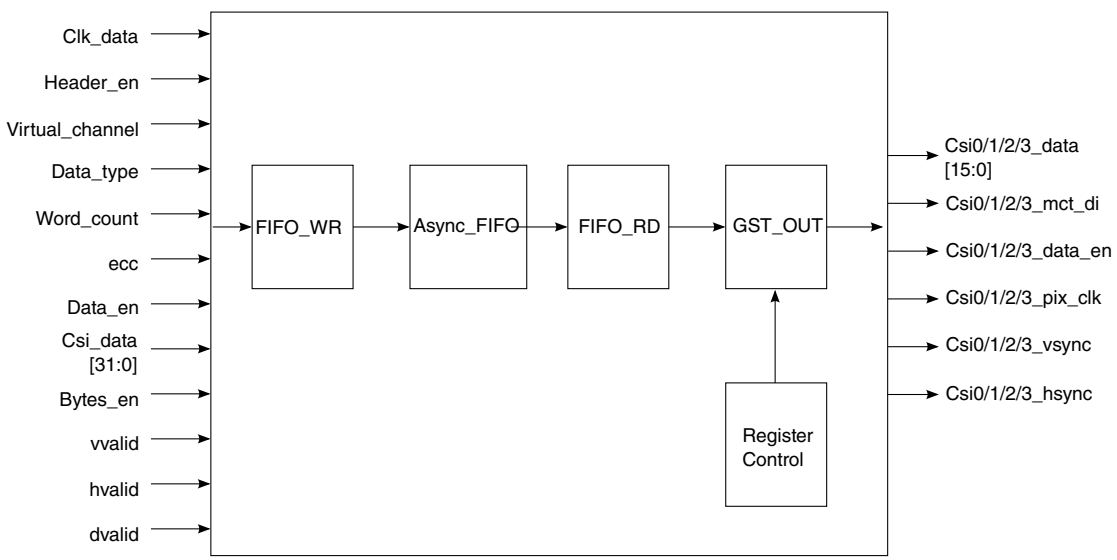

Figure 19-2. CSI2IPU gasket architecture

The main blocks are:

- FIFO WRITE—Responsible for receiving the CSI-2 host input signals and integrating them into a wr_data[46:0] bus
- ASYNC FIFO—Used to synchronize the wr_data to the read clock domain. It also generates FIFO full and empty signals.
- FIFO READ—Responsible for reading FIFO output and changing the 32-bit data bus to the 16-bit data bus.

- GST OUT—Generates output data according to the format controlled by the register bank.
- REGISTER CONTROL—register bank used to control the GST OUT block.

19.2 CSI2IPU signals

The following tables describe the CSI2IPU gasket's input and output signals.

Table 19-1. Input signals to CSI2IPU

Signal	Description
clk_data	Clock input for the CSI host controller
header_en	Shows that the header data at the input (signals virtual_channel, data_type, word_count, and ecc) is valid for the packet being transferred. This signal stays HIGH during the complete packet transfer.
virtual_channel[1:0]	Virtual channel identifier value • 00— VC0 • 01—VC1 • 10—VC2 • 11—VC3
data_type[5:0]	• 00h–07h—Synchronization short packet data types • 08h–0Fh—Generic short packet data types • 10h–17h—Generic long packet data types • 18h–1Fh—YUV data • 20h–27h—RGB data • 28h–2Fh—RAW data • 30h– 37h—User defined byte-based data • 38h–3Fh—Reserved
word_count[15:0]	16-bit word count information from the packet header
ecc[7:0]	8-bit error correction code for the packet header
data_en	Shows that new payload data is present at the input (signals csi_data and bytes_en). This signal is only asserted when receiving long packets. Note that the signal header_en is also asserted when data_en is asserted.
bytes_en[1:0]	Shows how may bytes are in the csi_data output signal • 00 = 1 valid byte in csi_data[7:0] • 01 = 2 valid bytes in csi_data[15:0] • 10 = 3 valid bytes in csi_data[23:0] • 11 = 4 valid bytes in csi_data[31:0]
vvalid[3:0]	This signal is asserted when a Frame Start is detected and de-asserted when a Frame End is detected. Each virtual channel has one valid signal. • vvalid[0]—vvalid for Virtual Channel 0 • vvalid[1]—vvalid for Virtual Channel 1 • vvalid[2]—vvalid for Virtual Channel 2 • vvalid[3]—vvalid for Virtual Channel 3
hvalid[3:0]	This signal is asserted when a Line Start is detected and de-asserted when a Line End is detected. Line Start and Line End are optional; when they are not available, hvalid has the same behavior as dvalid. Each virtual channel has one valid signal. • hvalid[0]—hvalid for Virtual Channel 0

Table continues on the next page...

Table 19-1. Input signals to CSI2IPU (continued)

Signal	Description
	• hvalid[1]—hvalid for Virtual Channel 1 • hvalid[2]—hvalid for Virtual Channel 2 • hvalid[3]—hvalid for Virtual Channel 3
dvalid[3:0]	Used to signal when valid data is available
csi_data_out[31:0]	Payload data
hw_resetn	System hardware reset
sft_resetn	System software reset from top module
gst_clk_sel	• 0—Gating clock mode • 1—Non-gating clock mode
gst_rgb444_fm	Rgb444 output format select • 0—{4'h0,r4g4b4} • 1—{r4,1'b0,g4,1'b0,b4,1'b0}
gst_yuv422_8bit_fm	Yuv422 output format select • 0—output YUYV • 1—output UYVY
ccm_pixel_clk	Reading clock from CCM

Table 19-2. CSI2IPU output signals to IPU

Signal	Description
csi*n*[1] _data[15:0]	Virtual channel *n*[1] CSI data
csi*n*[1] _mct_di[7:0]	Virtual channel *n*[1] {Channel_ID[1:0],Data type[5:0]}
csi*n*[1] _data_en	virtual channel *n*[1] data enable signal
csi*n*[1] _pix_clk	virtual channel *n*[1] pixel clock signal clock
csi*n*[1] _vsync	virtual channel *n*[1] vertical synchronism signal(Frame start)
csi*n*[1] _hsync	virtual channel *n*[1] horizontal synchronism signal
csi*n*[1] _Byte_en	virtual channel *n*[1] byte enable • 0–[7:0] valid • 1:[15:0] valid

1. n = 0 - 3

19.3 Timing interface

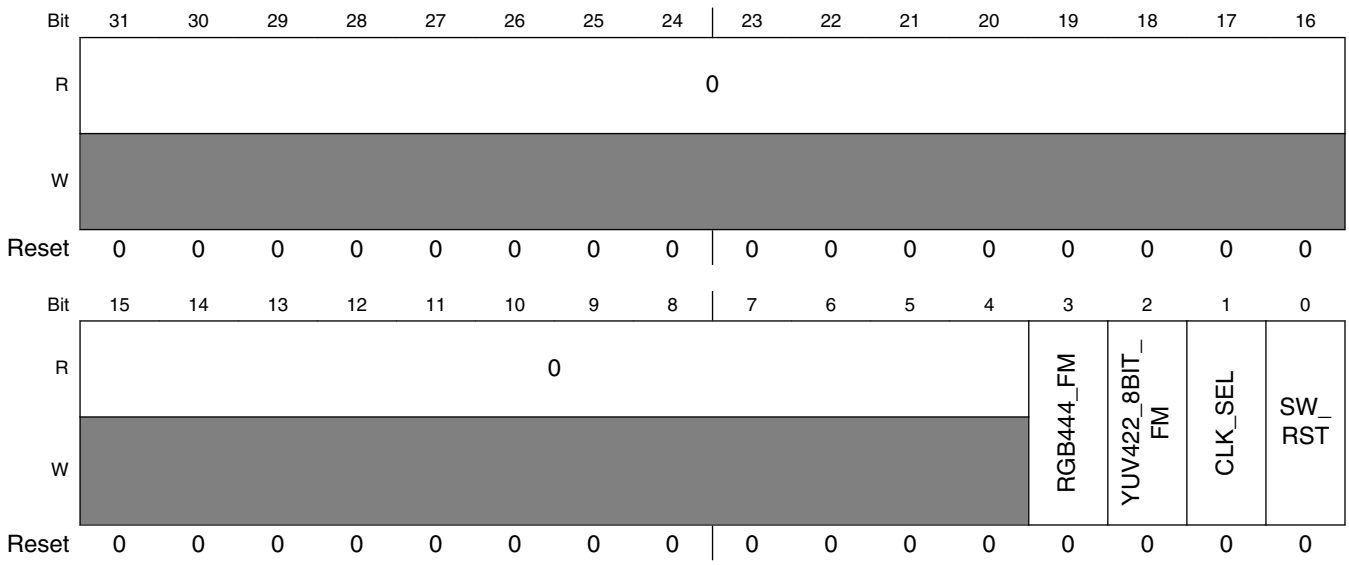
19.5 CSI2IPU Memory Map/Register Definition



CSI2IPU memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21D_CF00	CSI 2 IPU Gasket Software Reset (CSI2IPU_SW_RST)	32	R/W	0000_0000h	19.5.1/935

19.5.1 CSI 2 IPU Gasket Software Reset (CSI2IPU_SW_RST)

This register describes the IPU interface signals.

Address: 21D_C000h base + F00h offset = 21D_CF00h

CSI2IPU_SW_RST field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
3 RGB444_FM	rgb444 mode selection 0 {4'h0,r4b4g4} 1 {r4,1'b0,g4,2'b00,b4,1'b0}
2 YUV422_8BIT_FM	YUV422 8-bit mode selection 0 YUYV 1 UYVY
1 CLK_SEL	Clock mode selection 0 Gated Mode 1 Non-Gated Mode
0 SW_RST	Software Reset 0 Software Reset Disable 1 Software Reset Enable

Chapter 20
Display Content Integrity Checker (DCIC)

20.1 Overview

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

Using external muxing DCIC can monitor either one of the IPU display port outputs or feedback signals going from IO pads of Parallel display interface. The figure below shows DCIC integration in system with one IPU port.

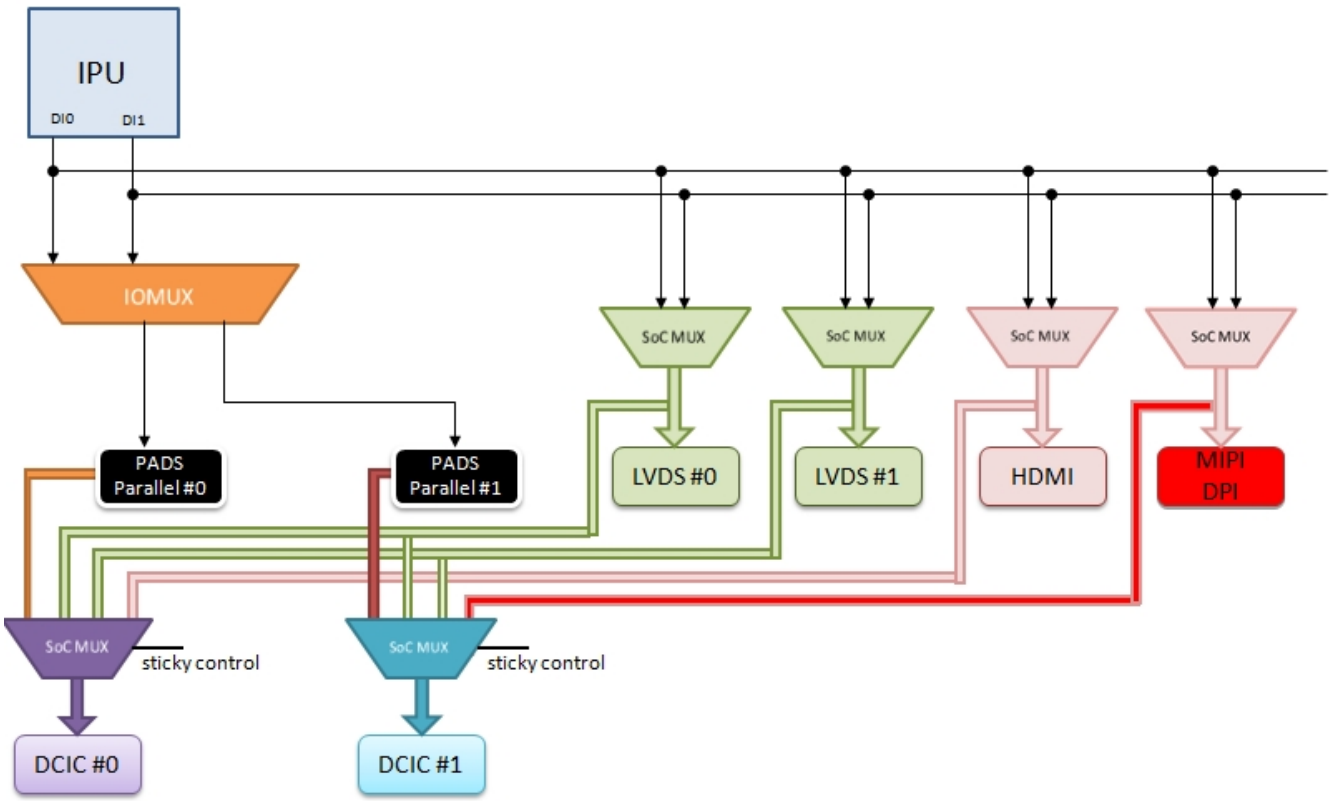


Figure 20-1. DCIC system integration example

20.1.1 Block Diagram

The figure below shows DCIC top level block diagram.

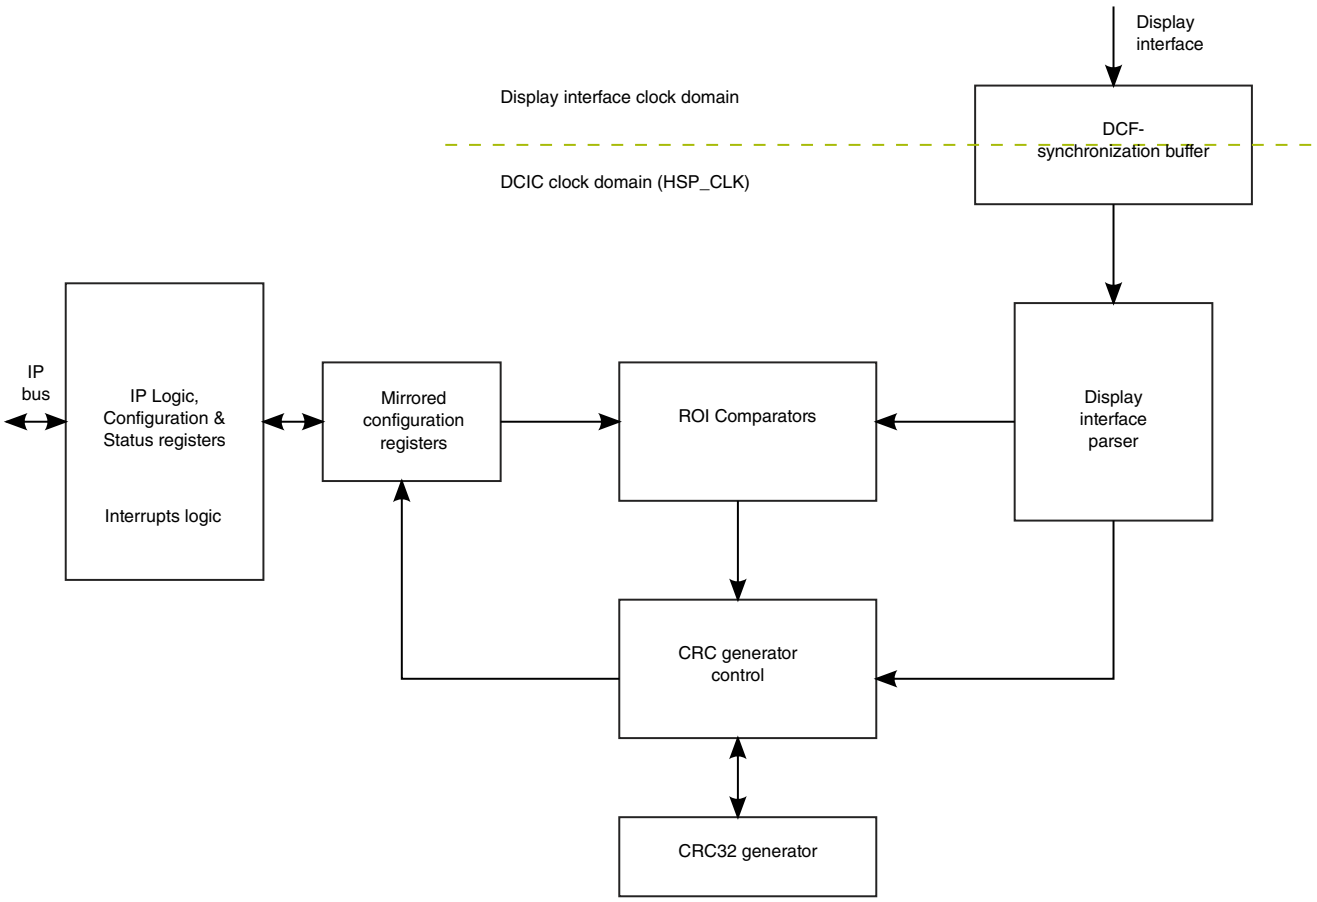

Figure 20-2. DCIC Block Diagram

20.1.2 Features

- Pixel clock up to 266 MHz
- Configurable polarity of Display Interface control signals
- 24-bit pixel data bus
- Up to 16 rectangular ROIs with a configurable location and size
- Independent CRC32 signature calculation for each ROI
- External controller mismatch indication signal

20.2 Functional Description

This section provides a complete functional description of the block.

20.2.1 Generic synchronous parallel display interface

The figure below depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with negative polarity, but both polarity modes are supported by DCIC through configuration of appropriate bits of DCICCR register.

The sequence of events for active matrix interface timing is:

- IPP_DISP_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP_DISP_CLK runs continuously.
- HSYNC causes the panel to start a new line.
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse.
- DRDY acts like an output enable signal. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off.

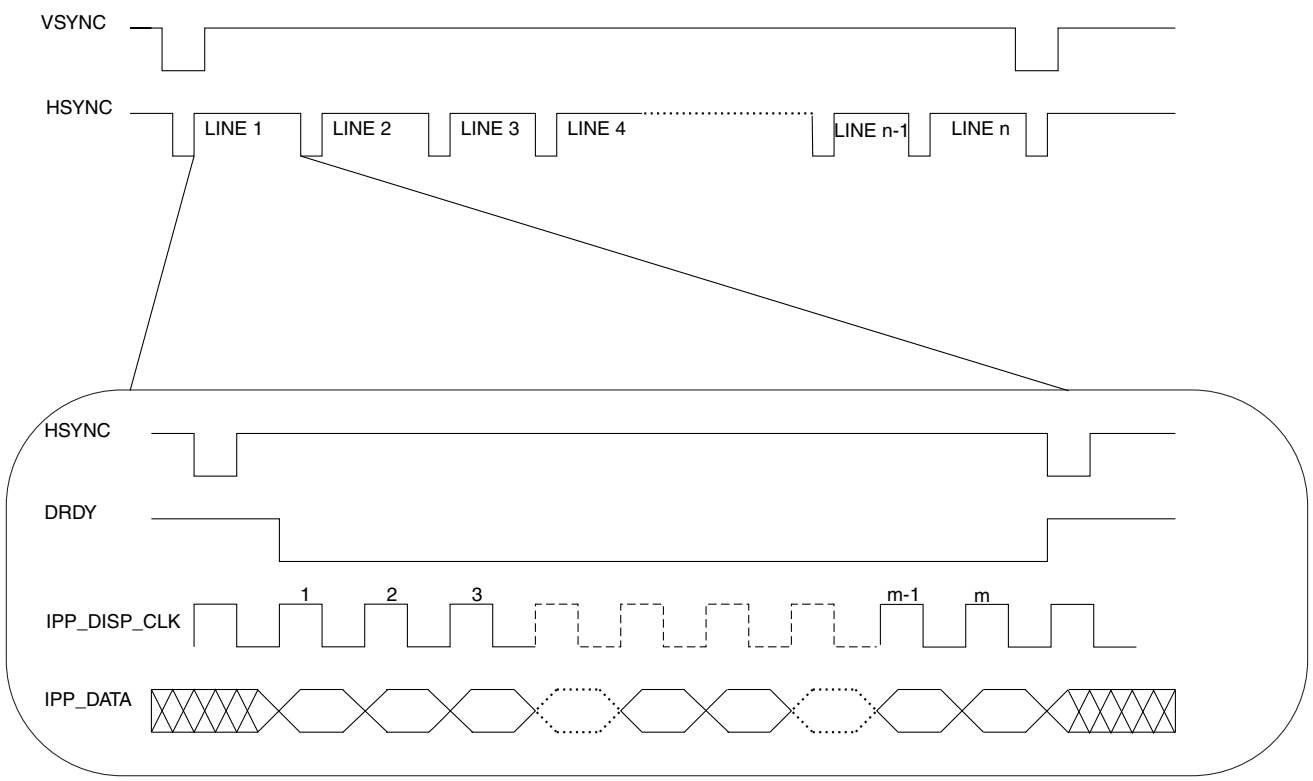

Figure 20-3. Interface Timing Diagram for TFT (Active Matrix) Panels

20.2.2 CRC Polynomial

DCIC uses the CRC32 polynomial to calculate the data signature.

Initial value for CRC calculation is 0x00000000.

$$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

CRC generator uses XOR-ed combination of input data bits and previous result bits.

20.2.3 Mode of operation

After DCIC is configured and enabled, providing IPU display interface is already enabled, first VSYNC is being watched. VSYNC assertion zeroizes main position counters and initializes CRC storage registers.

Each HSYNC assertion after first line in frame that holds valid pixel data (non blanking) will signal new line, i.e. increment Y-counter and zeroize X-counter. Each valid data cycle (DATA_EN asserted) will increment X-counter. Thus X & Y values used to configure the module should be the coordinates on the actual visual part of the screen without blanking intervals. X & Y position counters are constantly compared to ROIs configuration. When current position matches one of the enabled ROIs, it triggers the enablement of CRC generator, which will use the current pixel data and previous pixel CRC result for this ROI. The result of the new calculation stored separately for each ROI. Next VSYNC, apart of signalling new frame start, will cause sampling calculated CRC values into configuration registers domain. These values then will be compared to expected signatures and appropriate status bits / interrupts will be asserted.

20.2.4 Interrupts

There are two maskable interrupts:

- Functional - Asserted when match results ready.
- Error - Asserted when there is a signature mismatch.

Both interrupts are generated immediately after completing the signature match check. Software should clean the interrupts by writing "1" to appropriate status bits (FI_STAT, ROI_MATCH_STAT). EI_STAT bit is a result of OR between all ROI_MATCH_STAT bits, hence it will be cleared automatically when these bits are clear.

Interrupt masks can be set/reset only while FREEZE_MASK bit isn't set. This bit can not be set back to zero.

20.2.5 Software reset

Disabling and enabling the module operation (IC_EN bit, DCIC Control Register (DCIC_DCICC)) will reset all the logic apart of configuration registers domain. Status bits of DCICS (DCIC Status Register (DCIC_DCICS)) register will also be cleared.

20.2.6 Clock domains

Asynchronous FIFO is being used to sample raw display interface signals and transfer them into DCIC fast clock domain (hsp_clk).

Display interface clock is always slower than DCIC fast clock.

IP registers are driven by the same fast clock and will be synchronized to system IP Bus clock by external IP_SYNC module.

20.2.7 External controller mismatch indication signal

Besides of interrupts to SoC core, DCIC provides an additional mismatch indication for external controller. The signal, if enabled, continuously oscillating at a rate which is an integer division of the main clock (hsp clock).

- When the status bit of the mismatch interrupt is set - i.e. from mismatch detection until the CPU clears the bit: division x16
- Otherwise: division x4

The indication signal is idle while integrity check is disabled.

20.2.8 Power saving

Disabling the module by clearing IC_EN bit will stop all module activities, including sampling of input signals into the FIFO.

20.2.9 System Considerations

- The DCIC always assumes a 24-bit pixel. For proper functionality with lower color depth, one must ensure that:
  - When the CPU calculates the reference signature, it applies the same mapping of a pixel to a 24-bit field as that performed by the IPU.

    - The display is connected to the appropriate pins.
    - The simplest mapping would be
        - Map the pixel to the data bus in the same way as for 24 bpp
        - Set the values at the extra LSBs to zero.
- Parameter updates
    - The reference signature can be freely updated from frame to frame, in coordination with the changing content (since it is used only once per frame, just before the interrupt)
    - Each ROI can be freely and independently enabled/disabled between frames (since the enable bit is double buffered)
    - The size and location of a ROI can be modified while it is disabled.
    - Display interface signals polarity can be changed only when the module is disabled.
- ROI (regions of interest) don't overlap, i.e. each pixel belongs to single ROI at most.
- DCIC operation is intended for monitoring relatively static portions of graphic interface, otherwise it will be complicated software task to keep up with frame synchronization and update expected signature for each frame.
- There should be no processing done at IPU on monitored ROIs, which can't be taken in consideration by software when calculating the expected signature.

20.3 DCIC Memory Map/Register Definition

Important: All write accesses have to be full word (32-bit) accesses. No error/abort will be responded in case of different access size, but no data will be written. Similarly, there will be no error response in case of access to undefined memory space.

Read access will return 32-bit data, which may be truncated on system level in case it wasn't full word acces.

20.3.1 DCIC Control Register (DCICx_DCICC)

Address: Base address + 0h offset

DCICx_DCICC field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 CLK_POL	DISP_CLK signal polarity. 0 Not inverted (default). 1 Inverted.
6 VSYNC_POL	VSYNC_IN signal polarity.

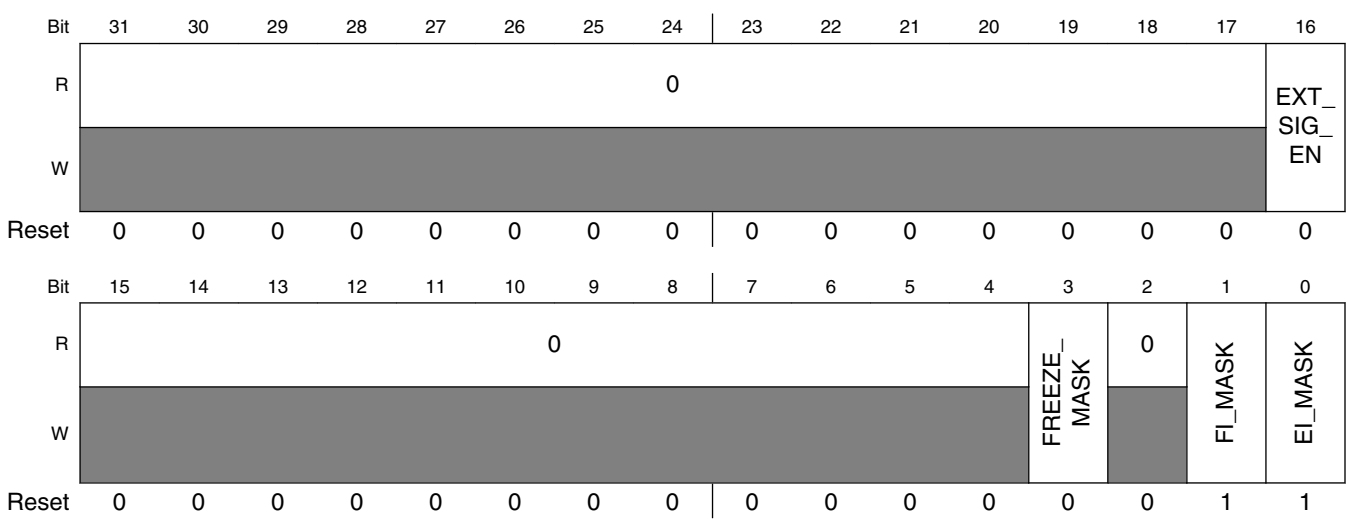

Table continues on the next page...

DCICx_DCICC field descriptions (continued)

Field	Description
	0 Active High. 1 Active Low (default).
5 HSYNC_POL	HSYNC_IN signal polarity. 0 Active High. 1 Active Low (default).
4 DE_POL	DATA_EN_IN signal polarity. 0 Active High. 1 Active Low (default).
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 IC_EN	Integrity Check enable. Main enable switch. 0 Disabled 1 Enabled

20.3.2 DCIC Interrupt Control Register (DCICx_DCICIC)

Address: Base address + 4h offset

DCICx_DCICIC field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 EXT_SIG_EN	External controller mismatch indication signal. 0 Disabled (default) 1 Enabled

Table continues on the next page...

DCICx_DCICIC field descriptions (continued)

Field	Description
15–4 Reserved	This read-only field is reserved and always has the value 0.
3 FREEZE_MASK	Disable change of interrupt masks. "Sticky" bit which can be set once and cleared by reset only. 0 Masks change allowed (default) 1 Masks are frozen
2 Reserved	This read-only field is reserved and always has the value 0.
1 FI_MASK	Functional Interrupt mask. Can be changed only while FREEZE_MASK = 0. 0 Mask disabled - Interrupt assertion enabled 1 Mask enabled - Interrupt assertion disabled (default)
0 EI_MASK	Error Interrupt mask. Can be changed only while FREEZE_MASK = 0. 0 Mask disabled - Interrupt assertion enabled 1 Mask enabled - Interrupt assertion disabled (default)

20.3.3 DCIC Status Register (DCICx_DCICS)

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0														FI_STAT	EI_STAT

Field	Description
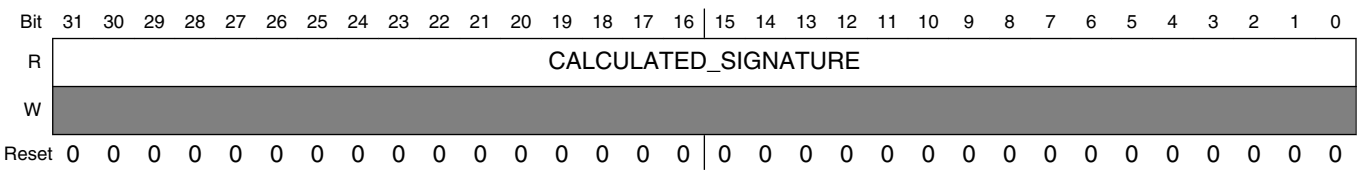
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 END_OFFSET_Y	Row number of ROIs lower-right corner (Y coordinate) Range: 1 to 2^12-1
15–13 Reserved	This read-only field is reserved and always has the value 0.
END_OFFSET_X	Column number of ROIs lower-right corner (X coordinate) Range: 1 to 2^13-1

20.3.6 DCIC ROI Reference Signature Register m (DCICx_DCICRRS)

Address: Base address + 18h offset



DCICx_DCICRRS field descriptions

Field	Description
REFERENCE_ SIGNATURE	32-bit expected signature (CRC calculation result) for ROI #m

20.3.7 DCIC ROI Calculated Signature m (DCICx_DCICRCS)

Address: Base address + 1Ch offset

DCICx_DCICRCS field descriptions

Field	Description
CALCULATED_ SIGNATURE	32-bit actual signature (CRC calculation result) for ROI #m during the last frame. Updated automatically at the beginning of a next frame.

Chapter 21
Enhanced Configurable SPI (ECSPI)

21.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

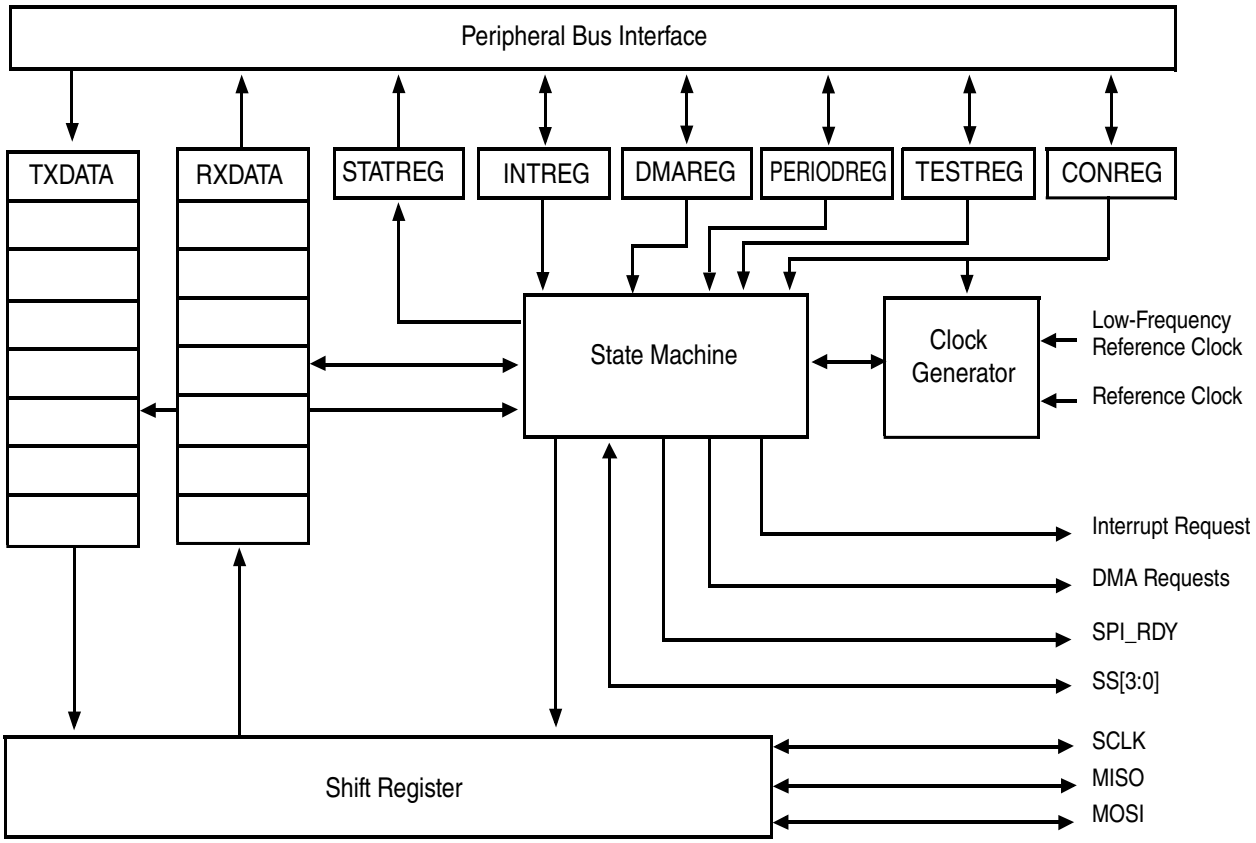


Figure 21-1. ECSPI Block Diagram

21.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Refer to the product data sheet for the maximum operating frequency

21.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- Master Mode
- Slave Mode
- Low Power Modes

As described in Operations, the ECSPI supports the operations described in the indicated sections:

- Typical Master Mode
  - Master Mode with SPI_RDY
  - Master Mode with Wait States
  - Master Mode with SS_CTL[3:0] Control
  - Master Mode with Phase Control
- Typical Slave Mode

21.2 External Signals

The following table describes the external signals of ECSPI:

Table 21-1. ECSPI1 External Signals

Signal	Description	Pad	Mode	Direction
ECSPI1_MISO (MISO)	Master data in; slave data out	CSI0_DAT6	ALT2	IO
		DISP0_DAT22	ALT2	
		EIM_D17	ALT1	
		KEY_COL1	ALT0	
ECSPI1_MOSI (MOSI)	Master data out; slave data in	CSI0_DAT5	ALT2	IO
		DISP0_DAT21	ALT2	
		EIM_D18	ALT1	
		KEY_ROW0	ALT0	
ECSPI1_RDY (RDY)	SPI data ready signal	GPIO_19	ALT4	I
ECSPI1_SCLK (SCLK)	SPI clock signal	CSI0_DAT4	ALT2	IO
		DISP0_DAT20	ALT2	
		EIM_D16	ALT1	
		KEY_COL0	ALT0	
ECSPI1_SS0 (SS0)	Chip select signal	CSI0_DAT7	ALT2	IO
		DISP0_DAT23	ALT2	
		EIM_EB2	ALT1	
		KEY_ROW1	ALT0	

Table continues on the next page...

Table 21-1. ECSPI1 External Signals (continued)

Signal	Description	Pad	Mode	Direction
ECSPI1_SS1 (SS1)	Chip select signal	DISP0_DAT15	ALT2	IO

ECSPI4_SS3 (SS3)	Chip select signal	EIM_D25	ALT1	IO

Figure 21-2 shows the ECSPI in master mode connected to four external devices in a one-way communication link.

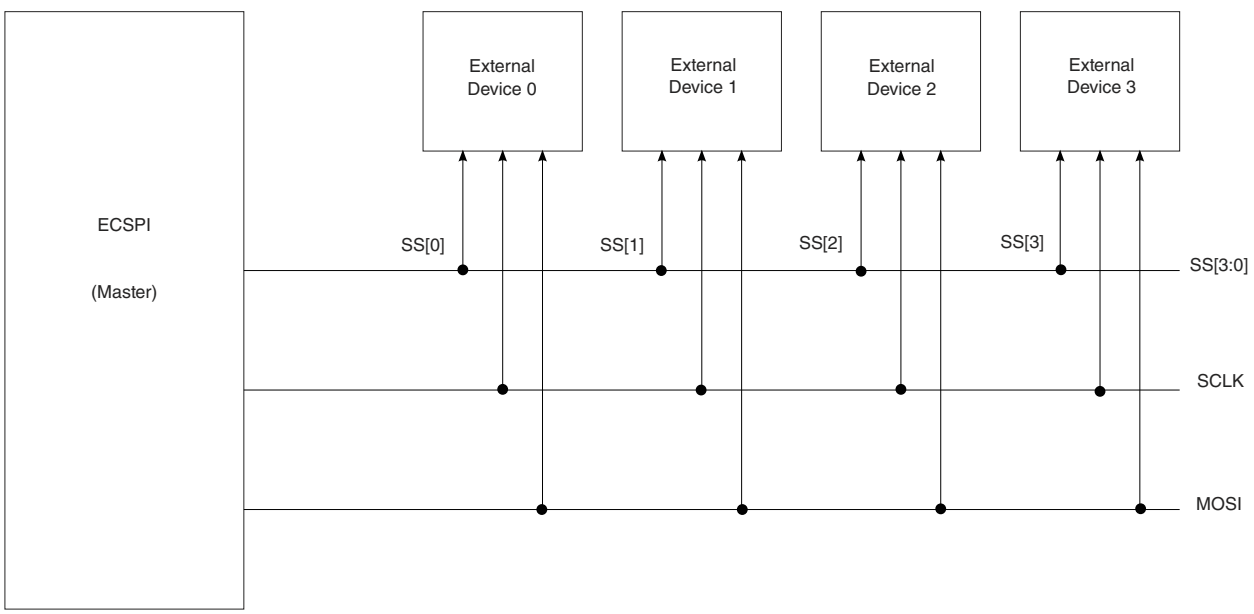

Figure 21-2. Example Connection Diagram

21.3 Clocks

The following table describes the clock sources for eCSPI. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 21-5. eCSPI Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

21.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

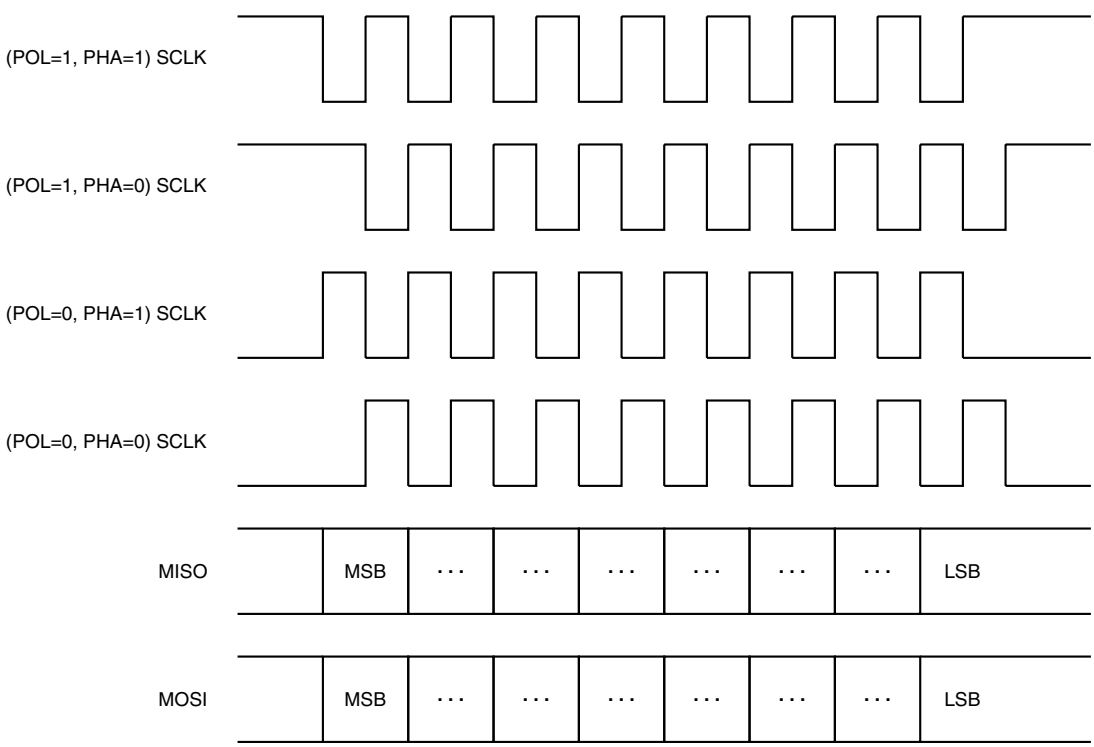

Figure 21-3. ECSPI SCLK, MISO, and MOSI Relationship

21.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

21.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select (SS) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when ECSPIx_CONFIGREG[SS_CTL] is cleared. The accurate burst length should always be specified using the BURST_LENGTH parameter. ECSPIx_CONFIGREG[SS_CTL] set to 1 is not supported in slave mode.

21.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

21.4.4 Operations

The information found here describes the ECSPI's operations.

21.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

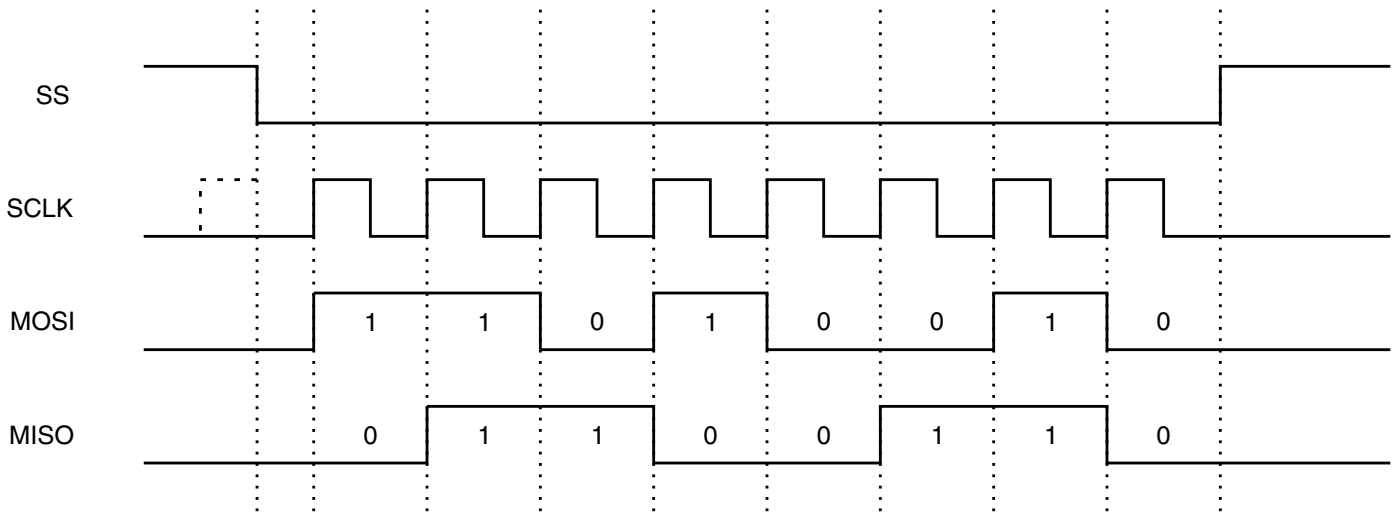

Figure 21-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

21.4.4.1.1 Master Mode with SPI_RDY

By default, the ECSPI does not use the SPI_RDY signal in master mode (MODE =1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI_CONREG[XCH] bit or the ECSPI_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI_CONREG[DRCTL]) bits contains either 01 or 10, the SPI_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI_RDY signal.

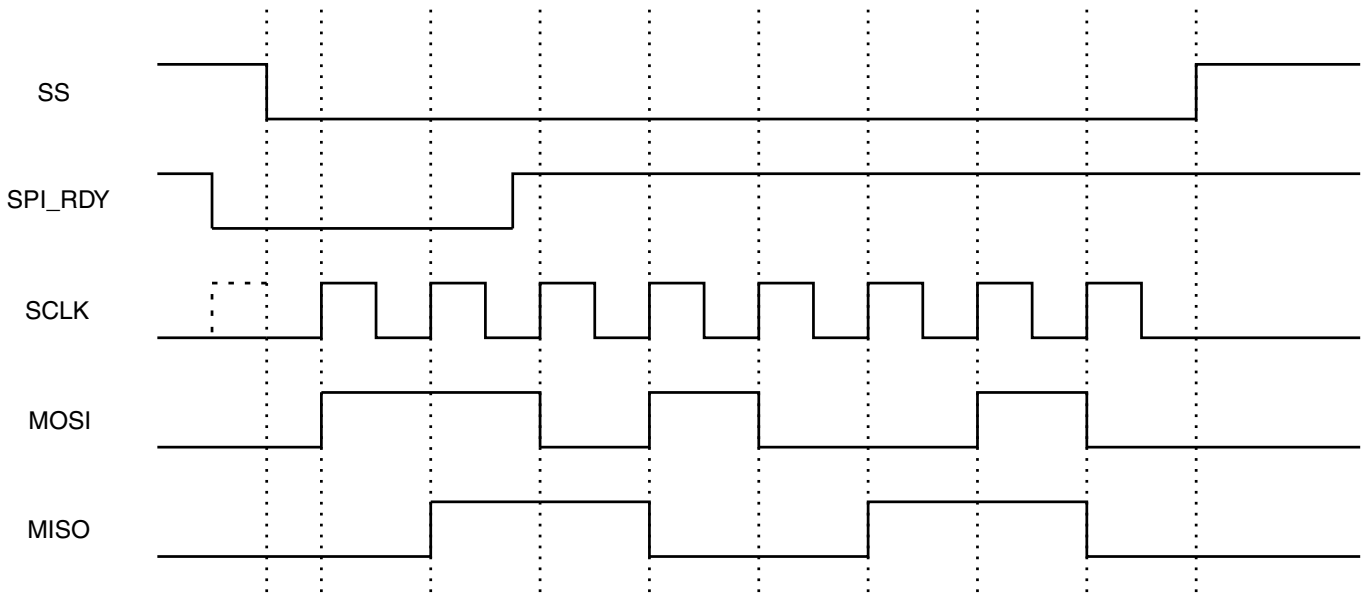

Figure 21-5. Relationship Between a SPI Burst and SPI_RDY: Falling-Edge Triggered

A SPI burst does not start until the falling edge of the SPI_RDY signal is detected. The next SPI burst starts when the next SPI_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI_RDY signal. The SPI burst does not begin until the SPI_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI_RDY signal remains low.

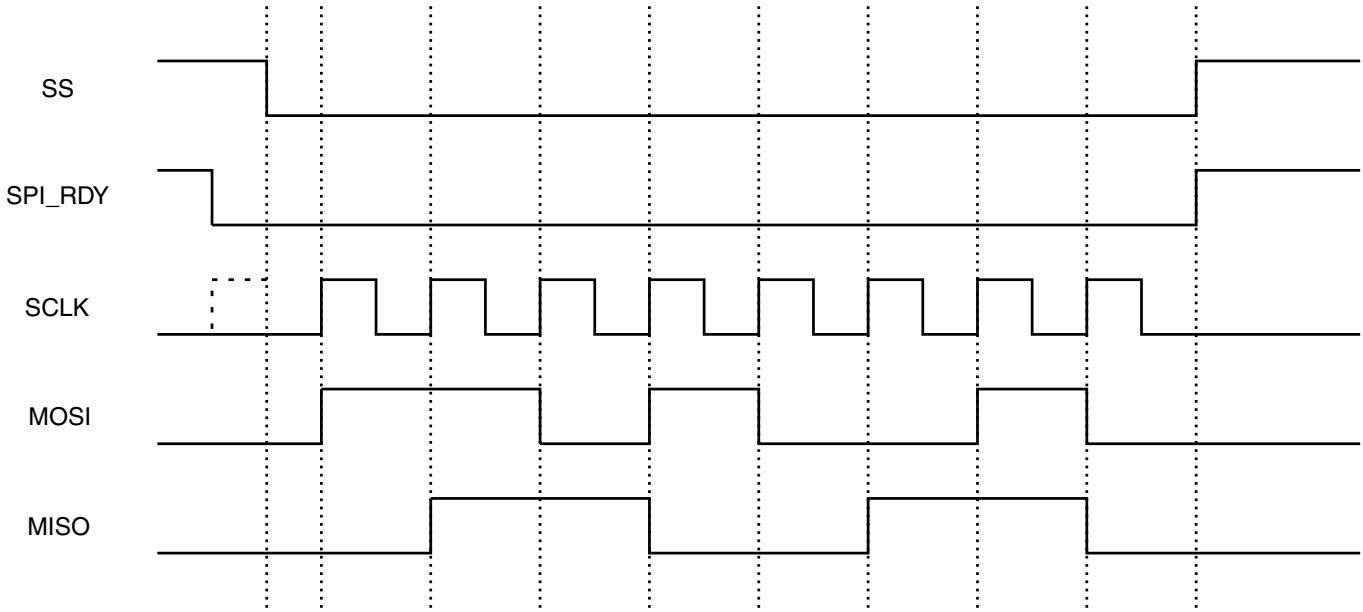

Figure 21-6. Relationship Between a SPI Burst and SPI_RDY: Low-Level Triggered

21.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

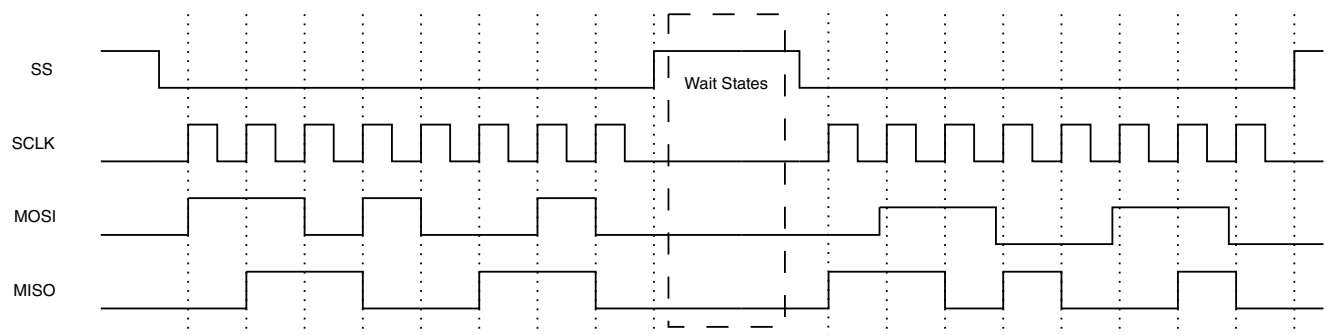

Figure 21-7. SPI Bursts with Wait States

In this case, the number of wait states is controlled by ECSPI_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI_PERIODREG[CSRC].

21.4.4.1.3 Master Mode with SS_CTL[3:0] Control

The SPI SS Control (SS_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI_CONREG register.

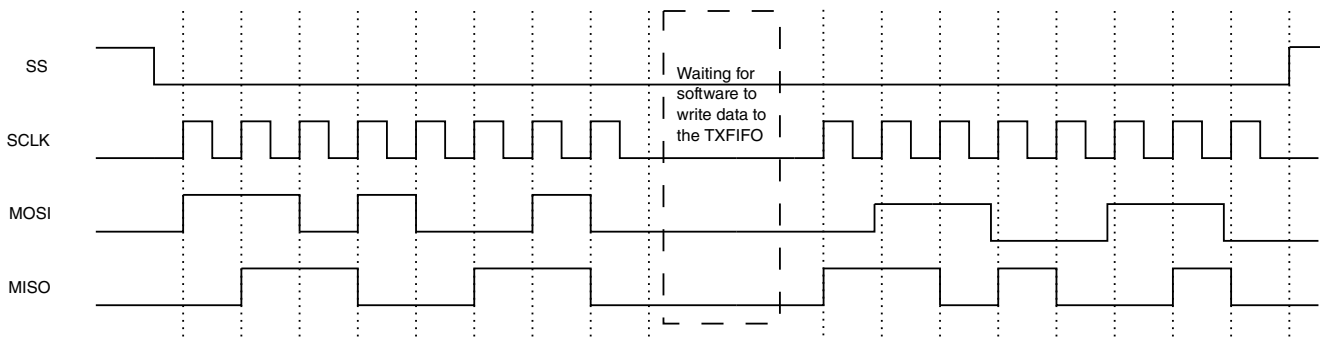

Figure 21-8. SPI Burst While SS_CTL[3:0] is Clear

In Figure 21-8, two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined by the BURST LENGTH and limited by the FIFO size. (Figure 21-8 corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

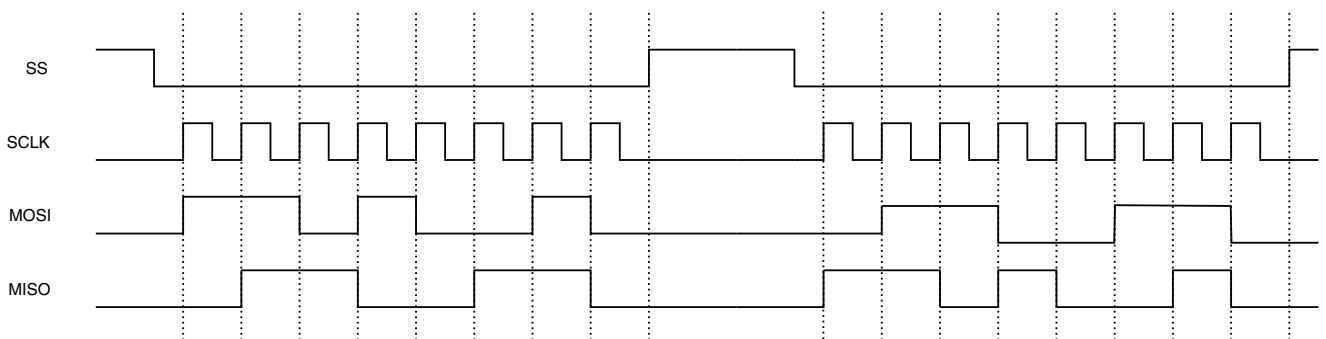

Figure 21-9. SPI Bursts While SS_CTL[3:0] is Set

In Figure 21-9, two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

21.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. Figure 21-10 shows how SPI burst works with different POL and PHA configuration.

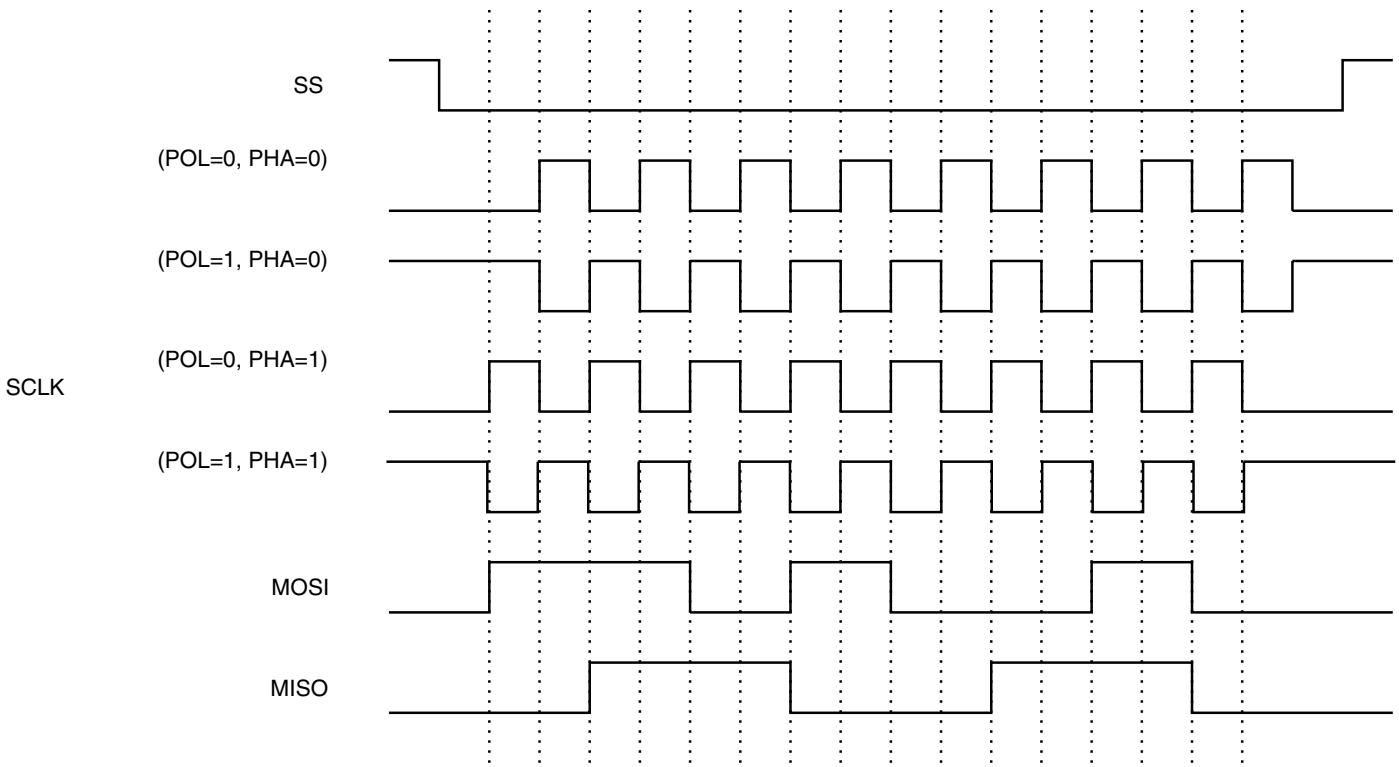

Figure 21-10. SPI Burst with Different POL and PHA Configurations

21.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, SS becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS_POL=0 is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SS_POL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

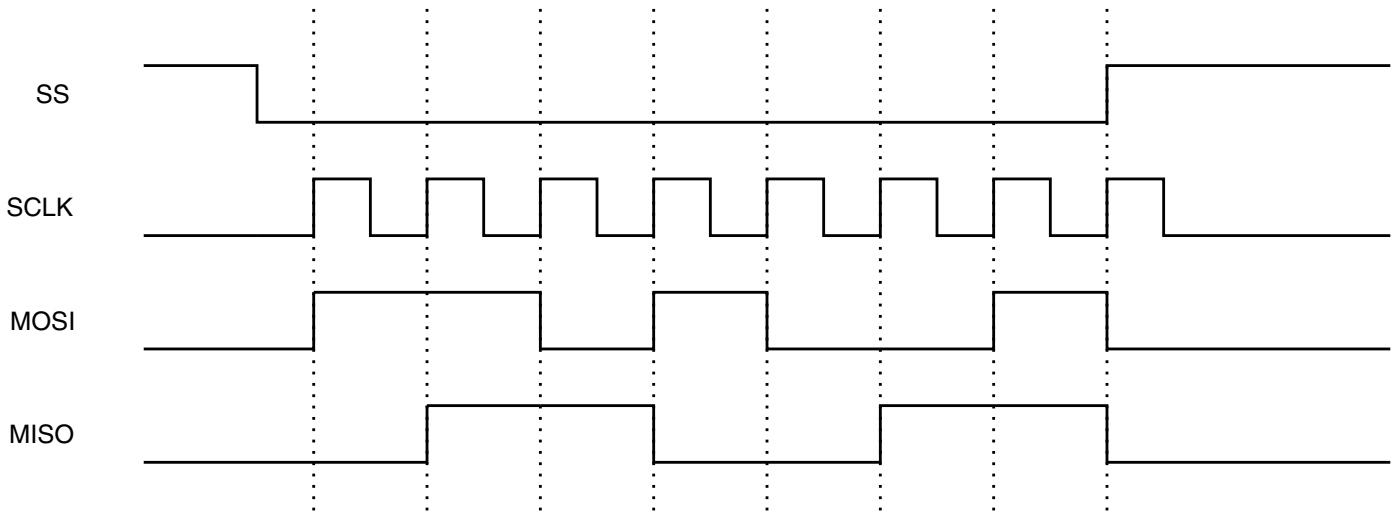

Figure 21-11. Advancing the Data FIFO on the Rising Edge of SS

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

21.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see ECSPI.

21.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

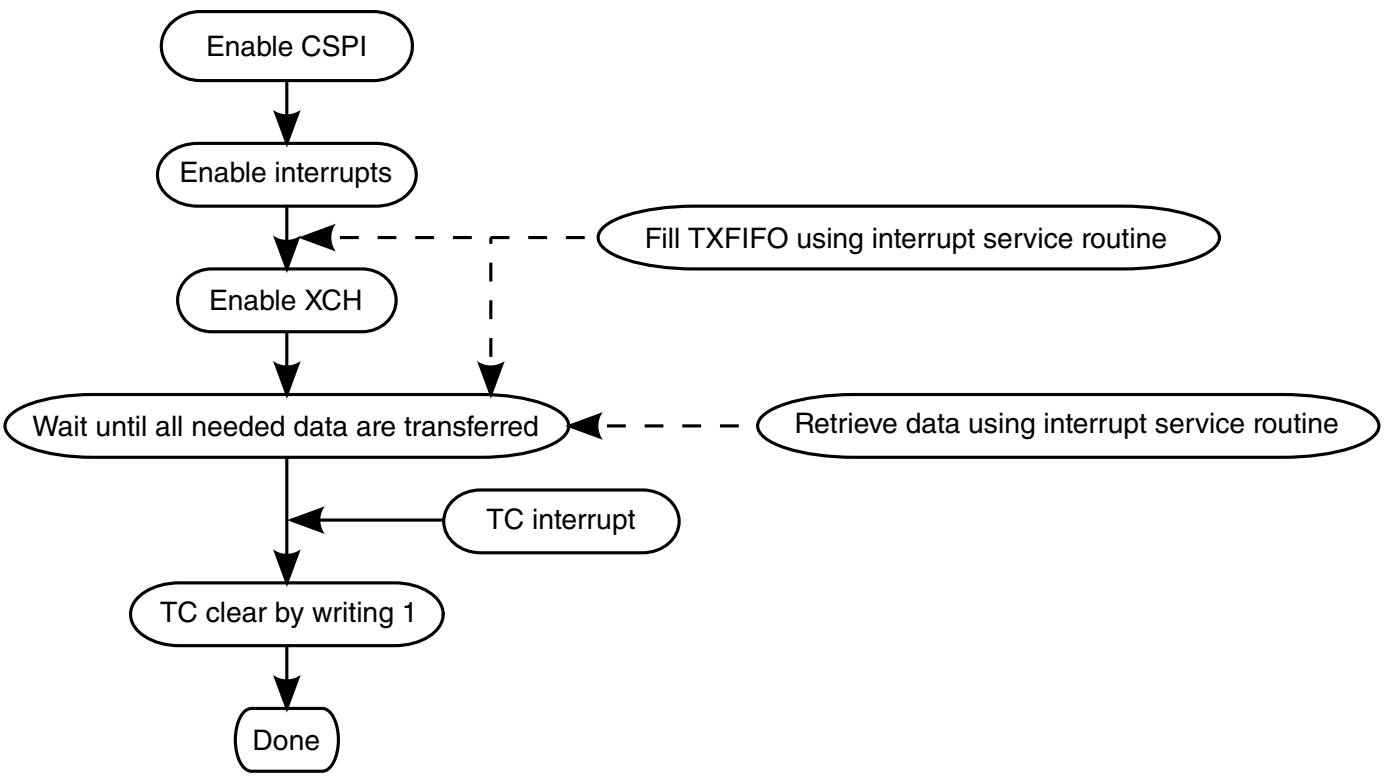

Figure 21-12. Program Sequence of SPI Burst Using Interrupt Control

NOTE

The TC bit does not provide a reliable indication that the transfer is complete. Under some conditions, the TC interrupt can occur before the transfer is completed. If the TC bit is used as an interrupt source, the XCH bit should be polled after the TC interrupt occurs to accurately confirm that the transfer is complete.

21.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

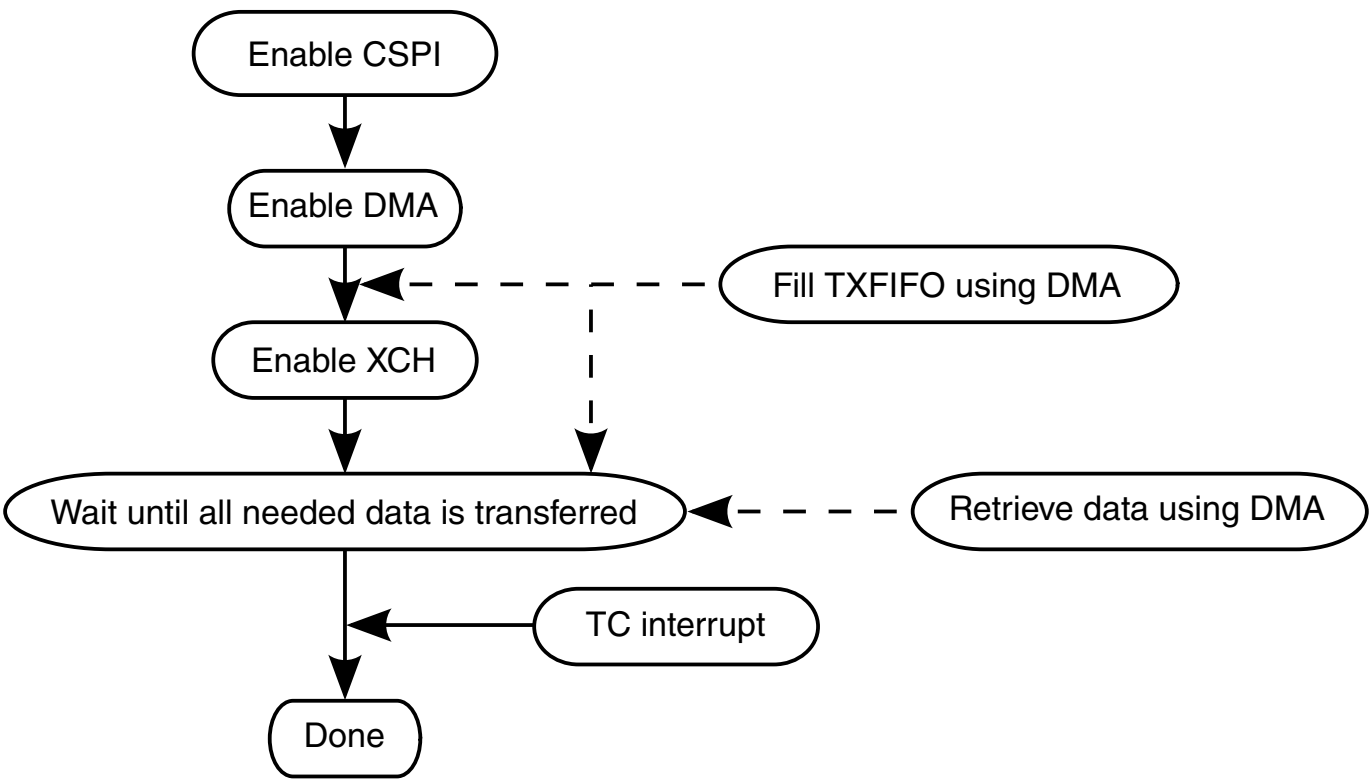

Figure 21-13. Program Sequence of SPI Burst Using DMA

NOTE

The TC bit does not provide a reliable indication that the transfer is complete. Under some conditions, the TC interrupt can occur before the transfer is completed. If the TC bit is used

as an interrupt source, the XCH bit should be polled after the TC interrupt occurs to accurately confirm that the transfer is complete.

21.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

21.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI_CONREG to reset the block.
2. Enable the clocks for ECSPI within the CCM.
3. Configure the Control Register and then set the EN bit in the ECSPI_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

21.6 Applications

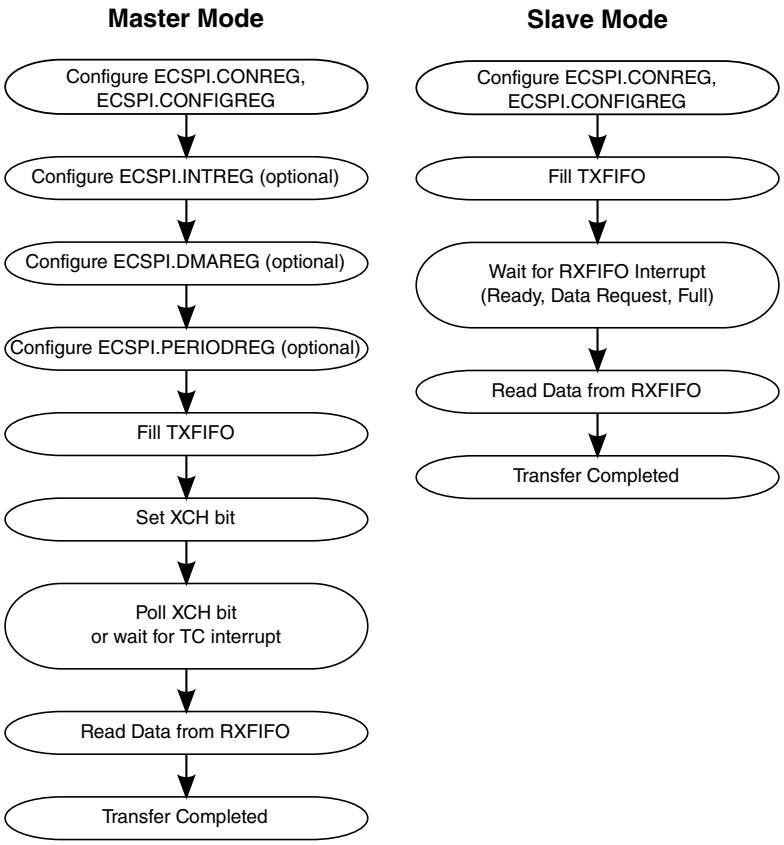

Figure 21-14. Flowchart of the ECSPI Operation

NOTE

The TC bit does not provide a reliable indication that the transfer is complete. Under some conditions, the TC interrupt can occur before the transfer is completed. If the TC bit is used as an interrupt source, the XCH bit should be polled after the TC interrupt occurs to accurately confirm that the transfer is complete.

21.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
200_8000	Receive Data Register (ECSPI1_RXDATA)	32	R	0000_0000h	21.7.1/969

21.7.1 Receive Data Register (ECSPIx_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

21.7.2 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BURST_LENGTH field of the corresponding SPI Control register. If this field contains more bits than the number specified by BURST_LENGTH, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

21.7.3 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	BURST_LENGTH												CHANNEL_ SELECT		DRCTL

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONREG field descriptions

Field	Description
31–20 BURST_ LENGTH	Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2^12 bits can be transferred in a single SPI burst. In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant (n = BURST LENGTH + 1) will be shifted out. The remaining bits will be ignored. Number of Valid Bits in a SPI burst. 0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and 2^7 -1 words. 0xFFF A SPI burst contains 2^7 words.
19–18 CHANNEL_ SELECT	SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SSn) outputs. Only the selected Chip Select (SSn) signal can be active at a given time; the remaining three signals will be negated. 00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.
17–16 DRCTL	SPI Data Ready Control. This field selects the utilization of the SPI_RDY signal in master mode. ECSPI checks this field before it starts an SPI burst. 00 The SPI_RDY signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.
15–12 PRE_DIVIDER	SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock. 0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.
11–8 POST_DIVIDER	SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: 2^{n} . 0000 Divide by 1. 0001 Divide by 2.

Table continues on the next page...

ECSPIx_CONREG field descriptions (continued)

Field	Description
	0010 Divide by 4. ... 1110 Divide by 2^{14}. 1111 Divide by 2^{15}.
7–4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPI_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

21.7.4 Config Register (ECSPIx_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved			HT_LENGTH					SCLK_CTL				DATA_CTL				SS_POL				SS_CTL				SCLK_POL				SCLK_PHA			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

ECSPIx_CONFIGREG field descriptions (continued)

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL bits are ignored if the SMC bit is set. SS CTL[3] is for SPI channel 3. SS CTL[2] is for SPI channel 2. SS CTL[1] is for SPI channel 1. SS CTL[0] is for SPI channel 0. In slave mode, this bit controls when the SPI burst is completed. An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data. 0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty. 0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid. 1 Reserved
7–4 SCLK_POL	SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 21-10 for more information. SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0. 0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).
SCLK_PHA	SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 21-10 for more information. SCLK PHA[3] is for SPI channel 3. SCLK PHA[2] is for SPI channel 2. SCLK PHA[1] is for SPI channel 1. SCLK PHA[0] is for SPI channel 0. 0 Phase 0 operation. 1 Phase 1 operation.

21.7.5 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

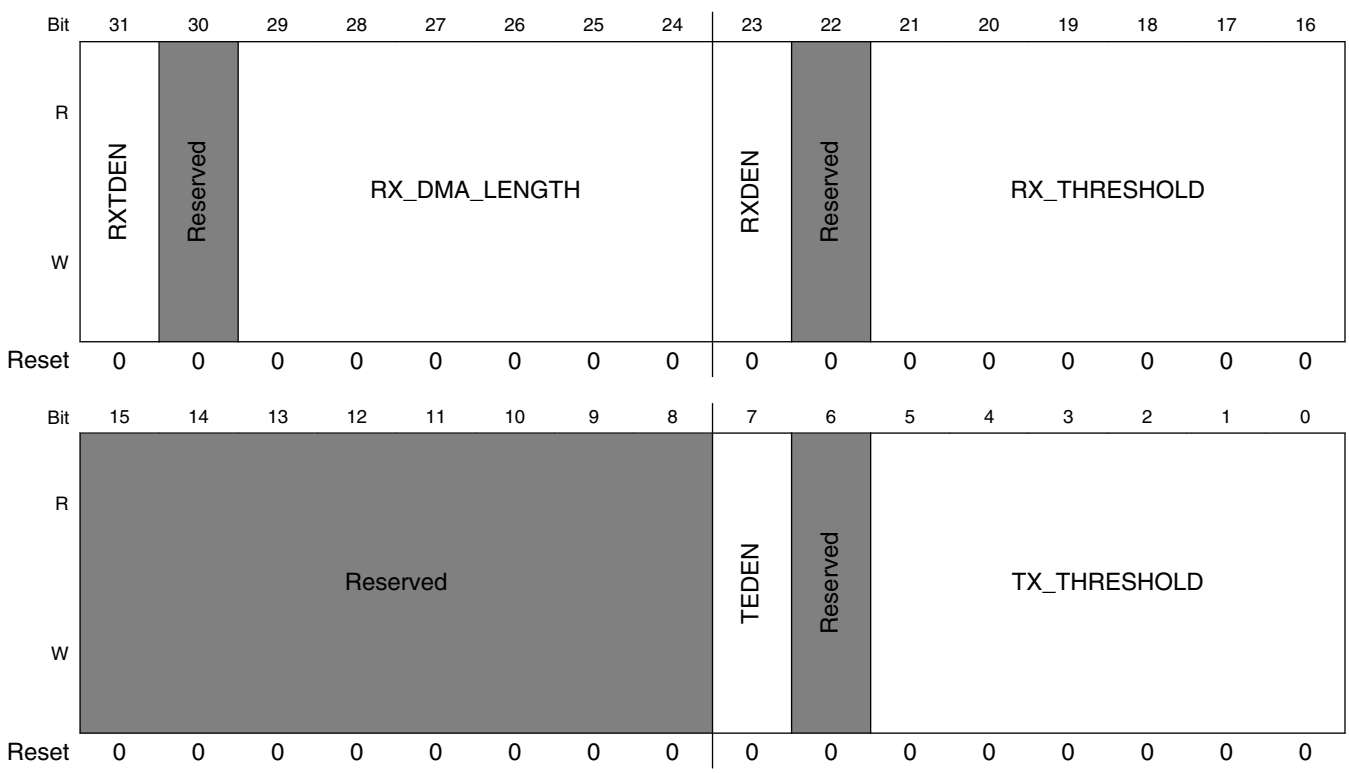
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_INTREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

ECSPIx_INTREG field descriptions (continued)



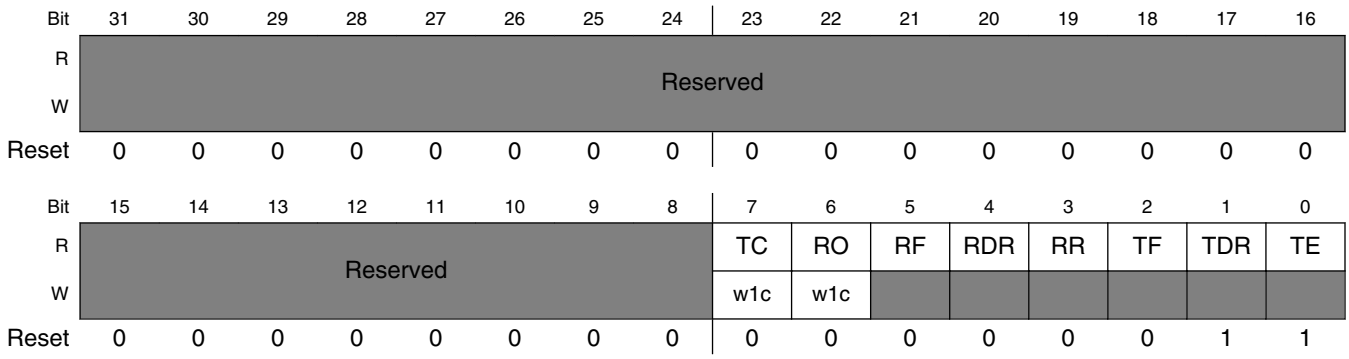
Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

21.7.6 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset



ECSPIx_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request/Interrupt Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request/ interrupt is generated even if it is less than or equal to RX_THRESHOLD. 0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_ LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request. 0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_ THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request. 0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_ THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is not greater than TX_THRESHOLD.

21.7.7 Status Register (ECSPIx_STATREG)

The ECSPI Status Register (ECSPI_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000_0003.

Address: Base address + 18h offset

ECSPIx_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it. **NOTE:** The TC bit does not provide a reliable indication that the transfer is complete. Under some conditions, the TC interrupt can occur before the transfer is completed. If the TC bit is used as an interrupt source, the XCH bit should be polled after the TC interrupt occurs to accurately confirm that the transfer is complete. 0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it. 0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full. 0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request. 0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.

Table continues on the next page...

ECSPIx_STATREG field descriptions (continued)

Field	Description
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO. 0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full. 0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of valid data slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of valid data slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

21.7.8 Sample Period Control Register (ECSPIx_PERIODREG)

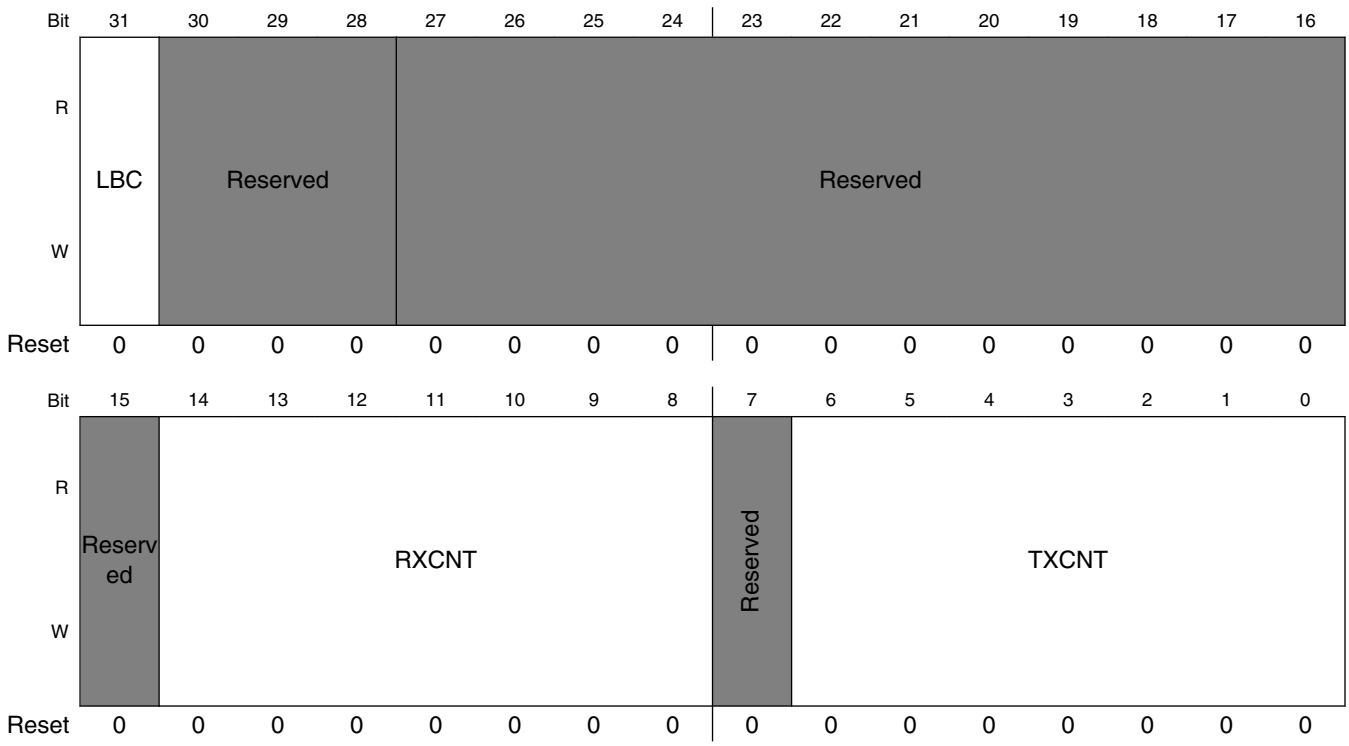
The Sample Period Control Register (ECSPI_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPI_CONREG[CHANNEL MODE] = 1).ECSPI_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved										CSD_CTL					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CSRC	SAMPLE_PERIOD														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



ECSPIx_PERIODREG field descriptions

Field	Description
31–22 -	This field is reserved. Reserved
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPI_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted ... ... 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

21.7.9 Test Control Register (ECSPIx_TESTREG)

The Test Control Register (ECSPI_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPIx_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins continue to operate normally, however the input pins are ignored. 0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

Table continues on the next page...

ECSPIx_TESTREG field descriptions (continued)

Field	Description
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

21.7.10 Message Data Register (ECSPIx_MSGDATA)

The Message Data Register (ECSPI_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reading from this register returns zero, and writing to this register stores data in the MSG Data FIFO.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	ECSPI_MSGDATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_MSGDATA field descriptions

Field	Description
ECSPI_ MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

Chapter 22
External Interface Module (EIM)

22.1 Overview

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

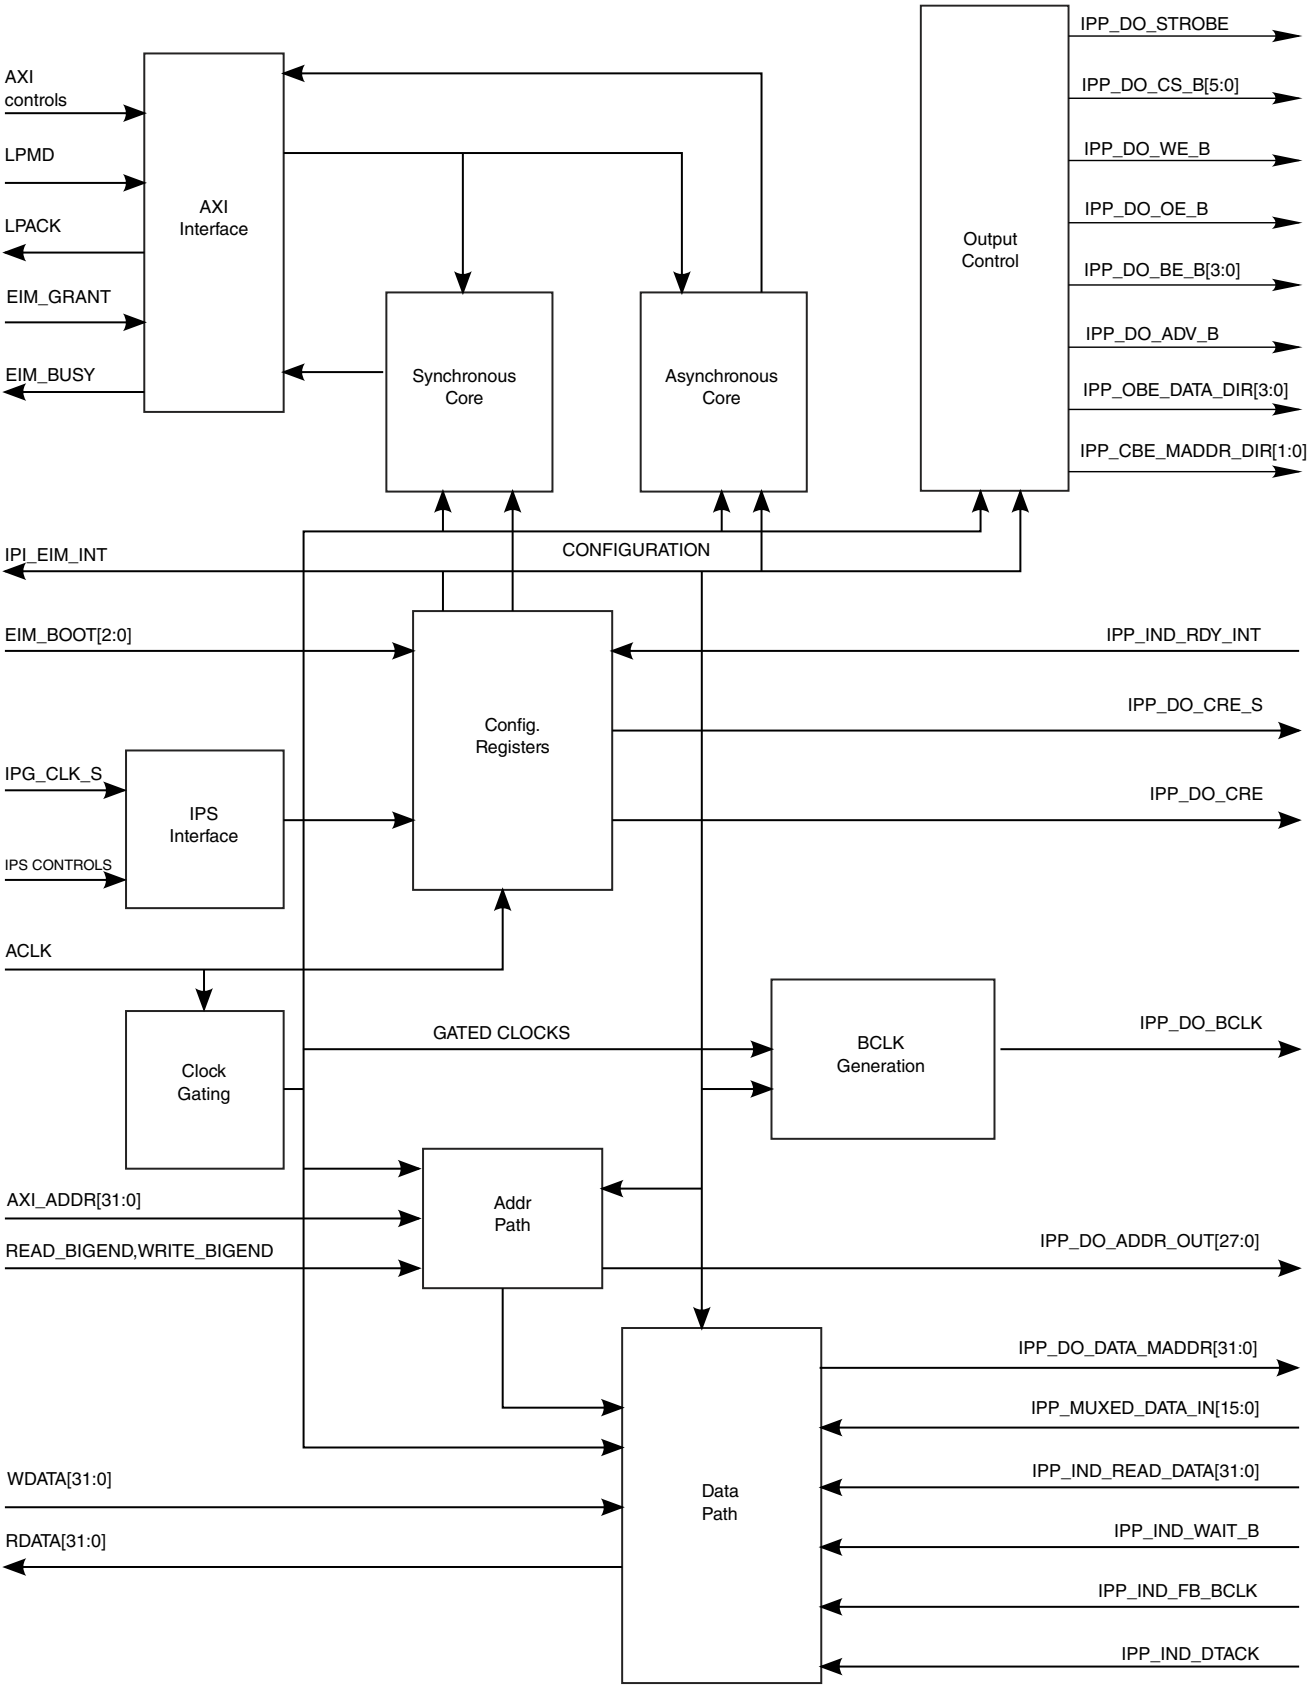


Figure 22-1. EIM Diagram

22.1.1 Features

- Four chip selects for external devices
  - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see Chip Select Memory Map). Configurable Chip Select 0 base address (by VIA)
  - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32 MBytes.
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 and x32 port size
- Programmable Data Port Size for each Chip Select (x8, x16 and x32)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 and x32 port size)
- Support continuous Burst Clock which can be used as reference clock for FPGA
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- Arm AXI slave interface. One ID at a time support.
- External Interrupt support, RDY_INT signal function as external interrupt
- Boot from external device support according to boot signals, using RDY_INT signal
  - RDY signal support assertion after reset for MDOC™ (M-Systems) device
  - INT signal support assertion after reset for OneNAND™ (Samsung) device

22.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode

- Multiplexed Address/Data mode
- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the EIM Operational Modes.

22.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

22.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

22.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16/x32 data width memory devices.

For more information about the pins that drive data/address in 8/16/32 non-muxed mode and 16/32 muxed mode, see the following table.

Table 22-1. EIM multiplexing

Setup	Non Multiplexed Address/Data Mode							Multiplexed Address/ Data mode	
	8 Bit				16 Bit		32 Bit	16 Bit	32 Bit
	MUM = 0, DSZ = 100	MUM = 0, DSZ = 101	MUM = 0, DSZ = 110	MUM = 0, DSZ = 111	MUM = 0, DSZ = 001	MUM = 0, DSZ = 010	MUM = 0, DSZ = 011	MUM = 1, DSZ = 001	MUM = 1, DSZ = 011
A[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]

D[15:8], EIM_EB1	-	EIM_D[15:8]	-	-	EIM_D[15:8]	-	EIM_D[15:8]	EIM_DA[15:8]	EIM_DA[15:8]
D[23:16], EIM_EB2	-	-	EIM_D[23:16]	-	-	EIM_D[23:16]	EIM_D[23:16]	-	EIM_D[7:0]
D[31:24], EIM_EB3	-	-	-	EIM_D[31:24]	-	EIM_D[31:24]	EIM_D[31:24]	-	EIM_D[15:8]

22.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/ PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

NOTE

Maximum frequency of the EIM main clock is 133 MHz. It may be reduced by the system for special cases of external

devices, which demand a different frequency then integer division of the 133 MHz clock.

22.1.2.5 Low Power Modes

The input clock is gated by ACT_CS bits. When all the ACT_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

22.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See System Boot for more details.

22.2 External Signals

The following table describes the external signals of EIM:

Table 22-2. EIM External Signals

Signal	Description	Pad	Mode	Direction
EIM_ACLK_FREERUN	AXI clock signal	EIM_A25	ALT9	I
		EIM_D31	ALT9

EIM_DATA19	MSB Data Bus signal	EIM_D19	ALT0	IO
EIM_DATA20	MSB Data Bus signal	EIM_D20	ALT0	IO

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

Signal	Description	Pad	Mode	Direction
EIM_DATA21	MSB Data Bus signal	EIM_D21	ALT0	IO
EIM_DATA22	MSB Data Bus signal	EIM_D22	ALT0	IO
EIM_DATA23	MSB Data Bus signal	EIM_D23	ALT0	IO
EIM_DATA24	MSB Data Bus signal	EIM_D24	ALT0	IO
EIM_DATA25	MSB Data Bus signal	EIM_D25	ALT0	IO
EIM_DATA26	MSB Data Bus signal	EIM_D26	ALT0	IO
EIM_DATA27	MSB Data Bus signal	EIM_D27	ALT0	IO
EIM_DATA28	MSB Data Bus signal	EIM_D28	ALT0	IO
EIM_DATA29	MSB Data Bus signal	EIM_D29	ALT0	IO
EIM_DATA30	MSB Data Bus signal	EIM_D30	ALT0	IO
EIM_DATA31	MSB Data Bus signal	EIM_D31	ALT0	IO
EIM_DTACK_B	Data Acknowledge, asynchronous access. This input is used as a data acknowledge signal for single asynchronous accesses.	EIM_WAIT	ALT1	I
EIM_EB0	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only. EIM_EB[0] corresponds to DATA_OUT[7:0] For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB0	ALT0	O
EIM_EB1	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only. EIM_EB[1] corresponds to DATA_OUT[15:8] For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB1	ALT0	O

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

Signal	Description	Pad	Mode	Direction
EIM_EB2	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only. EIM_EB[2] corresponds to DATA_OUT[23:16] For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB2	ALT0	O
EIM_EB3	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only. EIM_EB[3] corresponds to DATA_OUT[31:24]. For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB3	ALT0	O
EIM_LBA	Address Valid. This active-low output signal is asserted during burst mode accesses to cause the external burst capable device to load a new starting burst address. Assertion of LBA indicates that a valid address is present on the address bus. Its behavior is affected by the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1 registers, the RADVA and RADVN fields of the EIM_CSxRCR1 registers, and the WADVA and WADVN fields of the EIM_CSxWCR1 registers. In asynchronous mode, LBA length is affected by the RADVA, WADVA, RADVN, and WADVN fields. Minimum length of LBA signal in all modes is one EIM clock cycle.	EIM_LBA	ALT0	O

Table continues on the next page...

Table 22-2. EIM External Signals (continued)

Signal	Description	Pad	Mode	Direction
EIM_OE	Output Enable. This active-low output signal indicates the bus access is a read and enables external devices to drive the data bus with read data. Its behavior is affected by the OEA and OEN bit fields in the Chip Select Configuration Registers.	EIM_OE	ALT0	O
EIM_RW	Memory Write Enable. This active-low output signal indicates the bus access is a write and enables external devices to sample the data bus. Its behavior is affected by the WEA and WEN bit fields in the Chip Select Configuration Registers.	EIM_RW	ALT0	O
EIM_WAIT	Ready/Busy/Wait signal. This active-low input signal is asserted by external burst capable devices which support fixed or variable latency of data. It is serviced in synchronous mode only (EIM_CSxGCR1[SWR, SRD] =1). WAIT will have a pull up resistor in pad. The signal indicates whether the External device is ready for data transaction or not. Busy cycles (or wait cycles) of the external device can occur at the start of a Burst access or at page boundary crossover. **NOTE:** For burst devices, WAIT output should be configured to change one cycle before data is ready (before delay). **NOTE:** Some External devices may not use this input signal for ready state indication (fix latency without WAIT signal monitoring). For these devices EIM should be configured accordingly (see RFL, WFL, and PSZ field descriptions). **NOTE:** This is same as what is shown in IP_IND_WAIT_B	EIM_WAIT	ALT0	I

22.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals internal to the chip that are important in understanding the function of EIM.

Table 22-3. EIM Important Internal Signals

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM. A more detailed description can be found in Boot Fusemap.
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

22.3 Clocks

The following table describes the clock sources for EIM. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 22-4. EIM Clocks

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- ACLK: EIM clock (main clock, AXI clock) with a Max frequency of 133 MHz. Can be gated externally when there is no active AXI access.
- ACLK_SLOW: EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- IPG_CLK_S: IPG clock for IP accesses. IP registers are activated by ACLK_SLOW clock.
- ACLK_EXSC: Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

22.4 Chip Select Memory Map

The EIM memory space is mapped into 128 MB total memory space in the processor memory. For addresses, see the System memory map table and the CM4 memory map table. The total 128 MB of memory can be divided among the EIM four chip selects. The memory configuration across the chip selects is controlled by the IOMUXC_GPR1 register. The ADDRSn[10] fields control how much memory is allotted to each chip select.

The following four configurations are supported:

- CS0 (128 MB), CS1 (0 MB), CS2 (0 MB), CS3 (0 MB) [default configuration]
- CS0 (64 MB), CS1 (64 MB), CS2 (0 MB), CS3 (0 MB)
- CS0 (64 MB), CS1 (32 MB), CS2 (32 MB), CS3 (0 MB)
- CS0 (32 MB), CS1 (32 MB), CS2 (32 MB), CS3 (32 MB)

22.5 Functional Description

This section provides the functional description for the EIM.

22.5.1 Continuous BCLK

EIM module can be programmed to provide a continuous BCLK in synchronous mode as the reference clock of PPGA. In this case, an internal DLL(Delay-locked Loop) is used to synchronize the internal clock which is used to sample read data from the I/O pad, with the feedback BCLK from PAD. The DLL compares the phase difference of internal clock to the feedback BCLK and will lock up when the delay of Reference Delay Line equals to the phase difference. After the lock up of Reference Delay Chain , DLL will copy the Master Delay Chain's value to Slave Delay Chain automatically. The Slave Delay Chain is used to delay the internal clock. If continuous BCLK is not selected, DLL should not be enabled.

When using an continuous BCLK in synchronous mode, BCD MUST be set to 0, otherwise will cause malfunction of EIM.

To let EIM work properly under continuous BCLK MODE, the initialization must follow below procedure. The initialize procedure should be done before any access to EIM. If it is not possible to do so, e.g. device booted up from EIM, the initialize flow should be done after performming a reset of EIM.

The recommended initialize flow is as follow

1. Disable EIM clock by clearing bit 4 of EIM_WIAR Register.
2. Select Continuous BCLK by setting bit 3 of EIM_WCR Register.
3. Enable DLL by setting bit 0 of EIM_DCR Register.
4. Enable EIM clock by setting bit 4 of EIM_WIAR Register.
5. Reset DLL by toggling bit 1 of EIM_DCR Register(1->0->1).
6. Wait for DLL lock (Both bit 0 and bit 1 of EIM_DSR Register are asserted).

After initialization, EIM can be programed to various access timing, but BCD MUST be kept to 0.

DLL Upadte Interval and inital value can be set by write EIM_DCR Register in corresponding bit field.

Also DLL provides manual adjustment to delay. An extra offset can be added to internal delay line, which can be used when DLL have some kind of predicable error. OVERRIDE bit field of EIM_DCR register will override reference DLL locked value and use a direct value for delay.

Note: During initialization, BCLK frequence and duty cycle are not guaranteed.

22.5.2 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

22.5.2.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

22.5.2.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (Arm platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

22.5.2.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

22.5.3 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

Table 22-5. EIM Operation Modes Field Settings

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
1	0	0	Asynchronous write/read multiplexed
		1	Synchronous write/ Asynchronous read multiplexed
	1	0	Asynchronous write/Synchronous read multiplexed
		1	Synchronous write/read multiplexed

22.5.4 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts $\overline{\text{ADV}}$, causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

NOTE

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

22.5.5 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected; $\overline{\text{ADV}}$ and BCLK. The $\overline{\text{ADV}}$ signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

22.5.6 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1 and Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0 for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

22.5.7 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

22.5.8 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional $\overline{\text{ADV}}$ signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating $\overline{\text{ADV}}$ signal.

22.5.9 AXI (Master) Bus Cycles Support

The EIM uses an Arm AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.
- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case Arm cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See Table 22-7.

Table 22-6. AXI Burst Cycles Supported

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer

Table continues on the next page...

Table 22-6. AXI Burst Cycles Supported (continued)

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

Table 22-7. AXI to Memory Burst Splits Number

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8 Memory Port size	# of accesses to X16 Memory Port size	# of accesses to X32 Memory Port size
INC16 Aligned Addr.	WRAP4	16	8	4
	Cont.	1	1	1

Table continues on the next page...

Table 22-7. AXI to Memory Burst Splits Number (continued)

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8 Memory Port size	# of accesses to X16 Memory Port size	# of accesses to X32 Memory Port size
Unaligned Addr.	WRAP16	2 or 3	2	1 or 2
WRAP8	WRAP16	2	1	1
Aligned Addr.	Cont.	1	1	1
WRAP8 Unaligned Addr.	WRAP16	2 or 3	1	2
	Cont.	2	2	2

22.5.10 WAIT_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

22.5.11 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

22.5.12 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

22.5.13 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the wdog_limit (according to the WDOG_LIMIT bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In dtack access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the wdog_limit before the device asserts the dtack signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can by disabled by WDOG_EN bit in the WCR.

22.5.14 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
  - Access to a disabled chip select - access to a mapped chip select address space where the CSEN bit in the corresponding chip select Configuration Register is clear
  - Access to a non mapped address - access to an address that is not mapped to any CS.
  - User access to a supervisor-protected chip select address space (the SP bit in the corresponding chip select Configuration Register is set)
  - User access in fixed mode access
  - User performs write access to write protected chip select
  - First write data ID and write address ID do not match. (No data is written to the memory.)

    - First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
    - Access duration to external device from CSx signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled be software.
- IPS errors
    - User read or write access to a reserved/non-valid address in the EIM Configuration Register

22.5.15 DTACK Mode

In DTACK mode, the EIM uses DTACK signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see Figure 22-15, Figure 22-16 & Figure 22-17).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see Figure 22-19).

22.5.16 RDY_INT Signal as Interrupt

The EIM has an external interrupt support. When INTEN bit in the WCR is set, signal RDY_INT is used as interrupt; its status is being reflected by INT bit and output signal.

It is cleared by writing one to the INT bit. When INTEN is cleared, the interrupt is disabled. This interrupt is a level interrupt and its polarity can be configured by the INTPOL bit in the WCR.

22.5.17 RDY_INT Signal as Ready After Reset Indication

This feature is used for boot propose from external devices based on NANDFlash array memory with NORFlash interface.

When ERRST bit is set, RDY_INT signal is monitored to determine ready after reset of the external device located on CS0.

The monitoring is taking place when CS0 is accessed for the first time. The access will be pending until assertion of the signal is detected. When detection occurs, ERRST bit is self-cleared and pending access is executed to the external device on CS0.

22.5.18 EIM_GRANT / EIM_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM_BUSY signal (1'b1) and checks the EIM_GRANT signal status.

If EIM_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM_BUSY signal set until it completes the access toward the external device.

Once EIM_GRANT signal is set, it can not be reset until EIM_BUSY signal is cleared by EIM.

NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM_GRANT signal from NFC and doesn't assert the EIM_BUSY signal.

22.5.19 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

22.5.20 Endianness

Big and Little endianness are supported by the controller according to the following table.

Table 22-8. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port			Byte port	
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
							1	0xB1	0xB0	2	0xB1
										3	0xB0
	Half Word	0			0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
		2	0xB3	0xB2			1	0xB1	0xB0	2	0xB1
										3	0xB0
	Byte	0				0xB0	0		0xB3	0	0xB3
		1			0xB1			0xB2		1	0xB2
		2		0xB2			1		0xB1	2	0xB1
		3	0xB3					0xB0		3	0xB0
Little	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB1	0xB0	0	0xB0
										1	0xB1
							1	0xB3	0xB2	2	0xB2
										3	0xB3
	Half Word	0			0xB1	0xB0	0	0xB1	0xB0	0	0xB0
										1	0xB1
		2	0xB3	0xB2			1	0xB3	0xB2	2	0xB2
										3	0xB3
	Byte	0				0xB0	0		0xB0	0	0xB0
		1			0xB1			0xB1		1	0xB1
		2		0xB2			1		0xB2	2	0xB2
		3	0xB3					0xB3		3	0xB3

22.5.21 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

22.6 Initialization Information

22.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM_BOOT [2:0] block inputs.

22.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR_I(address, data, delta, counter) is a write data sequence, there data(i+1) = data(i) + delta
- COMMAND_SEQUENCE
- CHECK_STATUS

NOTE

COMMAND_SEQUENCE and CHECK_STATUS are described in AMD Flash Utility, Intel Sibley Flash Utility, MDOC Device Utility, Samsung OneNAND Utility, and Spansion Flash Utility.

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM_" is a prefix of EIM's registers. 'h is a prefix of hexadecimal constant. "//" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verfied with the memory models listed below and may require some adjustments for other family members.

22.7.1 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

22.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM_CS0GCR1,'h00210081);
- WR32('EIM_CS0RCR1,'h0e020000);
- WR32('EIM_CS0RCR2,'h00000000);
- WR32('EIM_CS0WCR1,'h0704a040);

22.7.1.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
     WR16('CS0+('h5903<<1),'h0060);
     WR16('CS0+('h5903<<1),'h0003);
     WR16('CS0+('h0000<<1),'h00ff);
// Set EIM configuration to synchronous timing
     WR32('EIM_CS0GCR1,'h50214225);                    // 133 MHz
     WR32('EIM_CS0RCR1,'h0c000000);                    // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
     WR16('CS0+('h3103<<1),'h0060);
     WR16('CS0+('h3103<<1),'h0003);
     WR16('CS0+('h0000<<1),'h00ff);
//-------------------------------------------------------------------------
// Set EIM configuration to synchronous timing
     WR32('EIM_CS0GCR1,'h5021122d);                    // 66 MHz
     WR32('EIM_CS0RCR1,'h07000000);                    // 7cycles on memory
```

22.7.1.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
     WR16('CS0+addr,'h0060);                 // Unlock
     WR16('CS0+addr,'h00d0);
     WR16('CS0+addr, 'h0041);
     WR16('CS0+addr, data);
     WR16('CS0+caddr, 'h0070);                 // Read Status command
     while('CS0+data[7] == 0)                                  // Wait / Polling
         RD16('CS0+addr, data);              // Read status
     RD16('CS0+addr, data);                  // Read status
     WR16('CS0+'h0000,'h00ff);
// Write buffer programming
     WR16('CS0+addr,'h0060);                 // Unlock
     WR16('CS0+addr,'h00d0);
     data    = 0;
     WR16('CS0+addr, 'h0070);                // Read Status command
     while(data[7] == 0)                             // Wait
         RD16('CS0+addr, data);              // Read status
     WR16('CS0+'h0000,'h00ff);
     WR16('CS0+addr,'h00e9);           // Write Buffer command
     WR16('CS0+addr,255);              // Word counter (<256)
     for(i=0; i<'h200; i = i + 'h40)
        WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
     WR16('CS0+addr,'h00d0);           // Write Confirm command
     data  = 0;
     while(data[7] == 0)                      // Wait
        RD16('CS0+addr, data);         // Read status
     RD16('CS0+addr, data);            // Read status
     WR16('CS0+'h0000,'h00ff);
```

22.7.2 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

22.7.2.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

22.7.2.2 MDOC Device Asynchronous Mode Configuration

```
// Non-muxed mode
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0e121010);

WR32('EIM_CS0RCR1,'h0e121010);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h12092492);
```

22.7.2.3 MDOC Device Utility

```
// Read Manufacturer ID and Device ID
    RE16('CS0+'h9400,'h4833);
    RE16('CS0+'h9422,'hb7cc);
```

22.7.3 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb_706.

22.7.3.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
    WR32('EIM_CS0GCR1,'h403104b1);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h0b040040);
// 32 bit memory
    WR32('EIM_CS0GCR1,'h403304b1);
    WR32('EIM_CS0RCR1,'h0f010000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h0f040040);
```

22.7.3.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
    WR32('EIM_CS0GCR1,'h403104b1);
    WR32('EIM_CS0WCR1,'h0b040000);
    WR16('CS0+('h85947<<1),'h0040); // memory configuration
    WR32('EIM_CS0GCR1,'h4021_5487);// fixed latency memory wrap 4
    WR32('EIM_CS0RCR1,'h04000000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h04000000);
// 32 bit memory
    WR32('EIM_CS0GCR1,'h6003_04f1);
    WR32('EIM_CS0WCR1,'h0b04_0000);
    WR32('CS0+('h85947<<2),'h0040); // memory configuration
    WR32('EIM_CS0GCR1,'h4003_1487); // var latency memory inc. page size 128
    WR32('EIM_CS0RCR1,'h04000000);
    WR32('EIM_CS0RCR2,'h00000008);
    WR32('EIM_CS0WCR1,'h04000000);
```

22.7.4 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

22.7.4.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]
- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

22.7.4.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
    WR32('EIM_CS0GCR1,'h00410081);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000000);
    WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
    WR32('EIM_CS0GCR1,'h00410089);
    WR32('EIM_CS0RCR1,'h0b010000);
    WR32('EIM_CS0RCR2,'h00000000);
    WR32('EIM_CS0WCR1,'h0c092480);
```

22.7.4.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
    WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
    WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
    WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
    WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
    WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
    WR32('EIM_CS0RCR1,'h05010000);
    WR32('EIM_CS0WCR1,'h05040000);
```

22.7.4.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
    WR16('CS0+('hF100<<1),'h0);        // DFS
    WR16('CS0+('hF100<<1),'h0);        // DBS
    WR16('CS0+('hF24c<<1),'h2);        // SBA - block number (2)
    WR16('CS0+('hF241<<1),'h0);        // Clear interrupt status
    WR16('CS0+('hF220<<1),'h23);       // Unlock command
    data ='h0;
    while(!(data &'h0004))             // Polling
       RD32('WIAR, data); // Read status
// Erase block command
    WR16('CS0+('hF100<<1),'h2);        // DFS and block ([8:0]) address
    WR16('CS0+('hF101<<1),'h0);        // DBS
    WR16('CS0+('hF241<<1),'h0);        // Clear interrupt status
              WR16('CS0+('hF220<<1),'h94);            // Erase command
    data ='h0;
    while(!(data &'h0004))                    // Wait
        RD32('WIAR, data); // Read status
// Program page command
    WR16('CS0+('hF100<<1),'h2);             // DFS and block[8:0] address
    WR16('CS0+('hF107<<1),'h0);             // sector[1:0] and page[7:2] addresses
    WR16('CS0+('hF200<<1),'h800);           // buffer[11:8] address and counter[1:0]
    WR16('CS0+('hF241<<1),'h0);             // Clear interrupt status
    WR16('CS0+('hF220<<1),'h80);            // Program command
    data ='h0;
    while(!(data &'h0004))                  // Wait
        RD32('WIAR, data); // Read status
```

22.7.5 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

22.7.5.1 Samsung UtRAM Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1,'h400104b1);
WR32('EIM_CS0RCR1,'h0a010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0b040040);
```

22.7.5.2 Samsung UtRAM Synchronous Mode Configuration

```
RD16('CS0+('hff_ffff<<1),data);             // command sequence
RD16('CS0+('hff_ffff<<1),data);
RD16('CS0+('hff_ffff<<1),data);
RD16('CS0+('hff_feff<<1),data);
RD16('CS0+('h00_82a0<<1),data);             // memory sync. configuration
WR32('EIM_CS0GCR1,'h4021_53b7);            // fixed latency memory wrap 32
WR32('EIM_CS0RCR1,'h0500_0000);
WR32('EIM_CS0WCR1,'h0300_0000);
```

22.7.6 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

22.7.6.1 Spansion Flash Asynchronous Mode Configuration

```
           WR32('EIM_CS0GCR1,'h00410081);
           WR32('EIM_CS0RCR1,'h0a018000);
           WR32('EIM_CS0RCR2,'h00000000);
           WR32('EIM_CS0WCR1,'h0704a240);
WR16('CS0+('hF220<<1),'h94);            // Erase command
           data ='h0;
           while(!(data &'h0004))                   // Wait
               RD32('WIAR, data); // Read status
      // Program page command
           WR16('CS0+('hF100<<1),'h2);              // DFS and block[8:0] address
           WR16('CS0+('hF107<<1),'h0);              // sector[1:0] and page[7:2] addresses
           WR16('CS0+('hF200<<1),'h800);            // buffer[11:8] address and counter[1:0]
           WR16('CS0+('hF241<<1),'h0);              // Clear interrupt status
           WR16('CS0+('hF220<<1),'h80);             // Program command
           data ='h0;
           while(!(data &'h0004))                   // Wait
               RD32('WIAR, data); // Read status
```

22.7.6.2 Spansion Flash Synchronous Mode Configuration

```
           WR16('CS0+('h0555<<1),'h00aa);   // command sequence
           WR16('CS0+('h02aa<<1),'h0055);
           WR16('CS0+('h0555<<1),'hd0);
           WR16('CS0+('h0000<<1),'h1ec4);   // memory sync. configuration
           WR32('EIM_CS0GCR1,'h50411325); // 66 MHz
           WR32('EIM_CS0RCR1,'h05000000); // 5 cycles on memory
```

22.7.6.3 Spansion Flash Utility

```
       // Single word programming
           COMMAND_SEQUENCE(cs,16,'ha0);            // single word programming
           WR16('CS0+addr, data);
           CHECK_STATUS('CS0+addr,data,16,1,errst);
       // Write buffer programming
           COMMAND_SEQUENCE(0,16,'h25);               // write buffer programming
           WR16('CS0+addr,'h001f);                      // counter-1
           WR_I('CS0+addr, data, 'h0010_0001, 16); // data
           WR16('CS0+addr,'h0029);                       // write buffer to flash
           CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);
```

There COMMAND_SEQUENCE and CHECK_STATUS are next functions:

```
       task COMMAND_SEQUENCE;
           input[2:0]    cs;
           input[7:0]    port_size;
           input[31:0]   code;
       begin
           if(port_size == 16)
              begin
              WR16(csba[cs]+('h0555<<1),'h00aa);
              WR16(csba[cs]+('h02aa<<1),'h0055);
              WR16(csba[cs]+('h0555<<1),code);
              end
           else
              begin
              WR32(csba[cs]+('h0555<<2),'h00aa);
```

```
             WR32(csba[cs]+('h02aa<<2),'h0055);
             WR32(csba[cs]+('h0555<<2),code);
             end
       end
       endtask
       task     CHECK_STATUS;
           input[31:0] addr;
           input[31:0] edata;
           input[7:0]   port_size;
           input[7:0]   opcode;
           output[7:0] errst;
           reg[31:0]    data;
           reg[31:0]    data3;
       begin
           errst = 0;
           data  = 0;
           data3 = 0;
while(!(data == edata) && !errst) // Wait operation
         begin: BR_EN
         RD16(addr, data);             // Read status
         if(data[7] !== edata[7])
             begin
             if(data[5] == 1)
                  begin
                  RD16(addr, data3);
                  RD16(addr, data);
                  if(data[6] !== data3[6])
                       begin
                       $display("CHECK_STATUS: Error timout on single data program");
                       errst = 1;
                       disable BR_EN;
                       end
                  end
             else
                  begin
                  if(opcode == 2)
                       if(data[1] == 1)
                           begin
                           RD16(addr, data3);
                           if(port_size == 32)
                              RD32(addr, data);
                           else
                              RD16(addr, data);
                           if(data[1] == 1 && data !== edata)
                              begin
                              $display("CHECK_STATUS: Error on write buffer");
                              errst =3;
                              disable BR_EN;
                              end
                           end
                  end
             end
         else
             begin
             RD16(addr, data3);
             if(port_size == 32)
                  RD32(addr, data);
             else
                  begin
                  RD16(addr, data);
                  edata[31:16] = 16'h0;
                  end
             if(data !== edata)
                  begin
                  $display("CHECK_STATUS: Error in data write on single data program");
                  errst =2;
                  disable BR_EN;
                  end
             end
         end
```

```
end
endtask
```

22.7.7 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

Table 22-9. Intel Mode pin connections

Arm platform Pin	EIM Pin	Notes
ADS#	IPP_DO_ADV_B	WAL = 1,RAL = 1
W/R	IPP_DO_BE_B	WBED = 1
WR#	WE#	
RD#	OE#	

Mot. Mode - For intel mode use the following connection:

22.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM_CSnRCR2)
- Chip Select n Write Configuration Register (EIM_CSnWCR)

In addition there are 3 general registers: EIM_WCR, EIM_WIAR, and EIM_EAR.

NOTE

- All EIM registers are sampled by IPG_CLK_S, therefore IPG_CLK_S must be active when accessing through IP bus.
- Read access from all registers (except EIM_WIAR and EIM_EAR) will generate one IPG_XFR_WAIT cycle.
- Read access from EIM_WIAR and EIM_EAR will generate six IPG_XFR_WAIT cycles.
- Write access to all registers (except EIM_EAR) will generate three IPG_XFR_WAIT cycles.
- Write access to EIM_EAR will generate six IPG_XFR_WAIT cycles.

EIM_CS*n*GCR1 field descriptions

Field	Description
31–28 PSZ	Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately. It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset. 0000 8 words page size 0001 16 words page size 0010 32 words page size 0011 64 words page size 0100 128 words page size 0101 256 words page size 0110 512 words page size 0111 1024 (1k) words page size 1000 2048 (2k) words page size 1001 - 1111 Reserved
27 WP	Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset. 0 Writes are allowed in the memory range defined by chip. 1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.
26–24 GBC	Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	Example settings: 000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only) 001 minimum of 1 EIM clock cycles before next access from different chip select 010 minimum of 2 EIM clock cycles before next access from different chip select 111 minimum of 7 EIM clock cycles before next access from different chip select
23 AUS	Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset. 0 Address shifted according to port size (DSZ config) (128 Mbyte maximum supported memory density). 1 Address unshifted (32 Mbyte maximum supported memory density).
22–20 CSREC	CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000. Example settings: 000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only) 001 1 EIM clock cycles minimum width of CS, OE and WE signals 010 2 EIM clock cycles minimum width of CS, OE and WE signals 111 7 EIM clock cycles minimum width of CS, OE and WE signals
19 SP	Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset. 0 User mode accesses are allowed in the memory range defined by chip select. 1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.
18–16 DSZ	Data Port Size. This bit field defines the width of an external device's data port as shown below. **NOTE:** Only async. access supported for 8 bit port. **NOTE:** The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001. 000 Reserved. 001 16 bit port resides on DATA[15:0] 010 16 bit port resides on DATA[31:16] 011 32 bit port resides on DATA[31:0] 100 8 bit port resides on DATA[7:0] 101 8 bit port resides on DATA[15:8] 110 8 bit port resides on DATA[23:16] 111 8 bit port resides on DATA[31:24]
15–14 BCS	Burst Clock Start. When SRD=1 or SWR=1,this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated. When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset. 00 0 EIM clock cycle additional delay

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay
13–12 BCD	Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset. **NOTE:** For other then the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
11 WC	Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset. 0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous.
10–8 BL	Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size, type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access. BL is cleared by a hardware reset. When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1. 000 4 words Memory wrap burst length (read page burst size when APR = 1) 001 8 words Memory wrap burst length (read page burst size when APR = 1) 010 16 words Memory wrap burst length (read page burst size when APR = 1) 011 32 words Memory wrap burst length (read page burst size when APR = 1) 100 Continuous burst length (2 words read page burst size when APR = 1) 101 Reserved 110 Reserved 111 Reserved
7 CREP	Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset. **NOTE:** Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled. For Non-PSRAM memory CREP value should be 1. 0 CRE signal is active low 1 CRE signal is active high
6 CRE	Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.

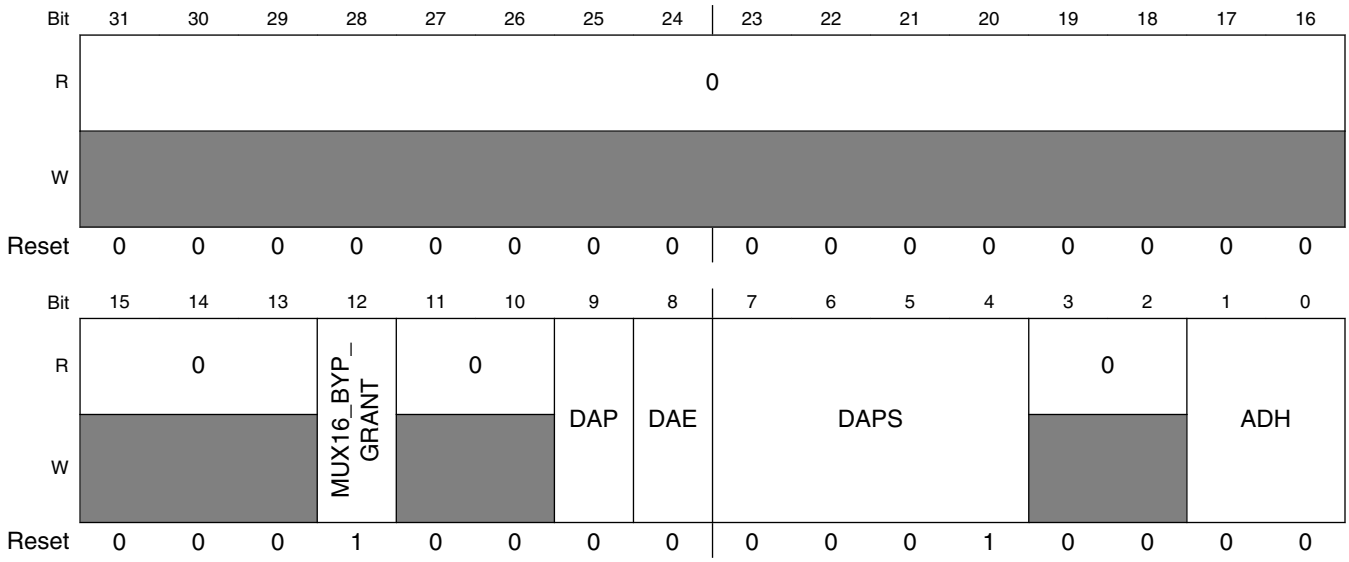

Table continues on the next page...

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	0 CRE signal use is disable 1 CRE signal use is enable
5 RFL	Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset. When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device. 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
4 WFL	Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset. When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device 0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
3 MUM	Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent). **NOTE:** The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0. 0 Multiplexed Mode disable 1 Multiplexed Mode enable
2 SRD	Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset. **NOTE:** Sync. accesses supported only for 16/32 bit port. 0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode
1 SWR	Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset. **NOTE:** Sync. accesses supported only for 16/32 bit port. 0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode
0 CSEN	CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5. **NOTE:** Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0. 0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.

22.9.2 Chip Select n General Configuration Register 2 (EIM_CS*n*GCR2)

Address: 21B_8000h base + 4h offset + (24d × i), where i=0d to 3d

EIM_CS*n*GCR2 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses.

Table continues on the next page...

EIM_CS*n*GCR2 field descriptions (continued)

Field	Description
	NOTE: Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access. DAPS is cleared by a hardware reset. Example settings: 0000 3 EIM clk cycle between start of access and first $\overline{\text{DTACK}}$ check 0001 4 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 0010 5 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 0111 10 EIM clk cycles between start of access and first $\overline{\text{DTACK}}$ check 1011 14 EIM clk cycles between start of access and first DTACK check 1111 18 EIM clk cycles between start of access and first DTACK check
3–2 Reserved	This read-only field is reserved and always has the value 0.
ADH	Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode). When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched. **NOTE:** Reset value for EIM_CS0GCR2 for ADH is 0b10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 0b00. 00 0 cycle after ADV negation 01 1 cycle after ADV negation 10 2 cycle after ADV negation 11 Reserved

22.9.3 Chip Select n Read Configuration Register 1 (EIM_CS*n*RCR1)

Address: 21B_8000h base + 8h offset + (24d × i), where i=0d to 3d

EIM_CS*n*RCR1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

Field	Description
29–24 RWSC	Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select. When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data.Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode. When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode. When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer. RWSC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000. Example settings: 000000 Reserved 000001 RWSC value is 1 000010 RWSC value is 2 111101 RWSC value is 61 111110 RWSC value is 62 111111 RWSC value is 63
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses. When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access. When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0RCR1[RADVN] = 0b010. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000. **NOTE:** This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset. In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH +1) EIM clock cycles from start of access. **NOTE:** The reset value for EIM_CS0RCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RCR1[OEA] is 0b010. The reset value of this field for EIM_CS1RCR1 - EIM_CS5RCR1 is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and OE assertion 001 1 EIM clock cycles between beginning of access and OE assertion 010 2 EIM clock cycles between beginning of access and OE assertion 111 7 EIM clock cycles between beginning of access and OE assertion
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 and APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of access and OE negation 001 1 EIM clock cycles between end of access and OE negation 010 2 EIM clock cycles between end of access and OE negation 111 7 EIM clock cycles between end of access and OE negation
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and CS assertion 001 1 EIM clock cycles between beginning of read access and CS assertion 010 2 EIM clock cycles between beginning of read access and CS assertion 111 7 EIM clock cycles between beginning of read access and CS assertion
3 Reserved	This read-only field is reserved and always has the value 0.
RCSN	Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 and APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

22.9.4 Chip Select n Read Configuration Register 2 (EIM_CS*n*RCR2)

Address: 21B_8000h base + Ch offset + (24d × i), where i=0d to 3d

EIM_CS*n*RCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored. APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. **NOTE:** SRD=0 and MUM=0 must apply when APR=1
14–12 PAT	Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored. PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. 000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units. This field is cleared by a hardware reset. 00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0

Table continues on the next page...

EIM_CS*n*RCR2 field descriptions (continued)

Field	Description
	10 Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0 11 Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RBEA	Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion
3 RBE	Read BE enable. This bit field determines if BE will be asserted during read access. 0 BE are disabled during read access. 1 BE are enable during read access according to value of RBEA and RBEN bit fields.
RBEN	Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 and APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation

22.9.5 Chip Select n Write Configuration Register 1 (EIM_CS*n*WCR1)

Address: 21B_8000h base + 10h offset + (24d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	WAL	WBED	WWSC						WADVA			WADVN			WBEA	
Reset	0	0							0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	WBEA	WBEN			WEA				WEN			WCSA			WCSN	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_CS*n*WCR1 field descriptions

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADVN bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADVN bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses.This bit is cleared by hardware reset.
29–24 WWSC	Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select. When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data.Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode. When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode. When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer. WWSC is cleared by a hardware reset. **NOTE:** The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000. Example settings: 000000 Reserved 000001 WWSC value is 1 000010 WWSC value is 2 000011 WWSC value is 3 111111 WWSC value is 63
23–21 WADVA	ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion
20–18 WADVN	ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses. When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADVN + WADVA + BCD + BCS + 1) EIM clock cycles. When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADVN + WADVA + 1) EIM clock cycles. **NOTE:** Reset value for EIM_CS0WCR for WADVN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. **NOTE:** This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.
17–15 WBEA	BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset.

Table continues on the next page...

EIM_CS*n*WCR1 field descriptions (continued)

Field	Description
	NOTE: Reset value for EIM_CS0WCR for WBEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and BE assertion 001 1 EIM clock cycles between beginning of access and BE assertion 010 2 EIM clock cycles between beginning of access and BE assertion 111 7 EIM clock cycles between beginning of access and BE assertion
14–12 WBEN	BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WBEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between end of access and BE negation 001 1 EIM clock cycles between end of access and BE negation 010 2 EIM clock cycles between end of access and BE negation 111 7 EIM clock cycles between end of access and BE negation
11–9 WEA	WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between beginning of access and WE assertion 001 1 EIM clock cycles between beginning of access and WE assertion 010 2 EIM clock cycles between beginning of access and WE assertion 111 7 EIMclock cycles between beginning of access and WE assertion
8–6 WEN	WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset. **NOTE:** Reset value for EIM_CS0WCR for WEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000. Example settings: 000 0 EIM clock cycles between end of access and WE negation 001 1 EIM clock cycles between end of access and WE negation 010 2 EIM clock cycles between end of access and WE negation 111 7 EIM clock cycles between end of access and WE negation
5–3 WCSA	Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below.this bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of write access and CS assertion

Table continues on the next page...

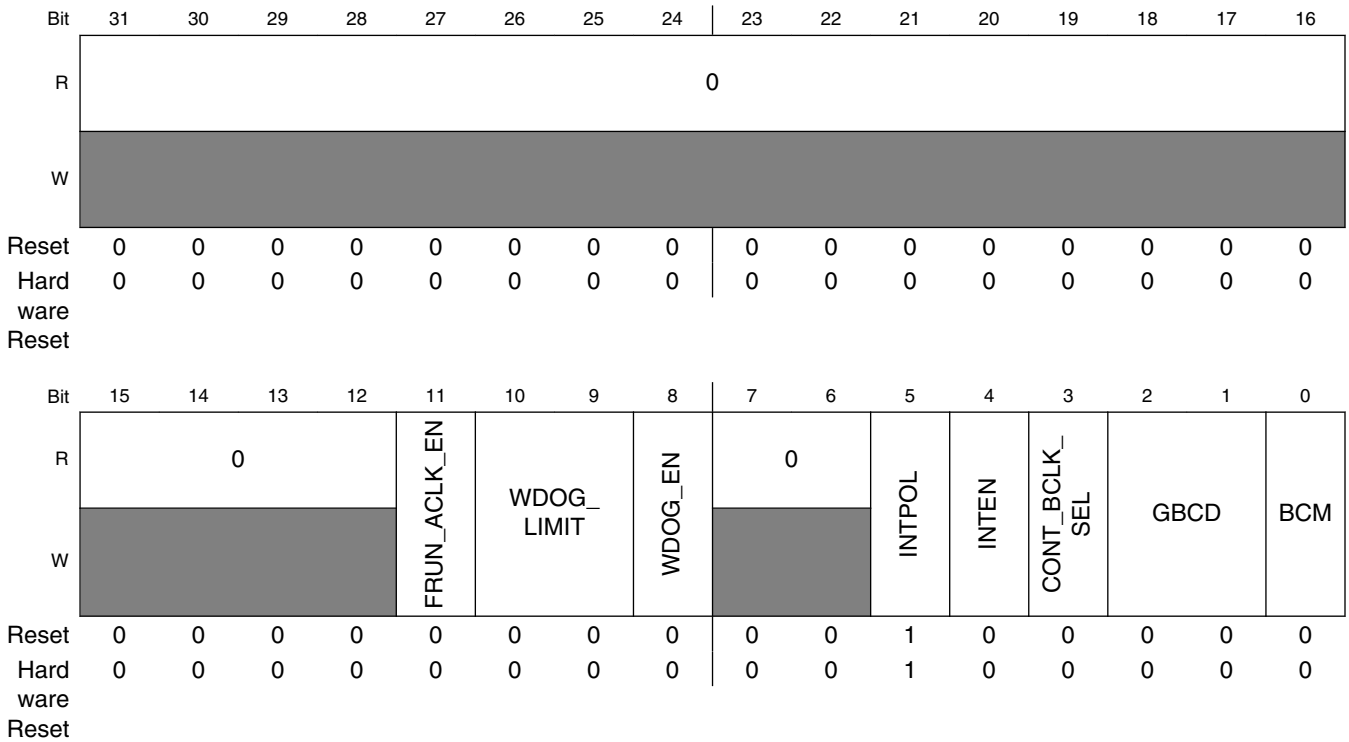
EIM_CS*n*WCR1 field descriptions (continued)

Field	Description
	001 1 EIM clock cycles between beginning of write access and CS assertion 010 2 EIM clock cycles between beginning of write access and CS assertion 111 7 EIMclock cycles between beginning of write access and CS assertion
WCSN	Write CS Negation. This bit field determines when CS signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WCSN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

22.9.6 Chip Select n Write Configuration Register 2 (EIM_CS*n*WCR2)

Address: 21B_8000h base + 14h offset + (24d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															WBCDD
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_CS*n*WCR2 field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 WBCDD	Write Burst Clock Divisor Decrement. If this bit is asserted and BCD value is 0 sync. write access will be preformed as if BCD value is 1.When this bit is negated or BCD value is not 0 this bit has no affect. This bit is cleared by hardware reset.

22.9.7 EIM Configuration Register (EIM_WCR)

Address: 21B_8000h base + 90h offset = 21B_8090h

EIM_WCR field descriptions

Field	Description
31–12 Reserved	Reserved This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WDOG_LIMIT	Memory Watchdog (WDOG) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the WDOG counter terminates the access and send an error response to the master. 00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WDOG_EN	Memory WDOG enable. This bit controls the operation of the wdog counter that terminates the EIM access. 0 Memory WDOG is Disabled 1 Memory WDOG is Enabled

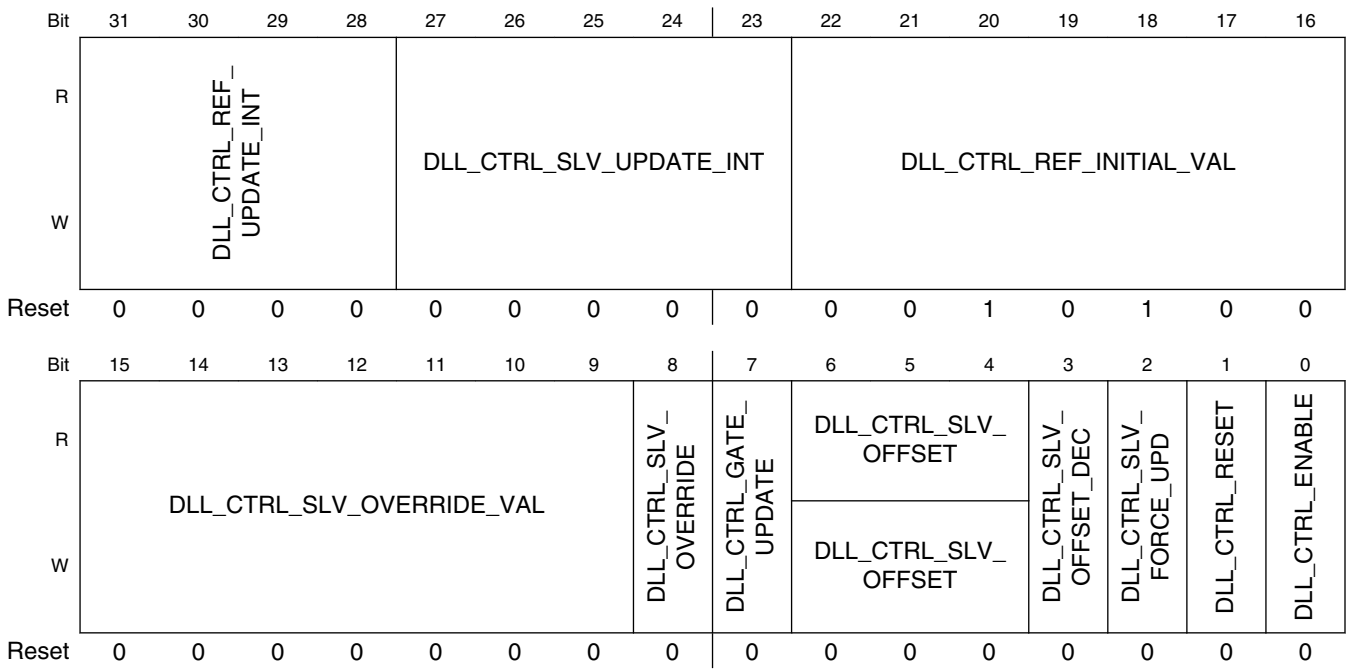


Table continues on the next page...

EIM_WCR field descriptions (continued)

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_ SEL	Continuous BCLK select When this bit is set BCLK pin output continuous clock. Otherwize, BCLK will output clock only when nesserary. 0 BCLK When nesserary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GBCD bit field has no influence. GBCD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. **NOTE:** The BCLK frequency in this mode is according to GBCD bit field. **NOTE:** The BCLK phase is opposite to the EIM clock in this mode if GBCD is 0. **NOTE:** This bit should be used only in async. accesses. No sync access can be executed if this bit is set. **NOTE:** When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

22.9.8 DLL Control Register (EIM_DCR)

Address: 21B_8000h base + 94h offset = 21B_8094h

EIM_DCR field descriptions

Field	Description
31–28 DLL_CTRL_ REF_UPDATE_ INT	Reference DLL Update Interval DLL control loop update interval. The interval cycle is (2 + REF_UPDATE_INT) * ref_clock. By default, the DLL control loop shall update every two ref_clock cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–23 DLL_CTRL_ SLV_UPDATE_ INT	Slave DLL Update Interval If default 0 is used, it means 256 cycles of ref_clock. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
22–16 DLL_CTRL_ REF_INITIAL_ VAL	This field is used to select the initial value of reference chain before DLL enabled. It's recommended to set the initial value close to the locked value to accelerate the locking.
15–9 DLL_CTRL_ SLV_ OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_ SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

EIM_DCR field descriptions (continued)

Field	Description
7 DLL_CTRL_ GATE_UPDATE	Set this bit to 1 to force DLL not update from now on. Since when clock exists, glitches might appear during update. This bit is used by software if we met such kind of condition. Set it to 0 to let DLL update automatically
6–4 DLL_CTRL_ SLV_OFFSET	OFFSET value for DLL_CTRL_SLV_SEL
3 DLL_CTRL_ SLV_OFFSET_ DEC	Slave Chain Offset Decrease Decrease(or increase) the value defined by DLL_CTRL_SLV_OFFSET when calculating DLL_STS_SLV_SEL 0 DLL_STS_SLV_SEL = DLL_STS_REF_SEL + DLL_CTRL_SLV_OFFSET 1 DLL_STS_SLV_SEL = DLL_STS_REF_SEL - DLL_CTRL_SLV_OFFSET
2 DLL_CTRL_ SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when EIM is idle.
1 DLL_CTRL_ RESET	DLL Reset Bit Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-lock. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again
0 DLL_CTRL_ ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled

22.9.9 DLL Status Register (EIM_DSR)

Address: 21B_8000h base + 98h offset = 21B_8098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_STS_REF_SEL								DLL_STS_SLV_SEL						DLL_STS_REF_LOCK	DLL_STS_SLV_LOCK
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_DSR field descriptions

Field	Description
31–16 Reserved	Reserved This read-only field is reserved and always has the value 0.
15–9 DLL_STS_REF_SEL	Reference delay line select taps. Be noted this is encoded by 7 bits for 127taps.
8–2 DLL_STS_SLV_SEL	Slave delay line select status. This is the instant value generated from reference chain. Since only when ref_lock is detected can the reference chain get updated, this value should be the right value next be update to the slave line when reference is locked.
1 DLL_STS_REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to feedback BCLK, allowing the slave delay-line to perform programmed clock delays
0 DLL_STS_SLV_LOCK	Slave delay-line lock status. This signifies that a valid delay has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

22.9.10 EIM IP Access Register (EIM_WIAR)

Address: 21B_8000h base + 9Ch offset = 21B_809Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0											ACLK_EN	ERRST	INT	IPS_ACK	IPS_REQ
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

EIM_WIAR field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 ACLK_EN	ACLK enable. This bit gates the ACLK for the EIM except from FFs that get ipg_aclk_s. After reset ACLK is enabled. 0 ACLK is disabled 1 ACLK is enabled

Table continues on the next page...

EIM_WIAR field descriptions (continued)

Field	Description
3 ERRST	READY After Reset. This bit controls the initial ready/busy status for external devices on CS0 immediately after hardware reset. This is a sticky bit which is cleared once the RDY_INT signal is asserted by the external device. When ERRST = 1 the first fetch access from EIM to the external device located on CS0 will be pending until RDY_INT signal indicates that the external device is ready, then EIM will execute the access. **NOTE:** Reset value for ERRST is EIM_BOOT[4]. 0 RDY_INT After Reset Disable 1 RDY_INT After Reset Enable
2 INT	Interrupt. This bit indicates interrupt assertion by an external device according to RDY_INT signal. When polling this bit, INT=0 indicates interrupt not occurred and INT=1 indicates assertion of the external device interrupt. This bit is cleared by a hardware reset.
1 IPS_ACK	IPS ACK. The EIM is ready for ips access. There is no active AXI access and no new AXI access is accepted till this bit is cleared. This bit is cleared by the master after it completes the ips accesses. 0 Master cannot access ips. 1 Master can access ips.
0 IPS_REQ	IPS request. The Master requests to access one of the IPS registers.Dutring such access the EIM should not preform any AXI/memory accesses. The EIM finishes the AXI accesses that already starts and asserts the IPS_ACK bit. 0 No Master requests ips access 1 Master requests ips access

22.9.11 Error Address Register (EIM_EAR)

Address: 21B_8000h base + A0h offset = 21B_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Error_ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_EAR field descriptions

Field	Description
Error_ADDR	Error Address. This bit field holds the AXI address of the last access that caused error. This register is read only register.

Chapter 23
10/100/1000-Mbps Ethernet MAC (ENET)

23.1 Introduction

The MAC-NET core, in conjunction with a 10/100/1000/1000[1]-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

23.2 Overview

The core implements a triple-speed 10/100/1000/1000[1]-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s and full-duplex gigabit[1] Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

1. Actual throughput is greater than 100 Mbit/s but significantly less than 1000 Mbit/s.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

23.2.1 Features

The MAC-NET core includes the following features.

23.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s and gigabit[2] operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit[2] full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
  - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control

2. Actual throughput is greater than 100 Mbit/s but significantly less than 1000 Mbit/s.

    - Optional forwarding of received pause frames to the user application
    - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors

23.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive

- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers
- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodifed/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

23.2.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

23.2.2 Block diagram

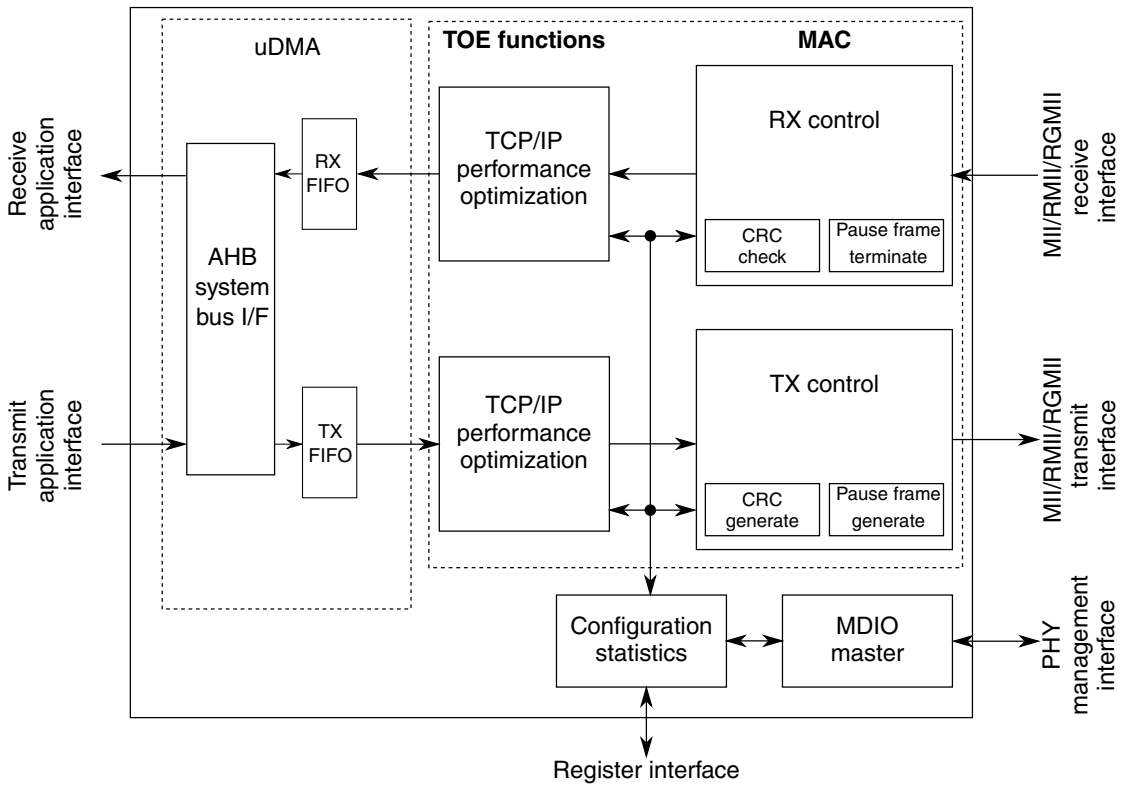

Figure 23-1. Ethernet MAC-NET core block diagram

23.3 External Signals

The table found here describes the external signals of ENET.

Table 23-1. ENET External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the	MII/RMII/ RGMII	ENET_TXD1	ALT4	I

Table 23-1. ENET External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
	When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET_COL	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full duplex mode.	MII	KEY_ROW1	ALT1	I
ENET_CRS	Carrier sense. When asserted, indicates transmit or receive medium is not idle. In RMII mode, this signal is present on the RMII_CRS_DV pin.	MII	KEY_COL3	ALT1	I
ENET_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII/RMII/ RGMII	ENET_MDC	ALT1	O
			KEY_COL2	ALT4	
ENET_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset.	MII/RMII/ RGMII	ENET_MDIO	ALT1	IO
			KEY_COL1	ALT1	
ENET_REF_CLK	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	RMII	GPIO_16	ALT2	I
			RGMII_TX_CTL	ALT7	
ENET_RX_CLK	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER.	MII	GPIO_18	ALT1	I
ENET_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII/RMII	ENET_RXD0	ALT1	I
ENET_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII/RMII	ENET_RXD1	ALT1	I
ENET_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	KEY_COL2	ALT1	I
ENET_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	KEY_COL0	ALT1	I

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal.	MII/RMII	ENET_CRS_DV	ALT1	I
ENET_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII/RMII	ENET_RX_ER	ALT1	I
ENET_TX_CLK	Input clock In MII mode, provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER. IN RGMII mode, provides the external 125 MHz reference clock input.	MII/RGMII	ENET_REF_CLK	ALT1	I
ENET_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	ENET_TXD0	ALT1	O
ENET_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	ENET_TXD1	ALT1	O
ENET_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	KEY_ROW2	ALT1	O
ENET_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	KEY_ROW0	ALT1	O
ENET_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame.	MII/RMII	ENET_TX_EN	ALT1	O
ENET_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII/RMII	GPIO_19	ALT6	O
RGMII_RD0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD0	ALT1	I
RGMII_RD1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD1	ALT1	I
RGMII_RD2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD2	ALT1	I

Table continues on the next page...

Table 23-1. ENET External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
RGMII_RD3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD3	ALT1	I
RGMII_RXC	In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	RGMII	RGMII_RXC	ALT1	I
RGMII_RX_CTL	In RGMII mode, contains RX_EN on the rising edge of RGMII_RXC, and a logical derivative of RX_EN and RX_ER (RX_EN XOR RX_ER) on the falling edge of RGMII_RXC.	RGMII	RGMII_RX_CTL	ALT1	I
RGMII_TD0	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD0	ALT1	O
RGMII_TD1	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD1	ALT1	O
RGMII_TD2	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD2	ALT1	O
RGMII_TD3	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD3	ALT1	O
RGMII_TXC	In RGMII mode, provides a timing reference for TX_DATA[3:0] and TX_CTL.	RGMII	RGMII_TXC	ALT1	O
RGMII_TX_CTL	In RGMII mode, contains TX_EN on the rising edge of RGMII_TXC, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of RGMII_TXC.	RGMII	RGMII_TX_CTL	ALT1	O

23.4 Clocks

The table found here describes the clock sources for ENET. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 23-2. ENET Clocks

Clock name	Clock Root	Description
ipg_clk	ahb_clk_root	Module clock
ipg_clk_mac0	ahb_clk_root	MAC peripheral clock
ipg_clk_mac0_s	ipg_clk_root	MAC peripheral access clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_time	ipg_clk_root	Peripheral clock
mac0_rxmem_clk	ahb_clk_root	MAC receive memory clock
mac0_txmem_clk	ahb_clk_root	MAC transmit memory clock

NOTE

The ENET module requires ahb_clk_root to be 125 MHz or greater.

23.5 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 23-3. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

ENET memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
218_8004	Interrupt Event Register (ENET_EIR)	32	w1c	0000_0000h	23.5.1/1072

23.5.1 Interrupt Event Register (ENET_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: 218_8000h base + 4h offset = 218_8004h

ENET_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. **NOTE:** The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
25 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. **NOTE:** In situations where the device has various masters generating high traffic, a FIFO underrun can occur on the transmit FIFO. To avoid transmit FIFO underrun, store and forward can be enabled

Table continues on the next page...

ENET_EIR field descriptions (continued)

Field	Description
	in ENET_TFWR[STRFWD]. See STRFWD. Also, a higher priority can be set for ENET traffic using available means on the central bus fabric connecting the ENET module.
18 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

23.5.2 Interrupt Mask Register (ENET_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 218_8000h base + 8h offset = 218_8008h

ENET_EIMR field descriptions

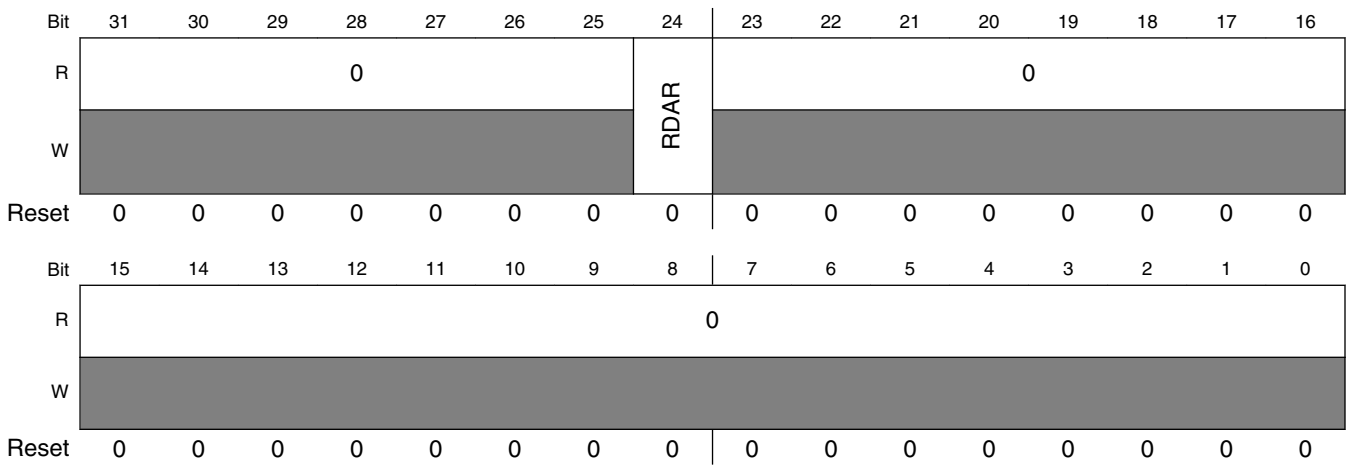
Field	Description
31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
30 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
29 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
28 GRA	GRA Interrupt Mask Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The

Table continues on the next page...

ENET_EIMR field descriptions (continued)

Field	Description
	corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
27 TXF	TXF Interrupt Mask Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
26 TXB	TXB Interrupt Mask Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
25 RXF	RXF Interrupt Mask Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
24 RXB	RXB Interrupt Mask Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
23 MII	MII Interrupt Mask Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
22 EBERR	EBERR Interrupt Mask Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
21 LC	LC Interrupt Mask Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

Table continues on the next page...



ENET_EIMR field descriptions (continued)

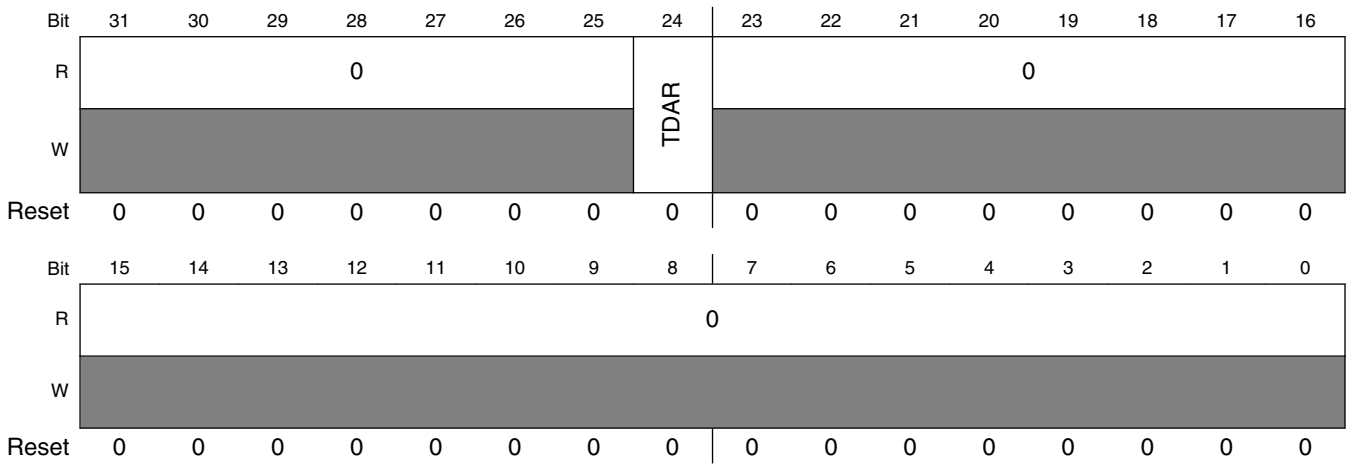
Field	Description
20 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
19 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
18 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

23.5.3 Receive Descriptor Active Register (ENET_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 218_8000h base + 10h offset = 218_8010h

ENET_RDAR field descriptions



Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

23.5.4 Transmit Descriptor Active Register (ENET_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 218_8000h base + 14h offset = 218_8014h

ENET_TDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

23.5.5 Ethernet Control Register (ENET_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 218_8000h base + 24h offset = 218_8024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved														Reserved	
Reset	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved				Reserved	Reserved	Reserved	DBSWP	STOPEN	DBGEN	SPEED	EN1588	SLEEP	MAGICEN	ETHEREN	RESET
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ECR field descriptions

Field	Description
31–18 Reserved	This field is reserved. Always write 11110000000000b to this field.
17–12 Reserved	This field is reserved. Always write 0 to this field.
11 Reserved	This field is reserved. Always write 0 to this field.
10 Reserved	This field is reserved. Always write 0 to this field.
9 Reserved	This field is reserved. Always write 0 to this field.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. **NOTE:** This field must be written to 1 after reset. 0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
7 STOPEN	STOPEN Signal Control Controls device behavior in doze mode. In doze mode, if this field is set then all the clocks of the ENET assembly are disabled, except the RMII /MII clock. Doze mode is similar to a conditional stop mode entry for the ENET assembly depending on ECR[STOPEN].

Table continues on the next page...

ENET_ECR field descriptions (continued)

Field	Description
	NOTE: If module clocks are gated in this mode, the module can still wake the system after receiving a magic packet in stop mode. MAGICEN must be set prior to entering sleep/stop mode.
6 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
5 SPEED	Selects between 10/100-Mbit/s and 1000-Mbit/s modes of operation. 0 10/100-Mbit/s mode 1 1000-Mbit/s mode (Actual throughput is greater than 100 Mbit/s but significantly less than 1000 Mbit/s.)
4 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
3 SLEEP	Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.
2 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection. **NOTE:** MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection. **NOTE:** EIMR[WAKEUP] must be written to one if Magic packet wakeup is programed to wake up the chip from low power mode. 0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.
1 ETHEREN	Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: • RESET is set by software • An error condition causes the EBERR field to set. **NOTE:** • ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only *after* all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. 0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.

Table continues on the next page...

ENET_ECR field descriptions (continued)

Field	Description
0 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

23.5.6 MII Management Frame Register (ENET_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 218_8000h base + 40h offset = 218_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See Table 23-41 (Clause 22) or Table 23-43 (Clause 45) for correct value.
29–28 OP	Operation Code See Table 23-41 (Clause 22) or Table 23-43 (Clause 45) for correct value.
27–23 PA	PHY Address See Table 23-41 (Clause 22) or Table 23-43 (Clause 45) for correct value.
22–18 RA	Register Address See Table 23-41 (Clause 22) or Table 23-43 (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

23.5.7 MII Speed Control Register (ENET_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (that is, peripheral bus clock) is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

MII clock frequency = 25 MHz / ((4 + 1) x 2) = 2.5 MHz

The following table shows the optimum values for MII_SPEED as a function of IPS bus clock frequency.

Table 23-4. Programming Examples for MSCR

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: 218_8000h base + 44h offset = 218_8044h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ENET_MSCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles 010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
6–1 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: 1/((MII_SPEED + 1) x 2) of the internal module clock frequency
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

23.5.8 MIB Control Register (ENET_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: 218_8000h base + 64h offset = 218_8064h

ENET_MIBC field descriptions

Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.

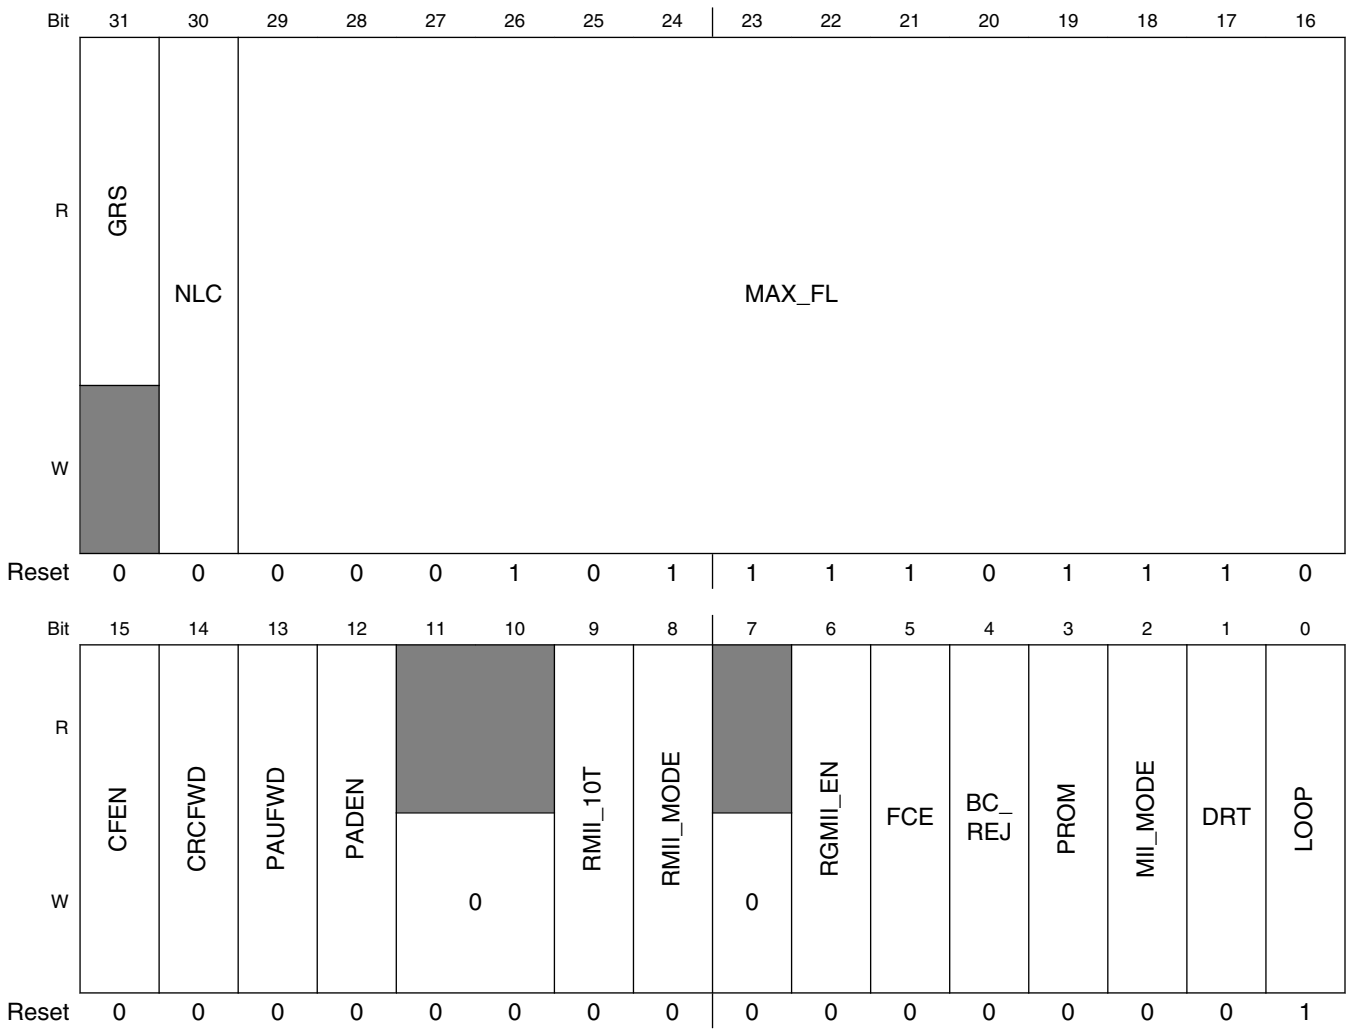

Table continues on the next page...

ENET_MIBC field descriptions (continued)

Field	Description
30 MIB_IDLE	MIB Idle 0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear **NOTE:** This field is not self-clearing. To clear the MIB counters set and then clear this field. 0 See note above. 1 All statistics counters are reset to 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

23.5.9 Receive Control Register (ENET_RCR)

Address: 218_8000h base + 84h offset = 218_8084h

ENET_RCR field descriptions

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLR] field.
29–16 MAX_FL	Maximum Frame Length

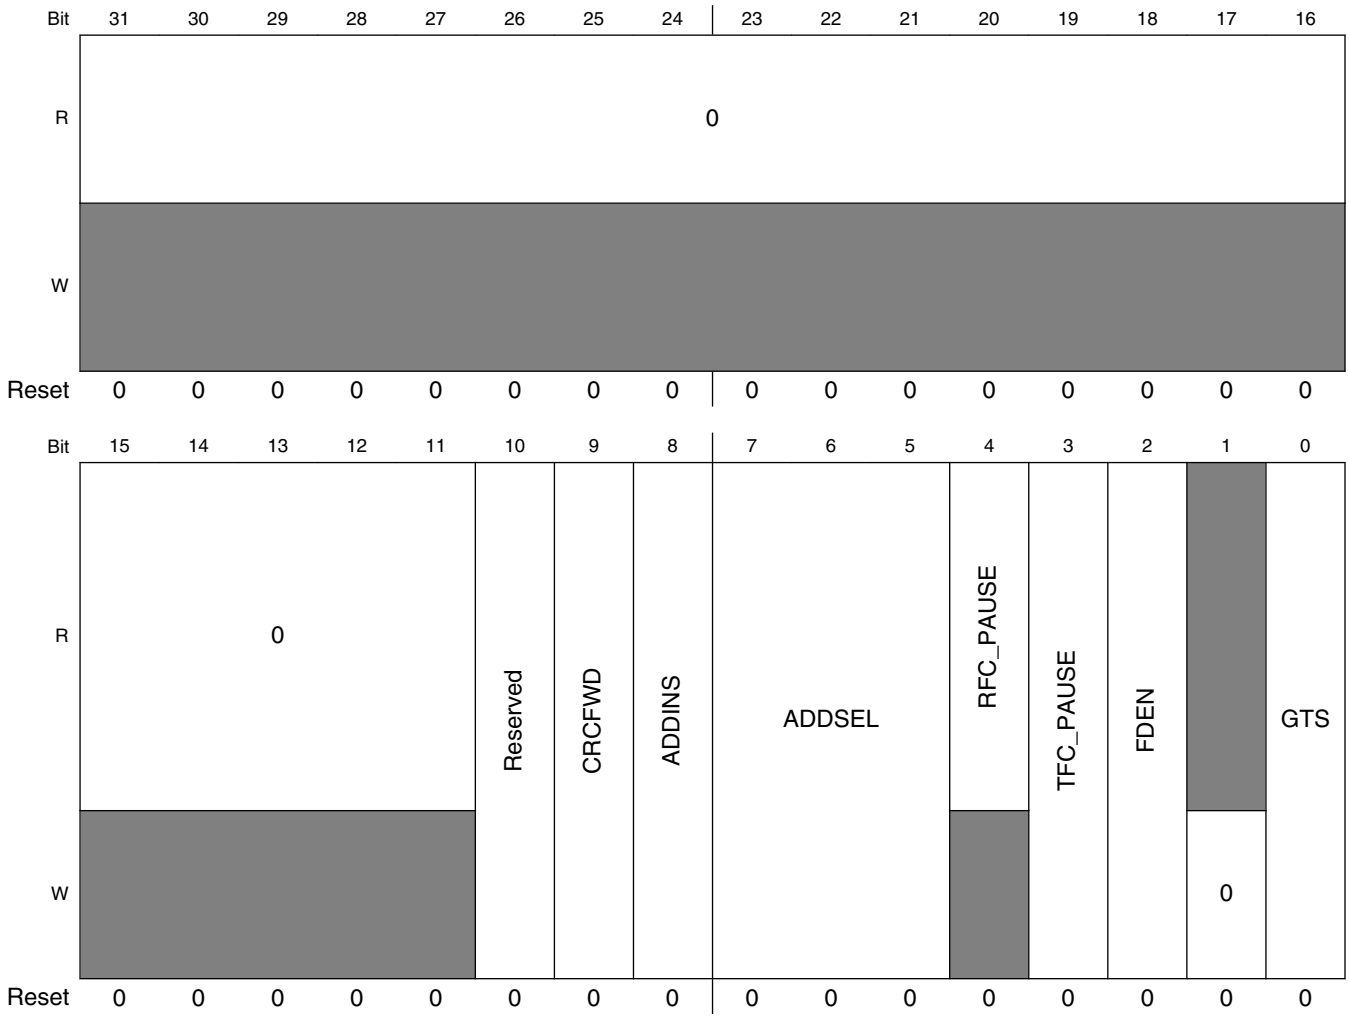
Table continues on the next page...

ENET_RCR field descriptions (continued)

Field	Description
	Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. **NOTE:** If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII or RGMII . 0 100-Mbit/s operation. 1 10-Mbit/s operation.
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared . **NOTE:** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE]. 0 MAC configured for MII mode. 1 MAC configured for RMII operation.
7 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
6 RGMII_EN	RGMII Mode Enable **NOTE:** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE].

Table continues on the next page...

ENET_RCR field descriptions (continued)



Field	Description
	0 MAC configured for non-RGMII operation 1 MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000-Mbit/s[1] mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100-Mbit/s mode.
5 FCE	Flow Control Enable If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
4 BC_REJ	Broadcast Frame Reject If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
3 PROM	Promiscuous Mode All frames are accepted regardless of address matching. 0 Disabled. 1 Enabled.
2 MII_MODE	Media Independent Interface Mode This field must always be set. 0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	Disable Receive On Transmit 0 Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. (Normally used for half-duplex mode.)
0 LOOP	Internal Loopback This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0. 0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

1. Actual throughput is greater than 100 Mbit/s but significantly less than 1000 Mbit/s.

23.5.10 Transmit Control Register (ENET_TCR)

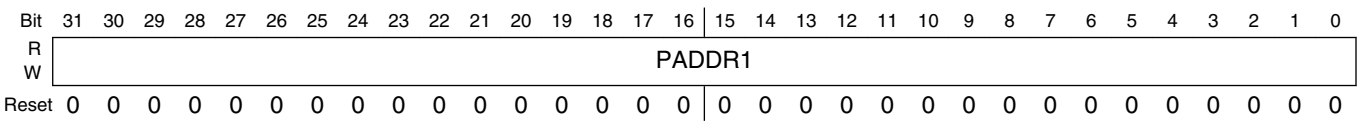
TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 218_8000h base + C4h offset = 218_80C4h

ENET_TCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC

Table continues on the next page...



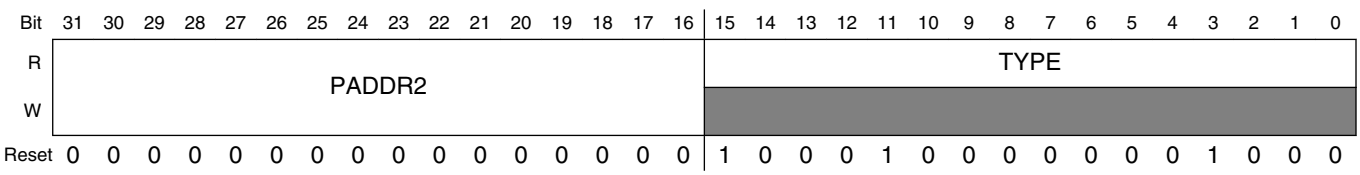
ENET_TCR field descriptions (continued)

Field	Description
	0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.
8 ADDINS	Set MAC Address On Transmit 0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
7–5 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.
4 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
3 TFC_PAUSE	Transmit Frame Control Pause Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.
2 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.
1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.

23.5.11 Physical Address Lower Register (ENET_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: 218_8000h base + E4h offset = 218_80E4h



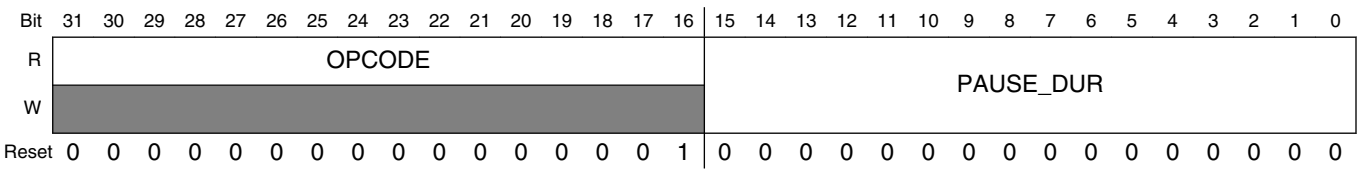
ENET_PALR field descriptions

Field	Description
PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

23.5.12 Physical Address Upper Register (ENET_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: 218_8000h base + E8h offset = 218_80E8h



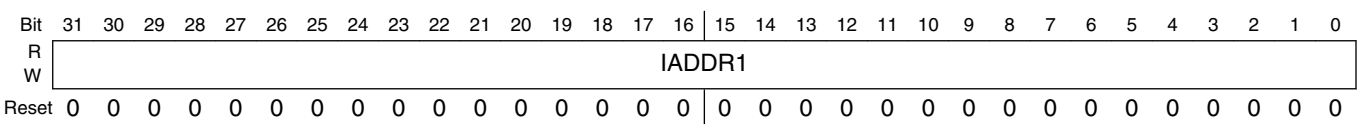
ENET_PAUR field descriptions

Field	Description
31–16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

23.5.13 Opcode/Pause Duration Register (ENET_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 218_8000h base + ECh offset = 218_80ECh



ENET_OPD field descriptions

Field	Description
31–16 OPCODE	Opcode Field In PAUSE Frames These fields have a constant value of 0x0001.
PAUSE_DUR	Pause Duration Pause duration field used in PAUSE frames.

23.5.14 Descriptor Individual Upper Address Register (ENET_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 218_8000h base + 118h offset = 218_8118h

ENET_IAUR field descriptions

Field	Description
IADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR1 contains hash index bit 63. Bit 0 of IADDR1 contains hash index bit 32.

23.5.15 Descriptor Individual Lower Address Register (ENET_IALR)

IALR contains the lower 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the DA field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 218_8000h base + 11Ch offset = 218_811Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_IALR field descriptions

Field	Description
IADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0.

23.5.16 Descriptor Group Upper Address Register (ENET_GAUR)

GAUR contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 218_8000h base + 120h offset = 218_8120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_GAUR field descriptions

Field	Description
GADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32.

23.5.17 Descriptor Group Lower Address Register (ENET_GALR)

GALR contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

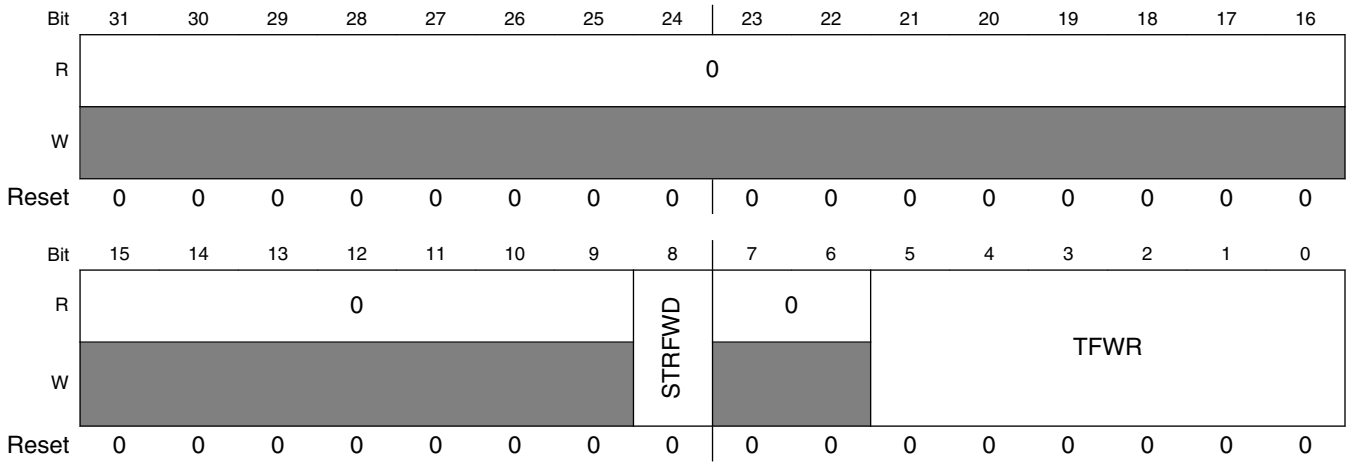
Address: 218_8000h base + 124h offset = 218_8124h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GADDR2																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

23.5.18 Transmit FIFO Watermark Register (ENET_TFWR)



If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: 218_8000h base + 144h offset = 218_8144h

ENET_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. **NOTE:** If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... ... 111111 4032 bytes written.

23.5.19 Receive Descriptor Ring Start Register (ENET_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

NOTE

This register must be initialized prior to operation

Address: 218_8000h base + 180h offset = 218_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	X_DES_START														0	
W														0		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TDSR field descriptions

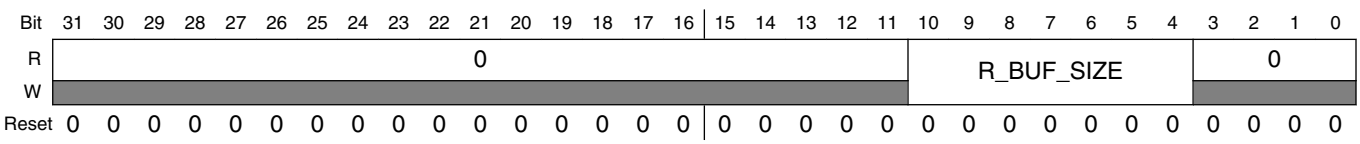
Field	Description
31–3 X_DES_START	Pointer to the beginning of the transmit buffer descriptor queue.

Table continues on the next page...

ENET_TDSR field descriptions (continued)

Field	Description
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

23.5.21 Maximum Receive Buffer Size Register (ENET_MRBR)



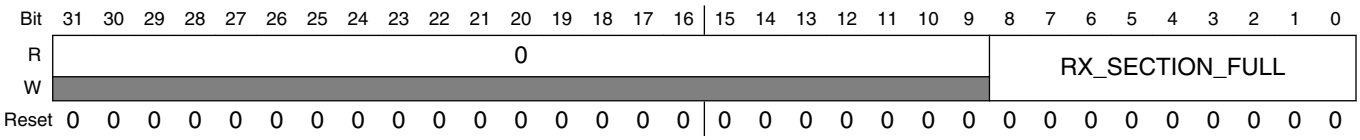
The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R_BUF_SIZE is concatentated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 16. To ensure this, the lower four bits are set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

Address: 218_8000h base + 188h offset = 218_8188h

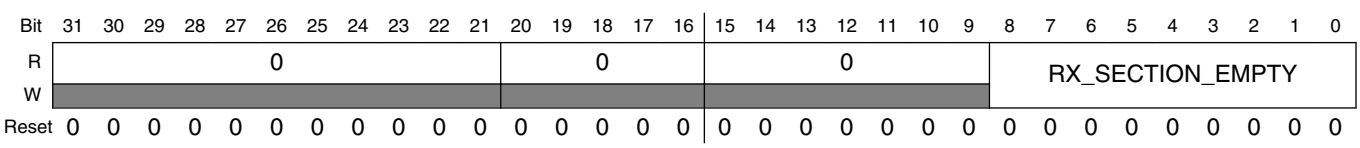


ENET_MRBR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–4 R_BUF_SIZE	Receive buffer size in bytes. This value, concatenated with the four least-significant bits of this register (which are always zero), is the effective maximum receive buffer size.
Reserved	This field, which is always zero, is the four least-significant bits of the maximum receive buffer size. This field is reserved. This read-only field is reserved and always has the value 0.

23.5.22 Receive FIFO Section Full Threshold (ENET_RSFL)

Address: 218_8000h base + 190h offset = 218_8190h



ENET_RSFL field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_FULL	Value Of Receive FIFO Section Full Threshold Value, in 64-bit words, of the receive FIFO section full threshold. Clear this field to enable store and forward on the RX FIFO. When programming a value greater than 0 (cut-through operation), it must be greater than RAEM[RX_ALMOST_EMPTY]. When the FIFO level reaches the value in this field, data is available in the Receive FIFO (cut-through operation).

23.5.23 Receive FIFO Section Empty Threshold (ENET_RSEM)

Address: 218_8000h base + 194h offset = 218_8194h

ENET_RSEM field descriptions

Field	Description
31–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued. A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client.

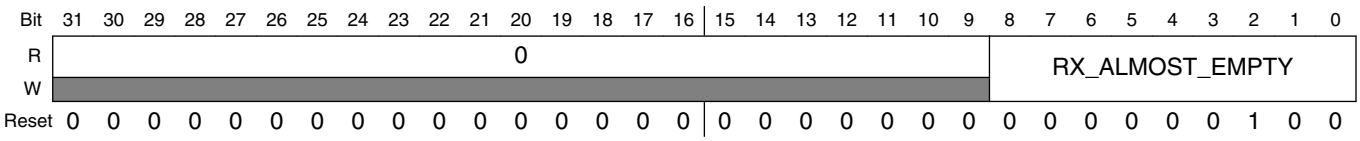


Table continues on the next page...

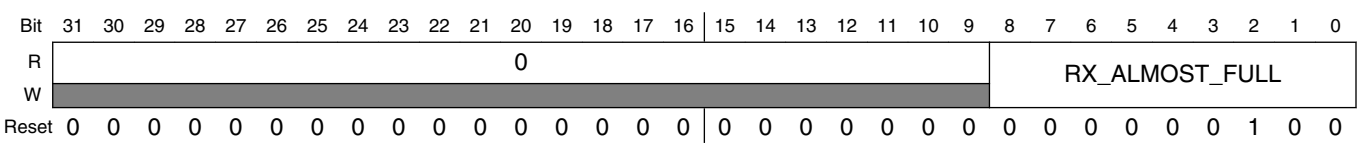
ENET_RSEM field descriptions (continued)

Field	Description
	NOTE: The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

23.5.24 Receive FIFO Almost Empty Threshold (ENET_RAEM)

Address: 218_8000h base + 198h offset = 218_8198h



ENET_RAEM field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

23.5.25 Receive FIFO Almost Full Threshold (ENET_RAFL)

Address: 218_8000h base + 19Ch offset = 218_819Ch

ENET_RAFL field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

23.5.26 Transmit FIFO Section Empty Threshold (ENET_TSEM)

Address: 218_8000h base + 1A0h offset = 218_81A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_SECTION_EMPTY																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TSEM field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_SECTION_ EMPTY	Value Of The Transmit FIFO Section Empty Threshold Value, in 64-bit words, of the transmit FIFO section empty threshold. See Transmit FIFO for more information.

23.5.27 Transmit FIFO Almost Empty Threshold (ENET_TAEM)

Address: 218_8000h base + 1A4h offset = 218_81A4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_TAEM field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_ EMPTY	Value of Transmit FIFO Almost Empty Threshold Value, in 64-bit words, of the transmit FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See Transmit FIFO for more information. A minimum value of 4 should be set.

23.5.28 Transmit FIFO Almost Full Threshold (ENET_TAFL)

Address: 218_8000h base + 1A8h offset = 218_81A8h

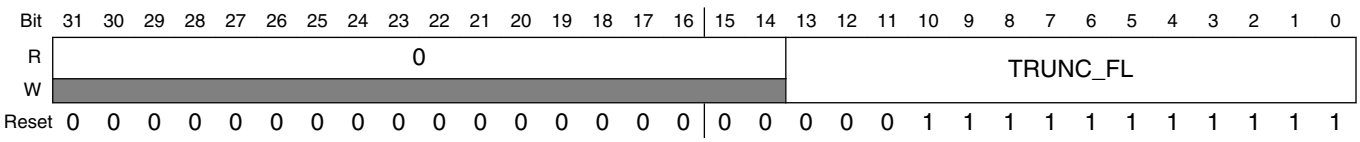
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_ALMOST_FULL															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

ENET_TAFL field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5). When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See Transmit FIFO for more information. **NOTE:** A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

23.5.29 Transmit Inter-Packet Gap (ENET_TIPG)

Address: 218_8000h base + 1ACh offset = 218_81ACh



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																											IPG				
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0

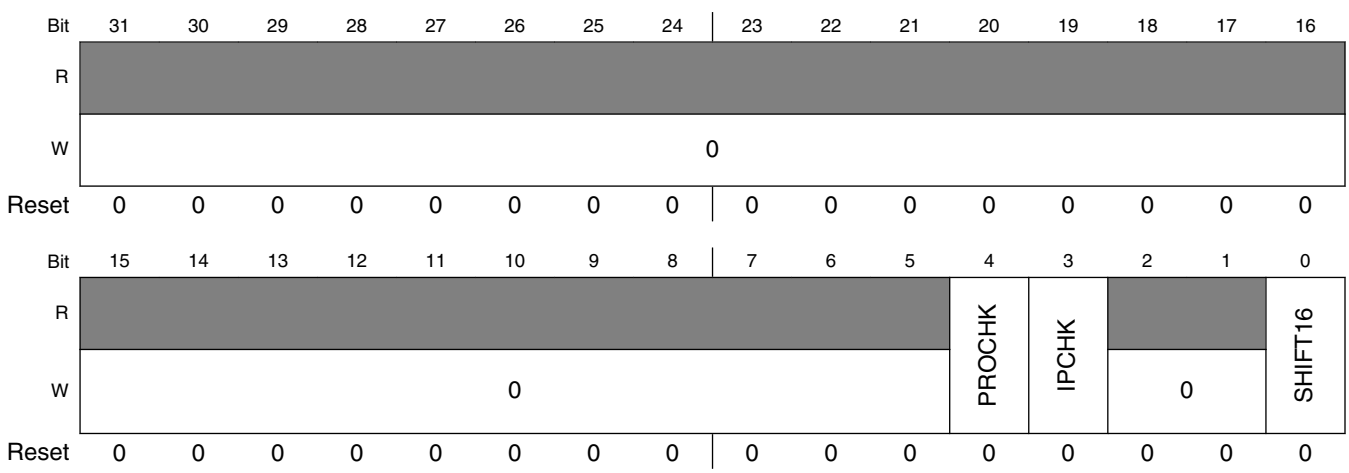
ENET_TIPG field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
IPG	Transmit Inter-Packet Gap Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12. **NOTE:** The IPG value read will be the value that was written, even if it is out of range.

23.5.30 Frame Truncation Length (ENET_FTRL)

Address: 218_8000h base + 1B0h offset = 218_81B0h

ENET_FTRL field descriptions



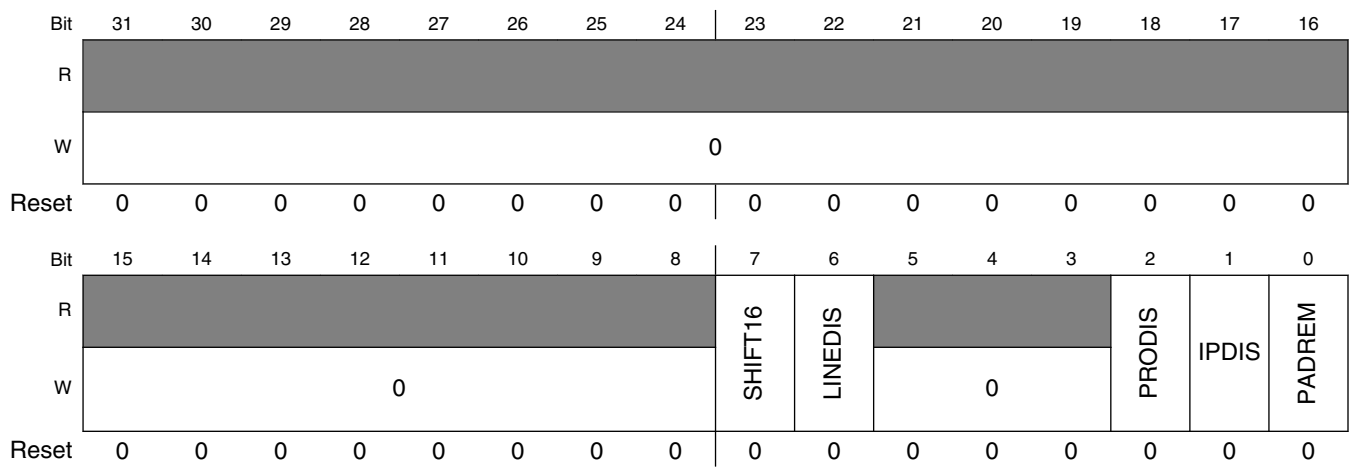
Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	Frame Truncation Length Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. **NOTE:** Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

23.5.31 Transmit Accelerator Function Configuration (ENET_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: 218_8000h base + 1C0h offset = 218_81C0h



ENET_TACC field descriptions

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

23.5.32 Receive Accelerator Function Configuration (ENET_RACC)

Address: 218_8000h base + 1C4h offset = 218_81C4h

ENET_RACC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

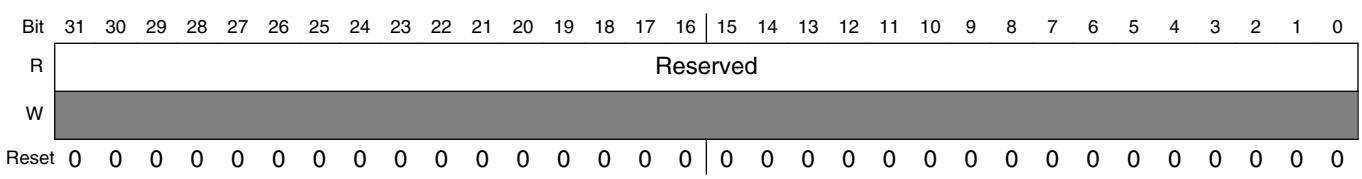


Table continues on the next page...

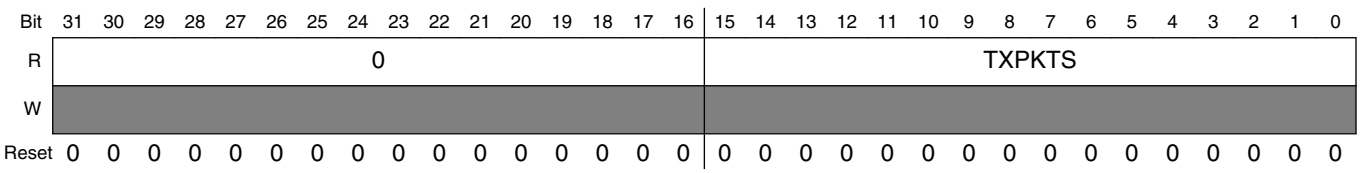
ENET_RACC field descriptions (continued)

Field	Description
7 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. **NOTE:** This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors 0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
5–3 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

23.5.33 Reserved Statistic Register (ENET_RMON_T_DROP)

Address: 218_8000h base + 200h offset = 218_8200h



ENET_RMON_T_DROP field descriptions

Field	Description

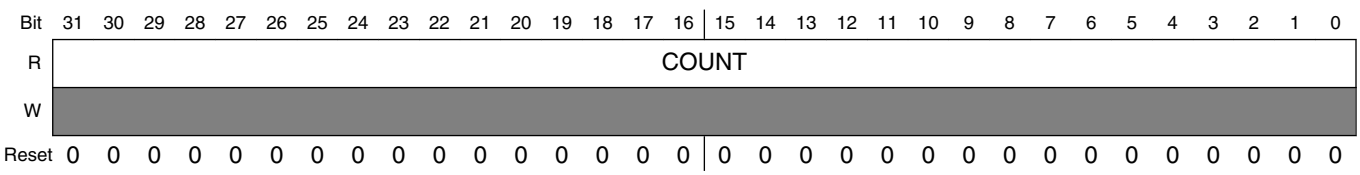
ENET_IEEE_T_SQE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	This read-only field is reserved and always has the value 0. **NOTE:** Counter not implemented as no SQE information is available.

23.5.61 Flow Control Pause Frames Transmitted Statistic Register (ENET_IEEE_T_FDXFC)

Address: 218_8000h base + 270h offset = 218_8270h



ENET_IEEE_T_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames transmitted

23.5.62 Octet Count for Frames Transmitted w/o Error Statistic Register (ENET_IEEE_T_OCTETS_OK)

Address: 218_8000h base + 274h offset = 218_8274h

ENET_IEEE_T_OCTETS_OK field descriptions

Field	Description
COUNT	Octet count for frames transmitted without error **NOTE** Counts total octets (includes header and FCS fields).

23.5.63 Rx Packet Count Statistic Register (ENET_RMON_R_PACKETS)

Address: 218_8000h base + 284h offset = 218_8284h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_IEEE_R_FDXFC field descriptions

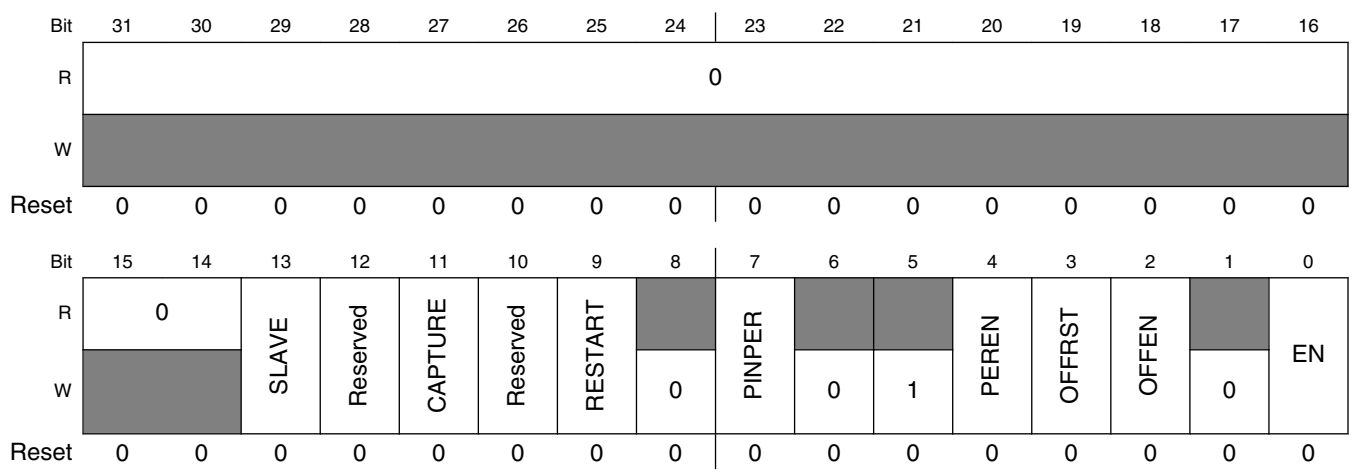
Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames received

23.5.86 Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK)

Address: 218_8000h base + 2E0h offset = 218_82E0h

ENET_IEEE_R_OCTETS_OK field descriptions

Field	Description
COUNT	Number of octets for frames received without error **NOTE:** Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).



23.5.87 Adjustable Timer Control Register (ENET_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

NOTE

The CAPTURE and RESTART fields and bits 12 and 10 must be 0 in order to write to the other fields in this register.

Address: 218_8000h base + 400h offset = 218_8400h

ENET_ATCR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 Reserved	This field is reserved. Always write 0 to this field.
11 CAPTURE	Capture Timer Value When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. **NOTE:** To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles. 0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. Always write 0 to this field.
9 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. RESTART should be used when the timer is enabled. **NOTE:** The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event. **NOTE:** Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved. **NOTE:** This field must be written always with one.
4 PEREN	Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit.

Table continues on the next page...

ENET_ATCR field descriptions (continued)

Field	Description
	NOTE: Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1 Reserved	This field is reserved.
0 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

23.5.88 Timer Value Register (ENET_ATVR)

Address: 218_8000h base + 404h offset = 218_8404h

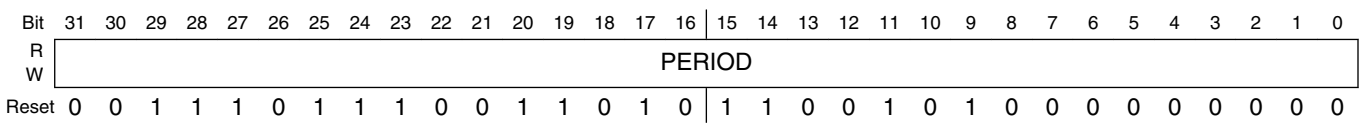
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ATIME																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ATVR field descriptions

Field	Description
ATIME	A write sets the timer. A read returns the last captured value. To read the current value, issue a capture command (i.e., set ATCR[CAPTURE]) prior to reading this register.

23.5.89 Timer Offset Register (ENET_ATOFF)

Address: 218_8000h base + 408h offset = 218_8408h



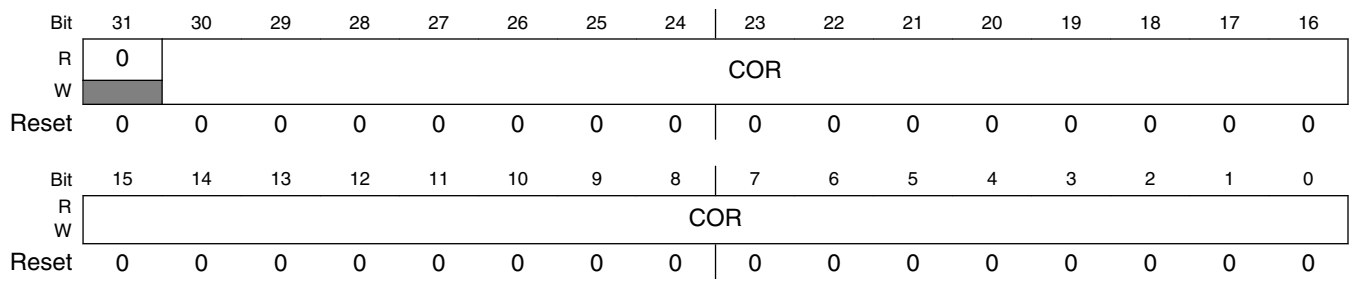
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	OFFSET																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ATOFF field descriptions

Field	Description
OFFSET	Offset value for one-shot event generation. When the timer reaches the value, an event can be generated to reset the counter. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds.

23.5.90 Timer Period Register (ENET_ATPER)

Address: 218_8000h base + 40Ch offset = 218_840Ch



ENET_ATPER field descriptions

Field	Description
PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. **NOTE:** The value of PERIOD has the following constraint: 2^{32} – ENET_ATINC[INC_COR] – 3×ENET_ATINC[INC] ≥ PERIOD > 0.

23.5.91 Timer Correction Register (ENET_ATCOR)

Address: 218_8000h base + 410h offset = 218_8410h

ENET_ATCOR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COR	Correction Counter Wrap-Around Value

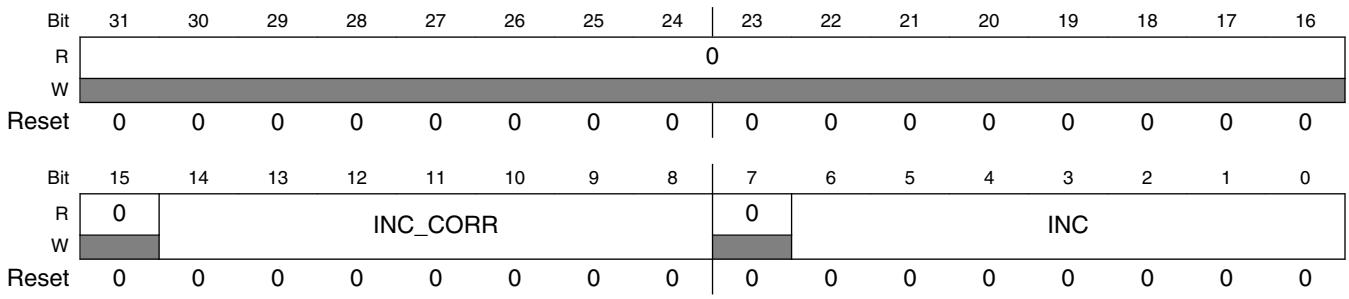


Table continues on the next page...

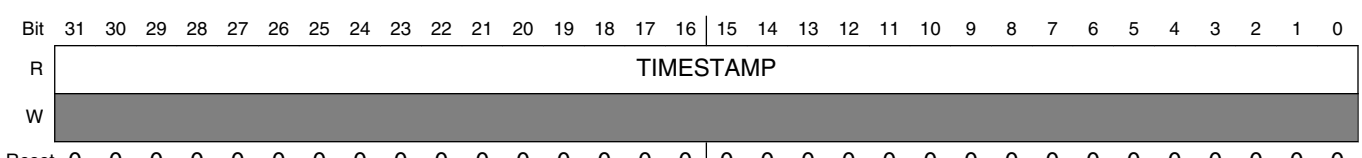
ENET_ATCOR field descriptions (continued)

Field	Description
	Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur. **NOTE:** This value is given in clock cycles, not in nanoseconds as all other values.

23.5.92 Time-Stamping Clock Period Register (ENET_ATINC)

Address: 218_8000h base + 414h offset = 218_8414h



ENET_ATINC field descriptions

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–8 INC_CORR	Correction Increment Value This value is added every time the correction timer expires (every clock cycle given in ATCOR). A value less than INC slows down the timer. A value greater than INC speeds up the timer.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
INC	Clock Period Of The Timestamping Clock (ts_clk) In Nanoseconds The timer increments by this amount each clock cycle. For example, set to 10 for 100 MHz, 8 for 125 MHz, 5 for 200 MHz. **NOTE:** For highest precision, use a value that is an integer fraction of the period set in ATPER.

23.5.93 Timestamp of Last Transmitted Frame (ENET_ATSTMP)

Address: 218_8000h base + 418h offset = 218_8418h

ENET_ATSTMP field descriptions

Field	Description
TIMESTAMP	Timestamp of the last frame transmitted by the core that had TxBD[TS] set . This register is only valid when EIR[TS_AVAIL] is set.

23.5.94 Timer Global Status Register (ENET_TGSR)

Address: 218_8000h base + 604h offset = 218_8604h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TGSR field descriptions

Field	Description
31–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 TF3	Copy Of Timer Flag For Channel 3 0 Timer Flag for Channel 3 is clear 1 Timer Flag for Channel 3 is set
2 TF2	Copy Of Timer Flag For Channel 2 0 Timer Flag for Channel 2 is clear 1 Timer Flag for Channel 2 is set
1 TF1	Copy Of Timer Flag For Channel 1 0 Timer Flag for Channel 1 is clear 1 Timer Flag for Channel 1 is set
0 TF0	Copy Of Timer Flag For Channel 0 0 Timer Flag for Channel 0 is clear 1 Timer Flag for Channel 0 is set

23.5.95 Timer Control Status Register (ENET_TCSR*n*)

Address: 218_8000h base + 608h offset + (8d × i), where i=0d to 3d

ENET_TCSR*n* field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–11 Reserved	This field is reserved. This field must be written with 0.
10–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TF	Timer Flag Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it. 0 Input Capture or Output Compare has not occurred. 1 Input Capture or Output Compare has occurred.
6 TIE	Timer Interrupt Enable 0 Interrupt is disabled 1 Interrupt is enabled
5–2 TMODE	Timer Mode Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first. 0000 Timer Channel is disabled. 0001 Timer Channel is configured for Input Capture on rising edge. 0010 Timer Channel is configured for Input Capture on falling edge. 0011 Timer Channel is configured for Input Capture on both edges. 0100 Timer Channel is configured for Output Compare - software only. 0101 Timer Channel is configured for Output Compare - toggle output on compare. 0110 Timer Channel is configured for Output Compare - clear output on compare. 0111 Timer Channel is configured for Output Compare - set output on compare. 1000 Reserved

Table continues on the next page...

ENET_TCSR*n* field descriptions (continued)

Field	Description
	1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow. 10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow. 110X Reserved 1110 Timer Channel is configured for Output Compare - pulse output low on compare for one 1588-clock cycle. 1111 Timer Channel is configured for Output Compare - pulse output high on compare for one 1588-clock cycle.
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
0 TDRE	Timer DMA Request Enable 0 DMA request is disabled 1 DMA request is enabled

23.5.96 Timer Compare Capture Register (ENET_TCCR*n*)

Address: 218_8000h base + 60Ch offset + (8d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TCC																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TCCR*n* field descriptions

Field	Description
TCC	Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag. The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow. When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.

23.6 Functional description

This section provides a complete functional description of the MAC-NET core.

23.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

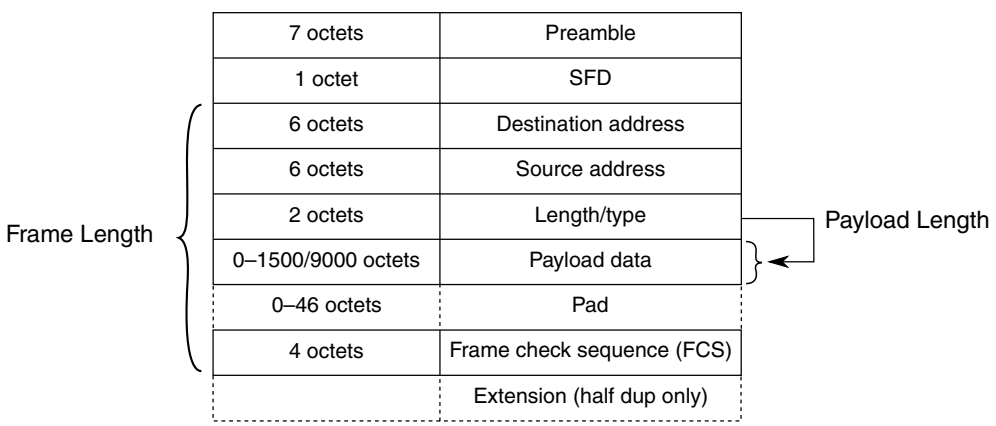

Figure 23-2. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

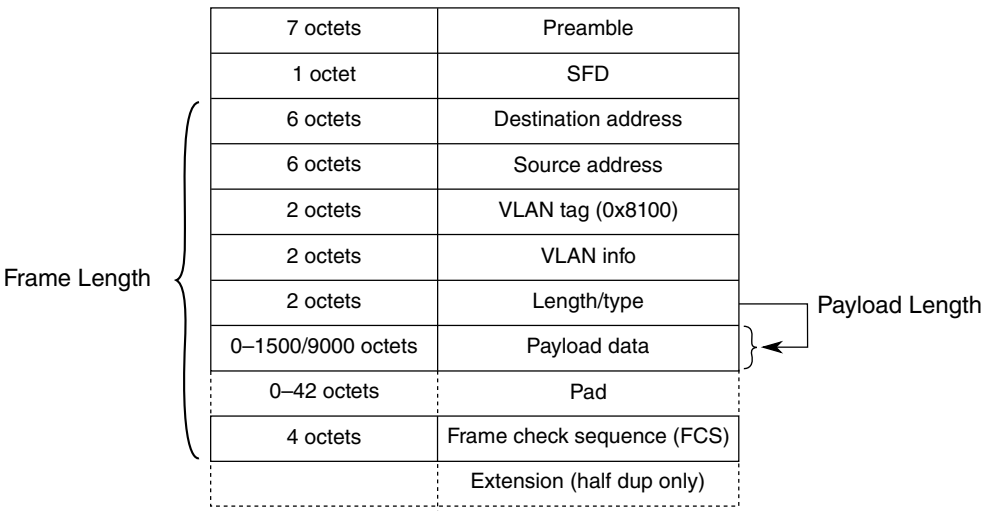

Figure 23-3. VLAN-tagged MAC frame format overview

Table 23-5. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. • If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. • If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check.

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

23.6.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 23-6. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27 –68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see Full-duplex flow control operation for details).

23.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in Magic packet detection.

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

23.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

23.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 23-7. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

23.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 23-8. IPv4 header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Version	IHL	TOS		Length			
Fragment ID				Flags	Fragment offset		
TTL		Protocol		Header checksum			
Source address							
Destination address							
Options							

Table 23-9. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

23.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly.The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/ traffic class fields).

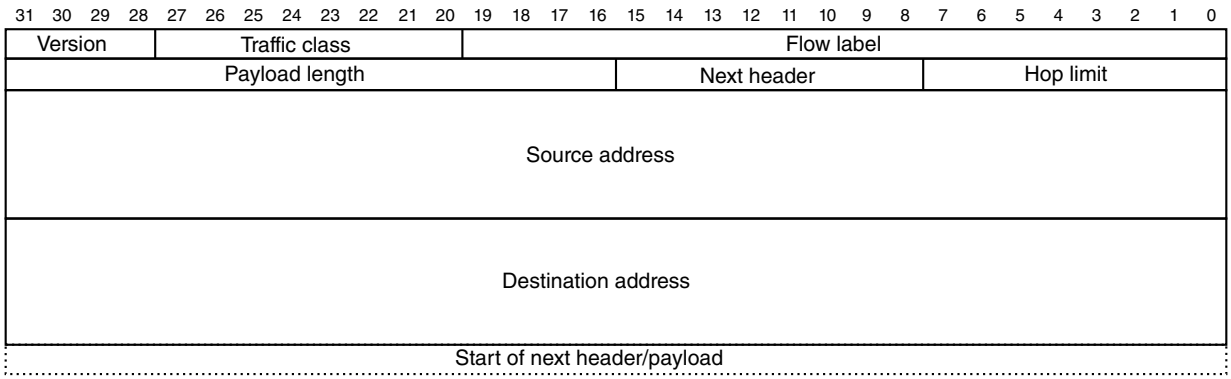

Figure 23-4. IPv6 header format

Table 23-10. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

23.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 23-11. ICMP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Type		Code		Checksum			
ICMP message data							

Table 23-12. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type

Table continues on the next page...

Table 23-12. IP header fields (continued)

Field name	Description
Checksum	16-bit one's complement checksum over the complete ICMP datagram

23.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 23-13. UDP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Length				Checksum			

Table 23-14. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

23.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 23-15. TCP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Sequence number							
Acknowledgement number							

Table continues on the next page...

Table 23-15. TCP header format (continued)

Offset	Reserved	Flags	Window	
Checksum			Urgent pointer	
Options				

Table 23-16. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

23.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

23.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

23.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

Table 23-17 shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 23-17. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 23-18. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

23.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 23-19. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

23.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

23.6.3.2.1 PTPv1 header

Table 23-20. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in Table 23-21 :

Table 23-21. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

23.6.3.2.2 PTPv2 header

Table 23-22. Common PTPv2 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2

6	Profile specific	
7	—	Reserved

23.6.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

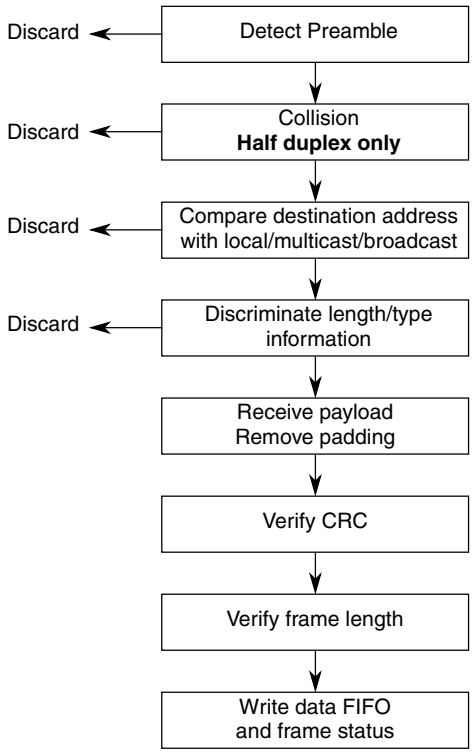

Figure 23-5. MAC receive flow

23.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

23.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

23.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

23.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

23.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET*n*_GAUR/GALR (group address hash match) or ENET*n*_IAUR/IALR (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET*n*_GAUR (msb = 1) or ENET*n*_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled (ENET*n*_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET*n*_GAUR/GALR and ENET*n*_IAUR/IALR settings.

23.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET*n*_RCR[PROM] is set. If PROM is cleared when ENET*n*_RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 23-25. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

23.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:

- Node address (PALR[PADDR1] and PAUR[PADDR2])
- Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])

- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

23.6.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

23.6.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET*n*_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

23.6.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

23.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET*n*_RCR[FCE] is cleared and are forwarded to the client interface when ENET*n*_RCR[PAUFWD] is set.

23.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET*n*_RCR[CRCFWD] is cleared and ENET*n*_RCR[PADEN] is cleared. When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

23.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET*n*_RCR[PADEN].

Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the

padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

23.6.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET*n*_TCR[TFC_PAUSE] is set with ENET*n*_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

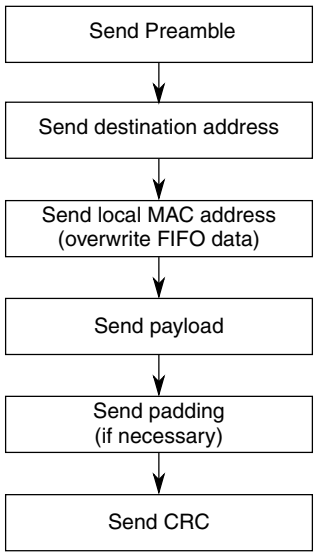

Figure 23-6. Frame transmit overview

23.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

23.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET*n*_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET*n*_TCR[ADDINS] = 0)

23.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

23.6.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET*n*_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII_CRS de-assertion.

23.6.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

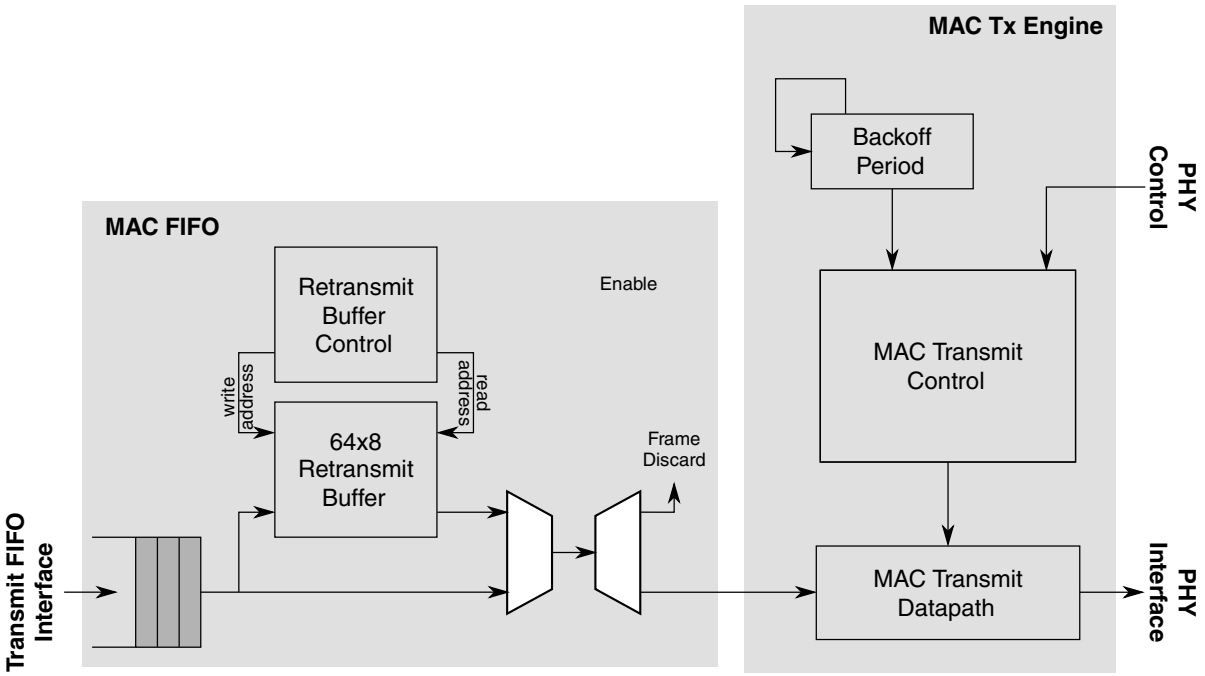

Figure 23-7. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$; where n is the number of retransmissions and $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by N = 10 as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET*n*_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

warning

Ethernet PHYs that support the SQE Test, or "heartbeat,"
feature must disable this feature. When this feature is enabled,

the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

23.6.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

23.6.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if ENET*n*_RCR[FCE] is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets ENET*n*_TCR[RFC_PAUSE].

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets RFC_PAUSE to zero.

If ENET*n*_RCR[FCE] cleared, the MAC ignores received pause frames.

Optionally and independent of ENET*n*_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

23.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET*n*_TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET*n*_OPD[PAUSE_DUR].

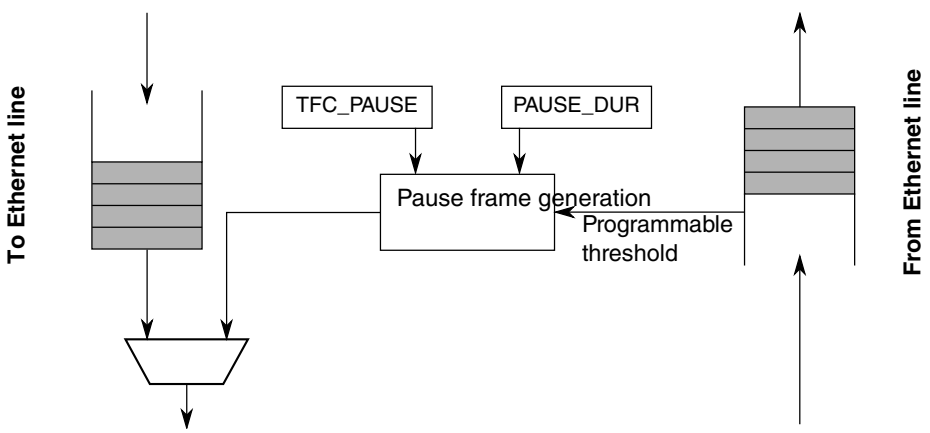

Figure 23-8. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

23.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

23.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET*n*_ECR[SLEEP]. At the same time ENET*n*_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, if ENET is enabled, write 1 to ENET*n*_ECR[SLEEP] before entering into low power mode.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

23.6.7.2 Magic packet detection

The core is designed to detect magic packets (see Magic packets) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

23.6.7.3 Wakeup

When a magic packet is detected, indicated by ENET*n*_EIR[WAKEUP], ENET*n*_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET*n*_ECR[MAGICEN], disabling magic packet detection.

23.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

23.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 23-26. IPv4 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
Zero		Protocol		TCP/UDP length			

Table 23-27. IPv6 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
TCP/UDP length							
Zero						Next header	

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

23.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

23.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET*n*_TACC and ENET*n*_RACC registers.

When enabled, the valid frame data is arranged as shown in Table 23-28.

Table 23-28. 64-bit interface data structure with SHIFT16 enabled

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0	

Table continues on the next page...

Table 23-28. 64-bit interface data structure with SHIFT16 enabled (continued)

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

23.6.8.3.1 Receive processing

When ENET*n*_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

23.6.8.3.2 Transmit processing

When ENET*n*_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

23.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET*n*_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX_FL
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (RX_ERR asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET*n*_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

23.6.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

23.6.8.6 IPv6 support

The following sections describe the IPv6 support.

23.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see 32-bit Ethernet payload alignment).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

23.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

23.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

23.6.9.1 Hardware reset

To reset the Ethernet module, set ENET*n*_ECR[RESET].

23.6.9.2 Soft reset

When ENET*n*_ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

23.6.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

23.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

23.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET*n*_TCR[GTS] is set by software.
- ENET*n*_TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see Sleep mode).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

23.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see Magic packet detection). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

23.6.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

23.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENET*n*_ECR[EN1588] to enable 1588 support.

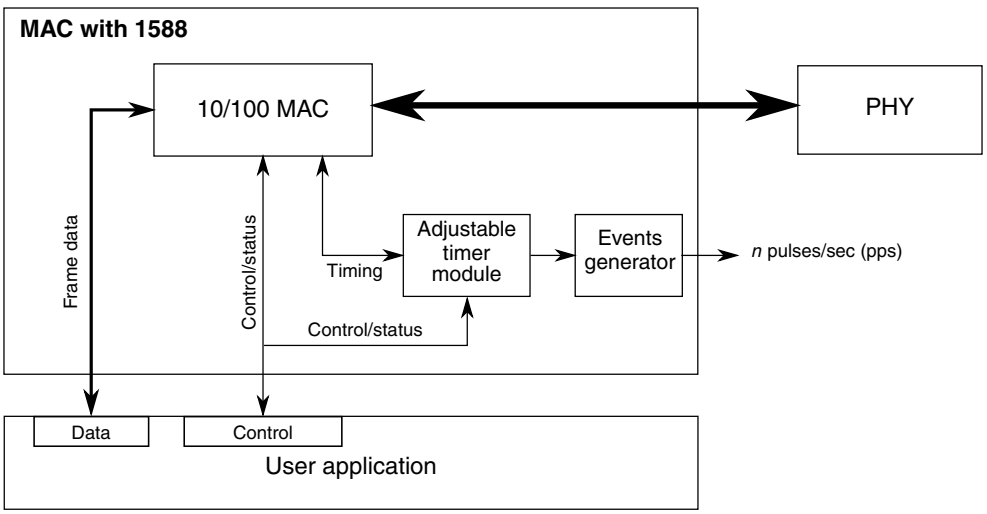

Figure 23-9. IEEE 1588 functions overview

23.6.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to (1×10^9)-1. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

23.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

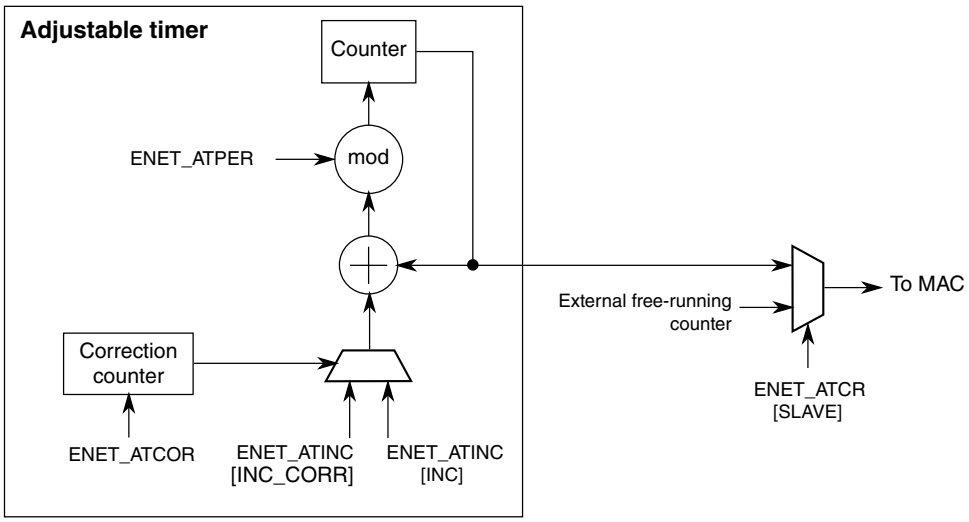

Figure 23-10. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET*n*_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET*n*_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc $-(1 \times 10^9)$), assuming the period is set to 1×10^9.

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET*n*_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET*n*_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET*n*_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET*n*_ATINC[INC] to the value of the master, since it is used for internal comparisons.

23.6.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET*n*_ATSTMP. ENET*n*_EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET*n*_EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET*n*_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

23.6.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

23.6.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to (1×10^9)–1. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9.

23.6.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

23.6.10.5.1 Input capture

The TCCR*n* capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR*n* signals. An event will cause the corresponding TCSR*n*[TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR*n*[TIE] field, an interrupt can be generated.

23.6.10.5.2 Output compare

The TCCR*n* compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR*n* register, the corresponding flag, TCSR*n*[TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR*n*[TIE], will be generated.The corresponding 1588_TMR*n* output signal will be asserted according to TCSR*n*[TMODE].

NOTE

If TSCR*n*[TMODE] is set to 10X1b or 1010b then the timer output pin toggle-on-overflow will occur only when PINPER, PEREN, and EN bits of the ATCR register are one.

23.6.10.5.3 DMA requests

A DMA request can be enabled by setting TCSR*n*[TDRE]. The corresponding DMA request is generated when the TCSR*n*[TF] timer flag is set. When the DMA has completed, the corresponding TCSRn[TF] flag is cleared.

23.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 512 words.

23.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

Table 23-29. Receive FIFO thresholds definition

Register	Description
ENET*n*_RSFL [RX_SECTION_FULL]	When the FIFO level reaches the ENET*n*_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET*n*_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again. If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted. To enable store and forward on the receive path, clear ENET*n*_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO. When programming a non-zero value to ENET*n*_RSFL (cut-through operation) it should be greater than ENET*n*_RAEM.
ENET*n*_RAEM [RX_ALMOST_EMPTY]	When the FIFO level reaches the ENET*n*_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. Set ENET*n*_RAEM to a minimum of six.
ENET*n*_RAFL [RX_ALMOST_FULL]	When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow. The corresponding error status is set when the frame is delivered to the application. Set ENET*n*_RAFL to a minimum of 4.
ENET*n*_RSEM [RX_SECTION_EMPTY]	When the FIFO level reaches the ENET*n*_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client. When the FIFO level goes below the value programmed in ENET*n*_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client. Clearing ENET*n*_RSEM disables any pause frame generation.

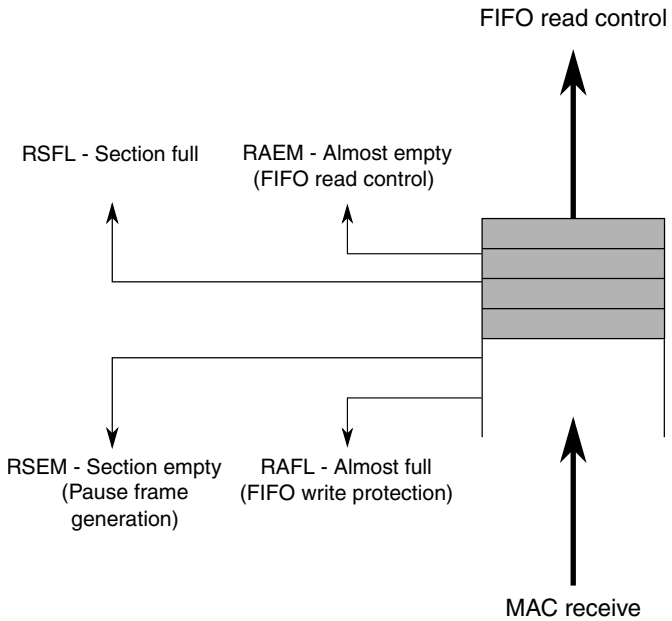

Figure 23-11. Receive FIFO overview

23.6.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 23-30. Transmit FIFO thresholds definition

Register	Description
ENET*n*_TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET*n*_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET*n*_TAEM to a minimum of 4.
ENET*n*_TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET*n*_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication. Set ENET*n*_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET*n*_TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET*n*_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET*n*_TSEM is 0, the signal is never deasserted.
ENET*n*_TFWR	When the FIFO level reaches the ENET*n*_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table 23-30. Transmit FIFO thresholds definition

Register	Description
	If a complete frame has a size smaller than the ENET*n*_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

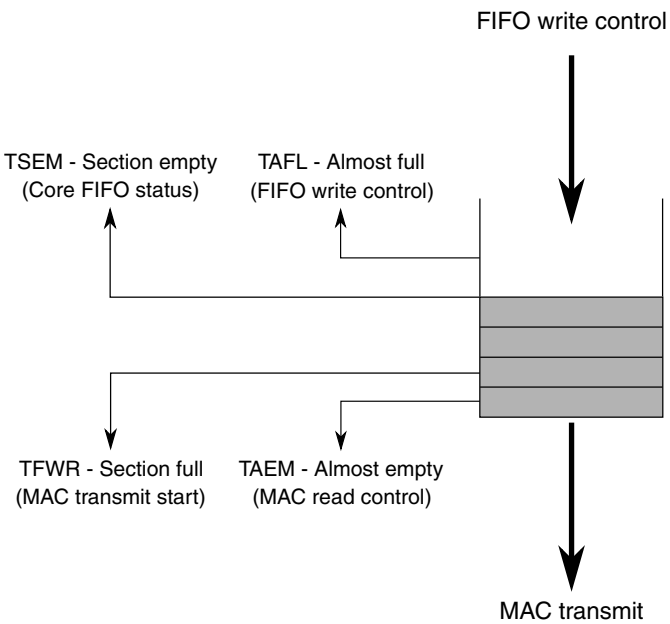

Figure 23-12. Transmit FIFO overview

23.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET*n*_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET*n*_RCR register fields:

Table 23-31. Loopback options

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces. In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))

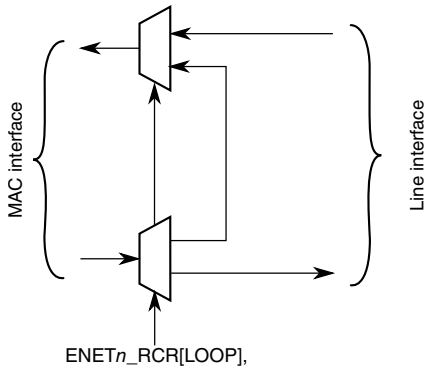

Figure 23-13. Loopback options

23.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous chips, legacy FEC buffer descriptors are available. To enable legacy support, write 0 to ENET*n*_ECR[1588EN].

NOTE

- The legacy buffer descriptor tables show the byte order for little-endian chips. DBSWP must be set to 1 after reset to enable little-endian mode.

23.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 23-35 contains the descriptions for each field.

Table 23-32. Legacy FEC receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1. This field is not supported by the uDMA.

23.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET*n*_ECR[1588EN].

NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. DBSWP must be set to 1 after reset to enable little-endian mode.

23.6.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. Table 23-35 contains the descriptions for each field.

Table 23-34. Enhanced uDMA receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 23-35. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
Offset + 2	15 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 2	14 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET*n*_RDSR.
Offset + 2	12 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	11 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 2	10–9	Reserved, must be cleared.
Offset + 2	8 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode.

Table continues on the next page...

Table 23-35. Receive buffer descriptor field definitions (continued)

Word	Field	Description
		The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	6 MC	Set if the DA is multicast and not BC.
Offset + 2	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	3	Reserved, must be cleared.
Offset + 2	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	1 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
0ffset + 6	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 16. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.
Offset + 8	15–6	Reserved, must be cleared.
Offset + 8	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	3	Reserved, must be cleared.
Offset + 8	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.
Offset + 8	1 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	0 FRAG	IPv4 Fragment.This is an accelerator option.This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.

Table continues on the next page...

Table 23-35. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + A	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	14–11	Reserved, must be cleared.
Offset + A	10 PE	PHY Error. This field is written by the uDMA. Set to "1"when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the *dma_int_rxb* / *dma_int_rxfevent*.
Offset + A	6–0	Reserved, must be cleared.
Offset + C	15–0 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + E	15–11 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + E	10–8	Reserved, must be cleared.
Offset + E	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		
Offset + 18 – Offset + 1E	15–0	Reserved, must be cleared.

Table 23-37. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	15–0 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	15 R	Ready. Written by the MAC and you. 0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 2	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.

Table continues on the next page...

Table 23-37. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 2	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	11 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame
Offset + 2	10 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 2	9 ABC	Append bad CRC. **Note:** This field is not supported by the uDMA and is ignored.
Offset + 2	8–0	Reserved, must be cleared.
Offset + 4	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller.
Offset + 8	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	14	Reserved, must be cleared.
Offset + 8	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.
Offset + 8	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set.
Offset + 8	7–0	Reserved, must be cleared.
Offset + A	15	Reserved, must be cleared.

Table continues on the next page...

Table 23-37. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + A	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	10–0	Reserved, must be cleared.
Offset + C	15–0	Reserved, must be cleared.
Offset + E	15–0	Reserved, must be cleared.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16		
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

23.6.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

23.6.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 23-38. FIFO interface data structure

	63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8
...	...							

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if ENET*n*_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET*n*_PAUR and ENET*n*_PALR registers.

Table 23-39. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address

Table continues on the next page...

Table 23-39. FIFO interface frame format (continued)

Byte number	Field
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 23-40. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

Note

The standard defines that the LSB of the MAC address is sent/ received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

23.6.15.2 Data structure examples

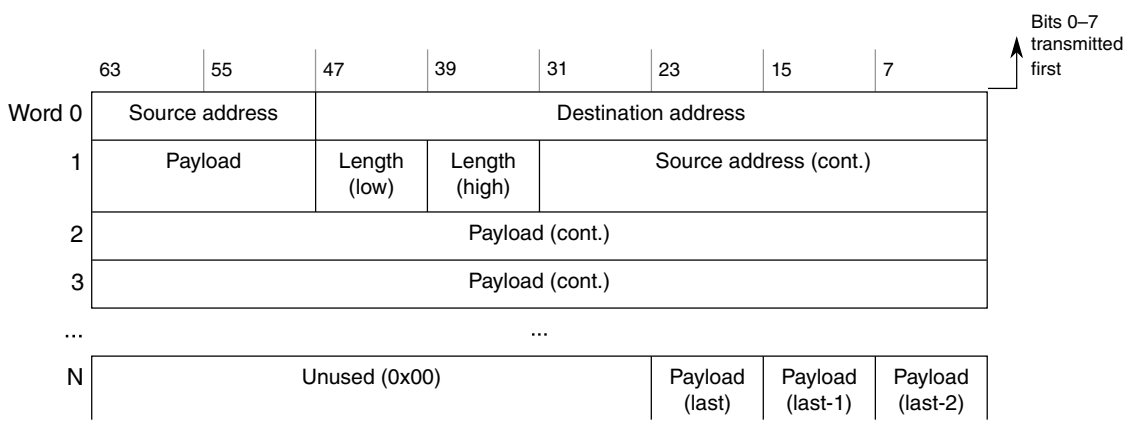

Figure 23-14. Normal Ethernet frame 64-bit mapping example

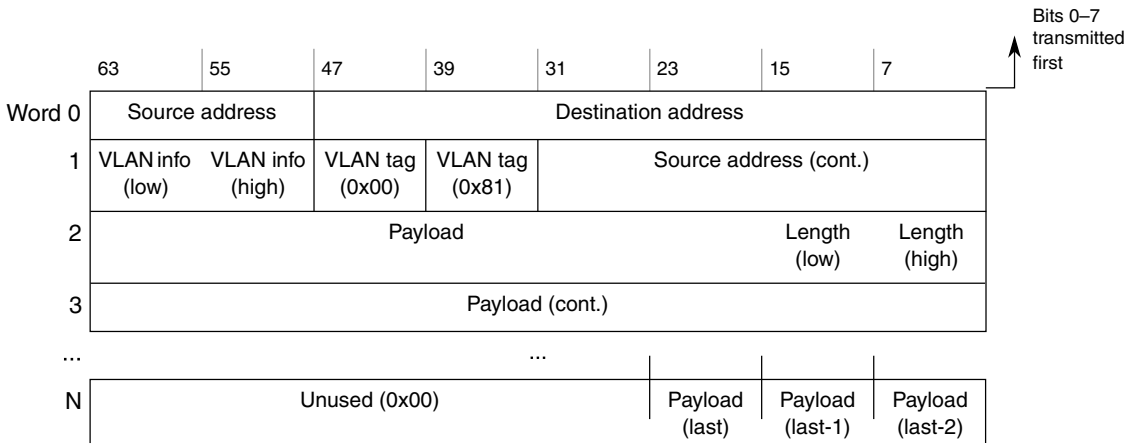

Figure 23-15. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

23.6.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See Enhanced buffer descriptors for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

23.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

23.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO

- Asserts the MII error signal (MII_TXER) (1 in Figure 23-16) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

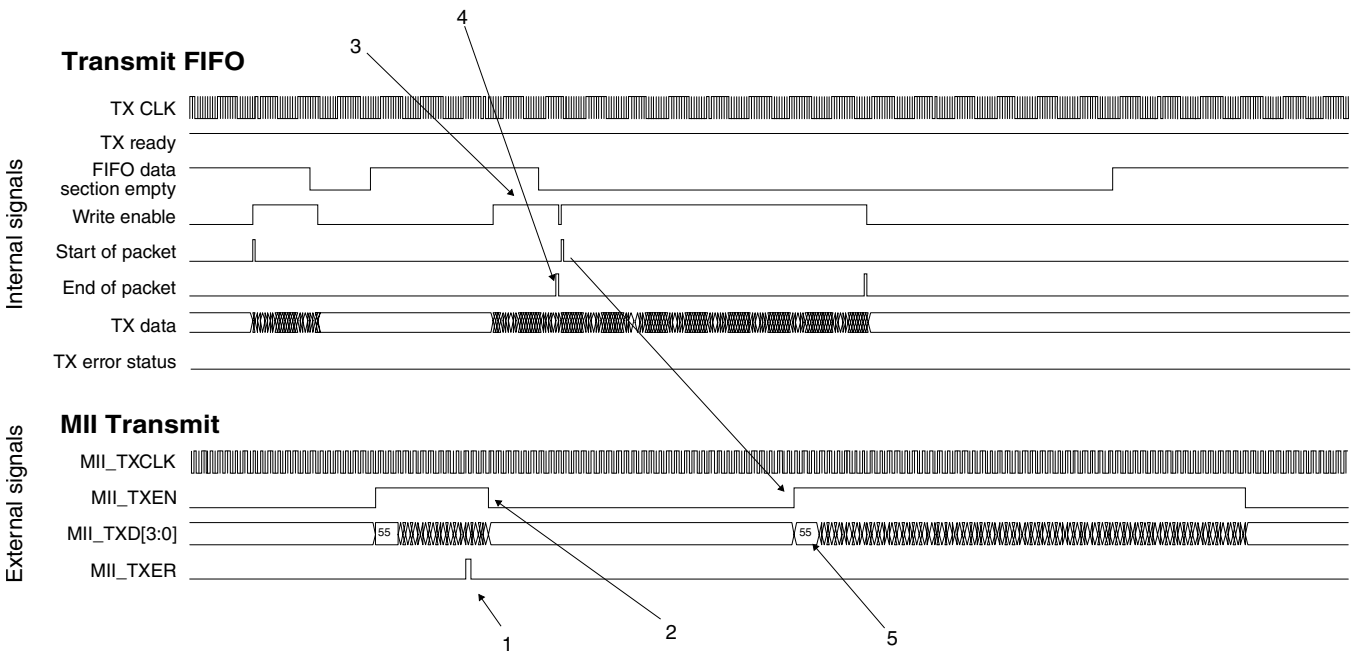

Figure 23-16. Transmit FIFO underflow protection

23.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurence.

Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET*n*_ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

23.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

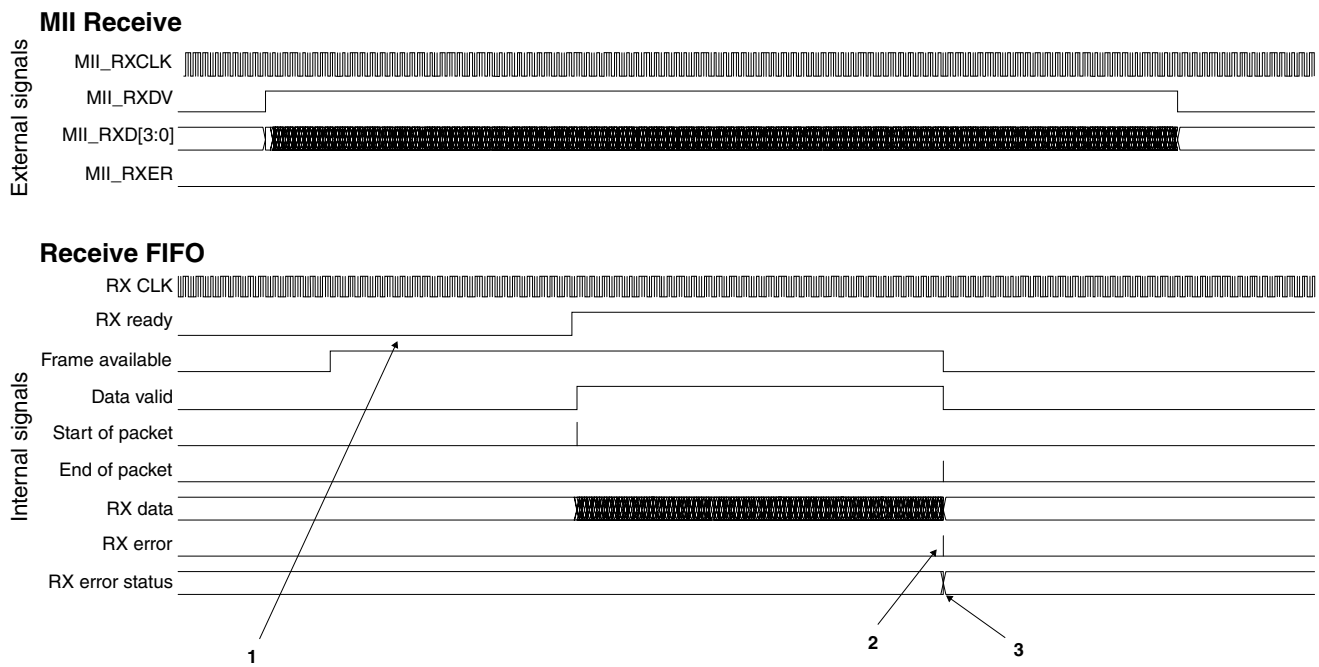

Figure 23-17. Receive FIFO overflow protection

23.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

23.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 23-41. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA

Table 23-42. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET*n*_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET*n*_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET*n*_MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET*n*_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET*n*_MMFR[DATA]. Written to or read from the PHY

23.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 23-43. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 23-44. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET*n*_MMFR[OP]. See Table 23-45 for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET*n*_MMFR[DATA], written to or read from the PHY.

Table 23-45. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

23.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET*n*_MSCR[MII_SPEED].

23.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET*n*_MMFR) according to the description provided in MII Management Frame Register (ENETn_MMFR).

To check when the programmed access completes, read the ENET*n*_EIR[MII] field.

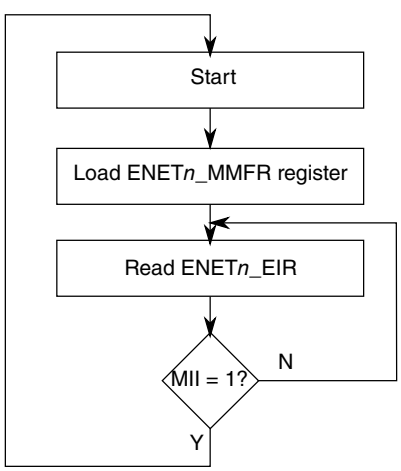

Figure 23-18. MDIO access overview

23.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets
- RGMII 10/100/1000 by way of interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SPEED]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMII_EN]
MII - 10 Mbit/s	0	—	0	0
MII - 100 Mbit/s	0	—	0	0
RMII - 10 Mbit/s	0	1	1	0
RMII - 100 Mbit/s	0	0	1	0
RGMII - 10 Mbit/s	0	1	0	1
RGMII - 100 Mbit/s	0	0	0	1
RGMII - 1000 Mbit/s[1]	1	—	0	1

1. Actual throughput is greater than 100 Mbit/s but significantly less than 1000 Mbit/s.

23.6.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

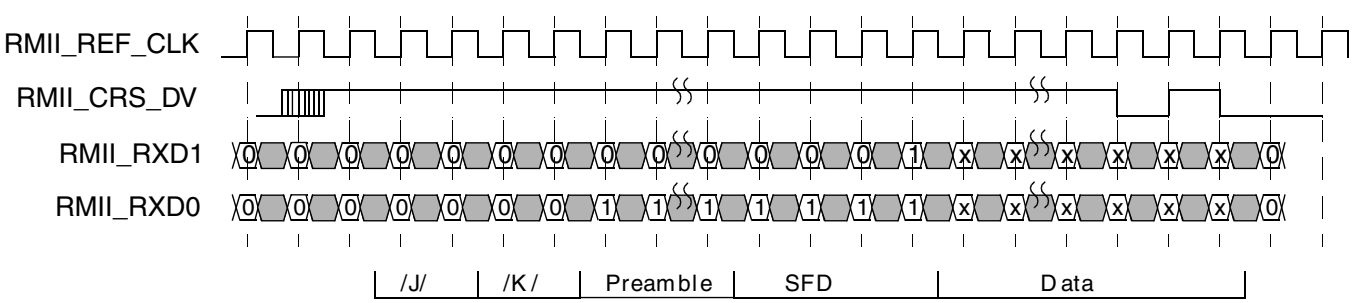

Figure 23-19. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

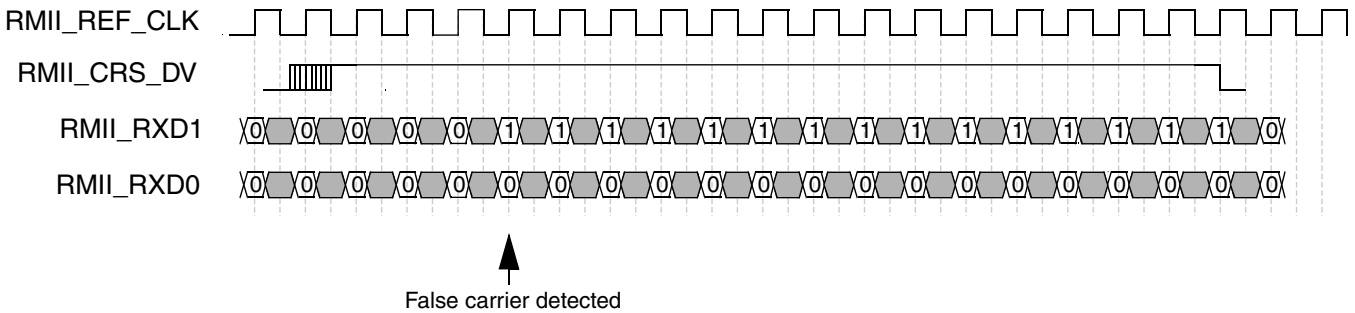

Figure 23-20. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

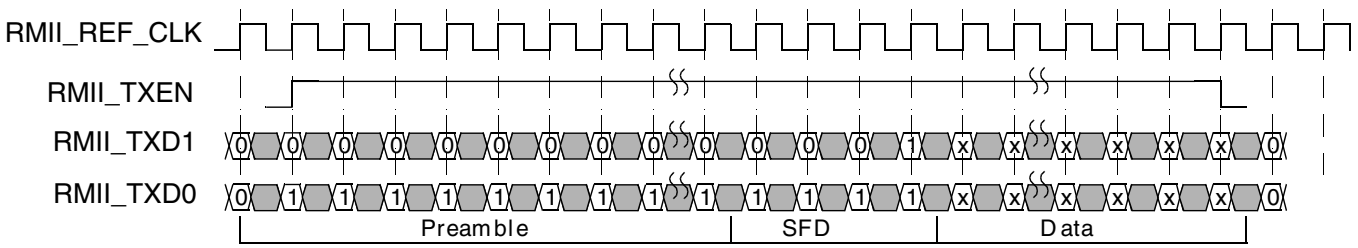

Figure 23-21. RMII transmit operation

23.6.18.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

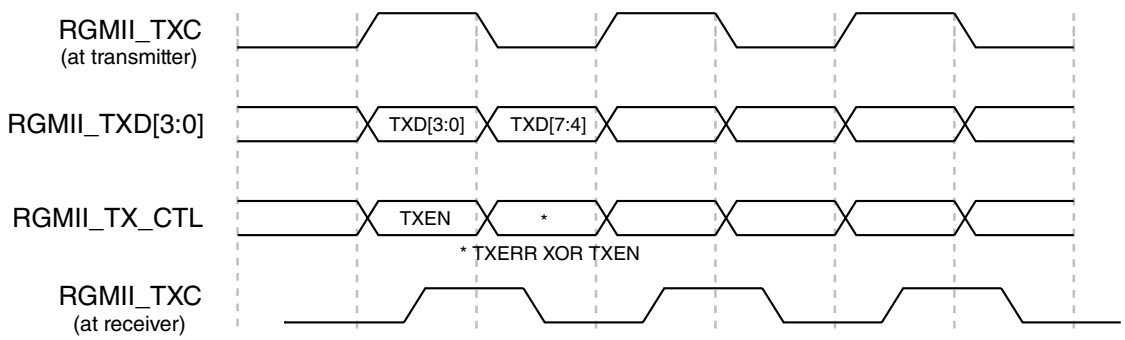

Figure 23-22. RGMII transmit operation

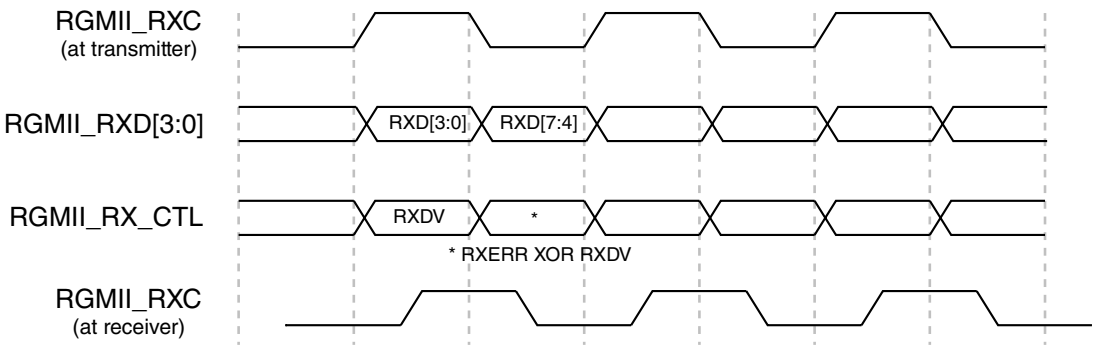

Figure 23-23. RGMII receive operation

23.6.18.3 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

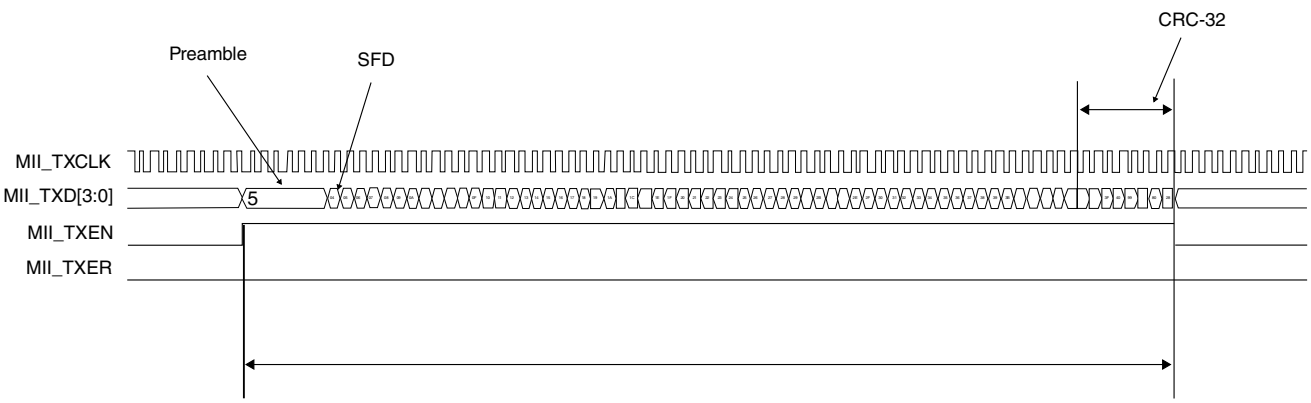

Figure 23-24. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

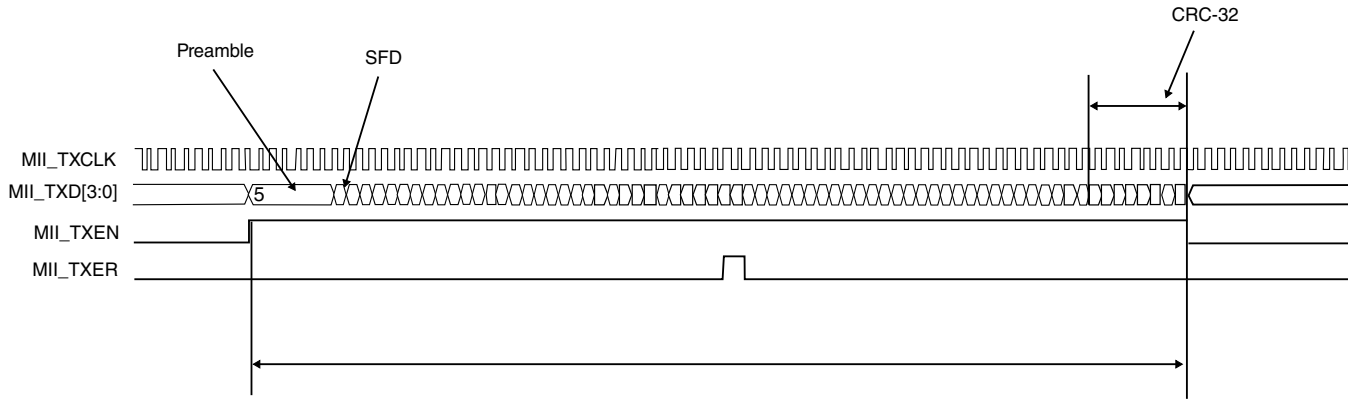

Figure 23-25. MII transmit operation — errored frame

23.6.18.3.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See Collision detection in half-duplex mode for details)

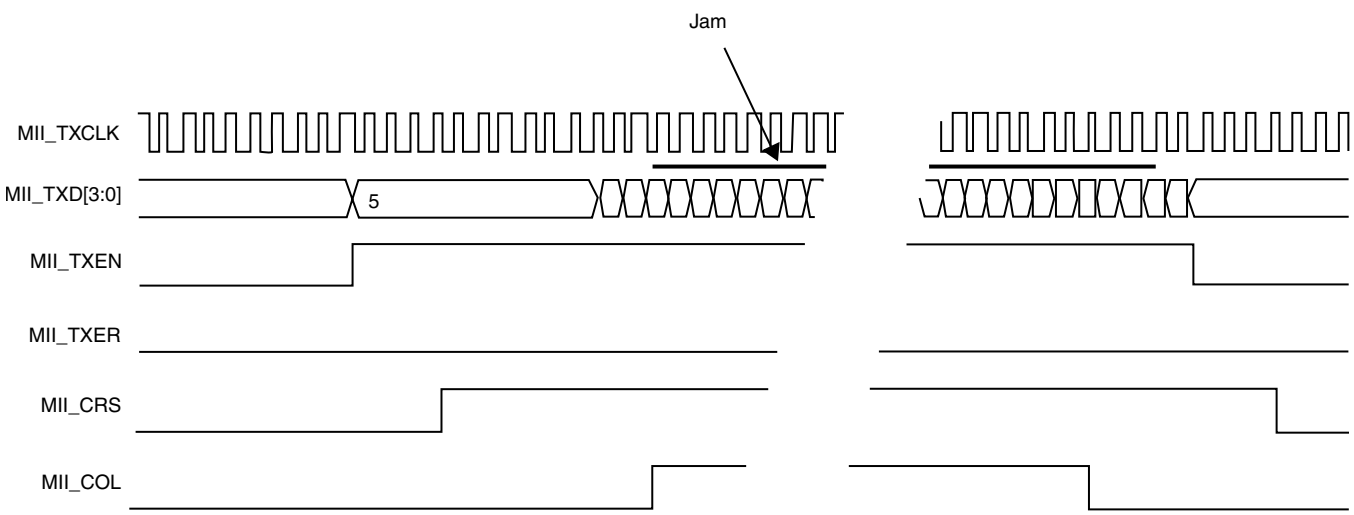

Figure 23-26. MII transmit operation — transmission with collision

23.6.18.4 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

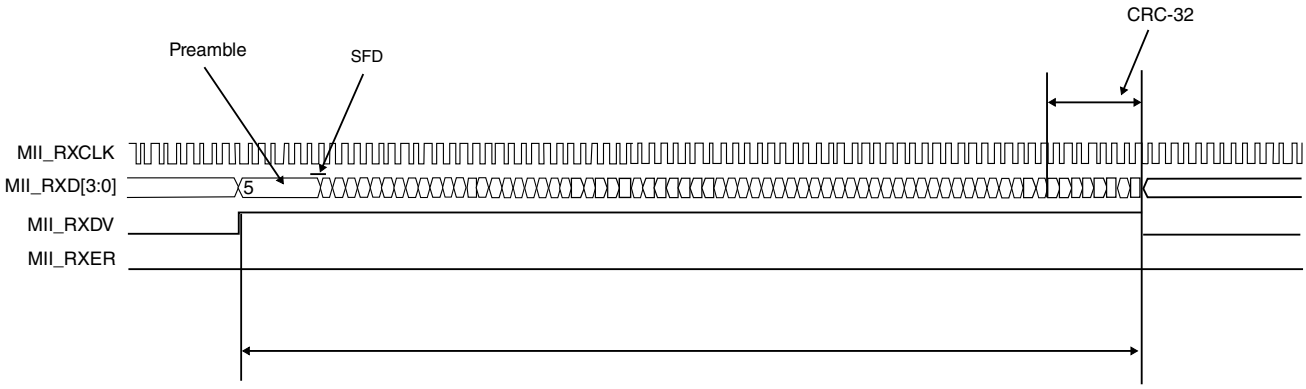

Figure 23-27. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

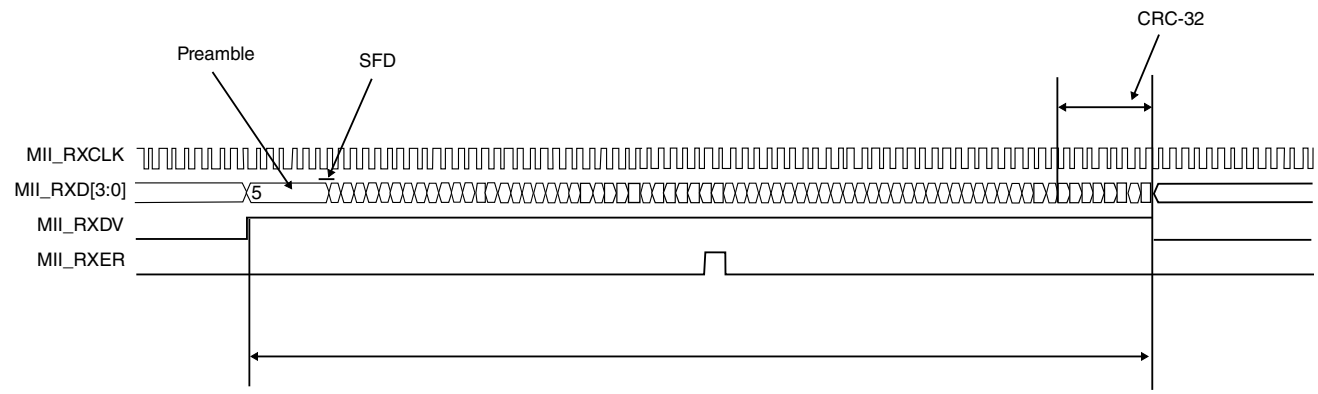

Figure 23-28. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

Chapter 24
Electrophoretic Display Controller (EPDC)

24.1 Overview

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK^{TM} EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Dual-scan TFT drive mode to support ultra high resolution/refresh rate displays
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking

- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan will multiple update requests
- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

24.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

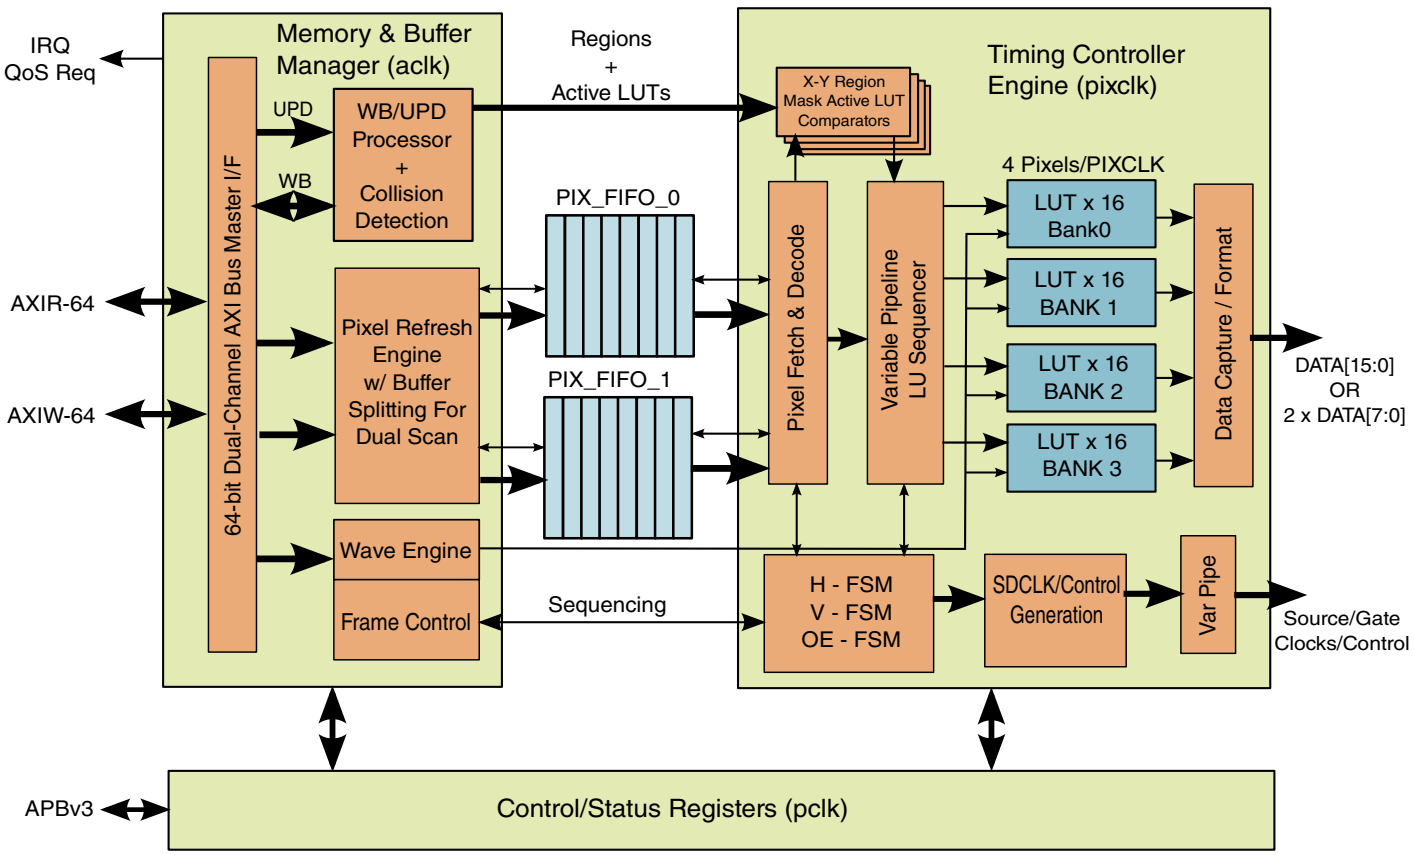

Figure 24-1. EPDC Top-Level Block Diagram

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- Memory and Buffer Manager (MBM): This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *aclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *aclk* too.
- Timing Control Engine (TCE): This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

24.2 External Signals

The following table describes the external signals of EPDC:

Table 24-1. EPDC External Signals

Signal	Description	Pad	Mode	Direction
EPDC_BDR0	Panel-Border Control (SW controlled)	EIM_DA2	ALT8	O
EPDC_BDR1	Panel-Border Control (SW controlled)	EIM_DA3	ALT8	O
EPDC_DATA00	Source Driver-Shift signal	EIM_A16	ALT8	O

24.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the ePXP IP) are described below.

24.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
- EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I^2C and 4-wire power sequencing signals.
- Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
- Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

24.3.2 Register Space (Write/Set/Clear/Toggle)

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

NOTE

Interrupt status bits (such as those contained in EPDC_IRQ) must be cleared with the clear address only. Writing to the EPDC_IRQ register with a 0 will not clear the interrupt status/ source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

24.3.3 Interrupts

24.3.3.1 Interrupt Sources

The EPDC contains 72 (64 of LUT completes IRQs and 8 of common IRQs) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC_IRQ /EPDC_IRQ1/EPDC_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC_IRQ* register is set by the EPDC. Each of the bits in EPDC_IRQ is first AND'ed with its enable bit (in EPDC_IRQ_MASK*), and then the masked bits are logically OR'ed together to generate the final output.

24.3.3.2 Enabling/Masking Interrupts

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC_IRQ_MASK* register.

Even if an interrupt source is masked out (IRQ_EN bit set to 0), its status will still be available in the EPDC_IRQ* register. The difference is that it does not result in the interrupt line being asserted.

24.3.3.3 Handling/Clearing Interrupts

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC_IRQ* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB_CMPLT_IRQ and LUT_COL IRQ fields of EPDC_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see Register Space (Write/Set/Clear/Toggle) for details).

When collision has occurred and the LUT_COL_IRQ bit is set, SW will handle the collision and clear LUT_COL_IRQ. Please note HW will also clear the entire EPDC_STATUS_COL* register at the sametime on LUT_COL_IRQ clearing by SW.

24.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

24.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC_WB_ADDR, must have EPDC_RES[HORIZONTAL] x EPDC_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
  - EPDC_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC_UPD_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
  a. when stride feature not enabled

    - EPDC_UPD_SIZE[HEIGHT] x EPDC_UPD_SIZE[WIDTH] bytes
    - Note that EPDC_UPD_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- WB-roundup4(EPDC_RES[HORIZONTAL]) x EPDC_RES[VERTICAL] x 2

24.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EDPC_RES, EPDC_FORMAT, EPDC_TCE_CTRL, EPDC_TCE_SDCFG and EPDC_TCE_GDCFG registers as follows.

- EPDC_RES:
    - HORIZONTAL: The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS_PER_SDCLK value. It also must be an integer multiple of the PIXELS_PER_CE value.
    - VERTICAL: The panel vertical resolution (in pixels). This can be any integer value.
- EPDC_FORMAT:
    - DEFAULT_TFT_PIXEL: This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution. This value must always correspond to the state the source driver should see when

no voltage change is needed. Incorrectly setting this value will damage the EPD material.

- TFT_PIXEL_FORMAT: This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.

- EPDC_TCE_CTRL:
  - SDDO_WIDTH: This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO_WIDTH would be set to 8-bit.
  - VCOM_MODE, VCOM_VAL: This VCOM_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM_VAL field, for panels which support VCOM modulation.
  - DDR_MODE: This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR_MODE = 1 and LVDS_MODE = 0.
  - LVDS_MODE: This mode always requires DDR_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS_MODE_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
  - LVDS_MODE_CE: When LVDS_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
  - DUAL_SCAN: Setting this field enables the dual scan function. When this field is set, all other parameters (except resolution) should be programmed in reference to each half of the panel. Because DUAL_SCAN modes require 2x the pixel-generation capability, there are limitations to the available TFT modes supported in this configuration (see Table 24-2 for details).
  - SCAN_DIR0, SCAN_DIR1: These fields determine the vertical scan direction of the panel.

    - SCAN_DIR0: Determines the vertical scan direction of the panel when DUAL_SCAN = 0. When DUAL_SCAN = 1, it determines the vertical scan direction of the top-half of the panel (0 means scan down and 1 means scan up).
    - SCAN_DIR1 only has meaning when DUAL_SCAN = 1. It defines the vertical scan direction of the bottom half of the panel.
  - PIXELS_PER_SDCLK: This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When DDR_MODE = 1, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See Table 24-2 for the required values per mode.
- EPDC_TCE_SDCFG:
  - SDCLK_HOLD: Holds the SDCLK low during the LINE_BEGIN time. The purpose of this field is to allow the user to set a LINE_BEGIN time which is not an integer multiple of SDCLKs (for fine tuning the line-time).
  - SDSHR: Defines the value of the SDSHR output signal which determines the source driver output order mapping.
  - NUM_CE: Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
  - PIXELS_PER_CE: This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.
  - SDDO_REFORMAT: This enumerated field allows for TFT-pixel level reordering within DATA. For most panels it is recommended to set SDDO_REFORMAT to the REVERSE_PIXELS enumeration.
  - SDDO_INVERT: When this field is set, the values on DATA are inverted relative to the values extracted from the waveform LUT operations.
- EPDC_TCE_GDCFG:
  - GDRL: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
  - GDOE_MODE: This field selects between two possible methods for driving the GDOE signal. When GDOE_MODE = 0, the GDOE output is always driven during the frame scan time, except during FRAME_SYNC when it is driven low. When GDOE_MODE = 1, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
  - GDSP_MODE: This field selects between two possible methods for driving the GDSP signal. When GDSP_MODE = 0, the GDSP signal is driven on the first

line clock time of the FRAME_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP_OFFSET control. When GDSP_MODE = 1, GDSP is active during the entire FRAME_SYNC time, and GDSP_OFFSET has not effect in this mode.

24.3.4.3 TFT Panel Timing Configuration

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.
- Arrive at a source driver clock frequency which in turn defines the exact pixclk frequency. In most cases, E-INK™ provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

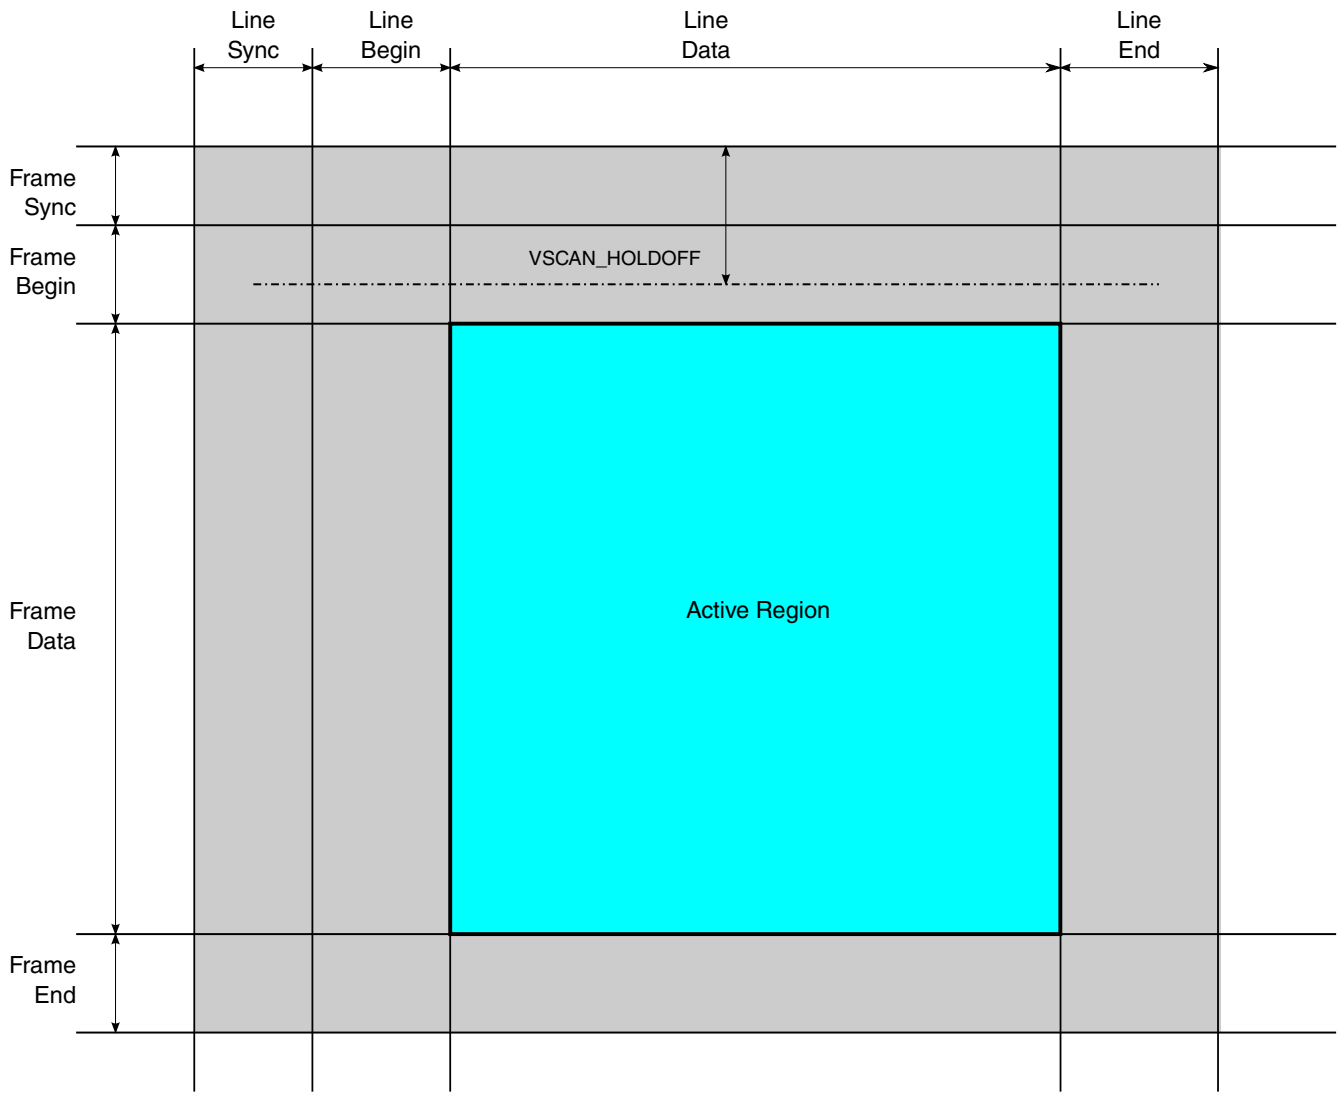

Figure 24-2. Frame Timing

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK\ (LS + LB + (HRES \times \left(\frac{Ratio}{PIXELSPERSDCLK}\right) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to Table 24-2 . A simple method to determine the ratio is as follows:

- When DDR_MODE = 1, RATIO = 4
- When DDR_MODE = 0
  - If PIXELS_PER_SDCLK = 8, RATIO = 4
  - Else, RATIO = 2

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

The following figure shows line timing for cases, where DDR_MODE = 0 (those cases where data is only sampled by the source driver on the rising edge of SDCLK). Depending on the mode (see Table 24-2), the ratio is a function of TFT pixel width and PIXELS_PER_SDCLK, so the timings are shown generically. For the purposes of this diagram, RATIO can either be 2 or 4.

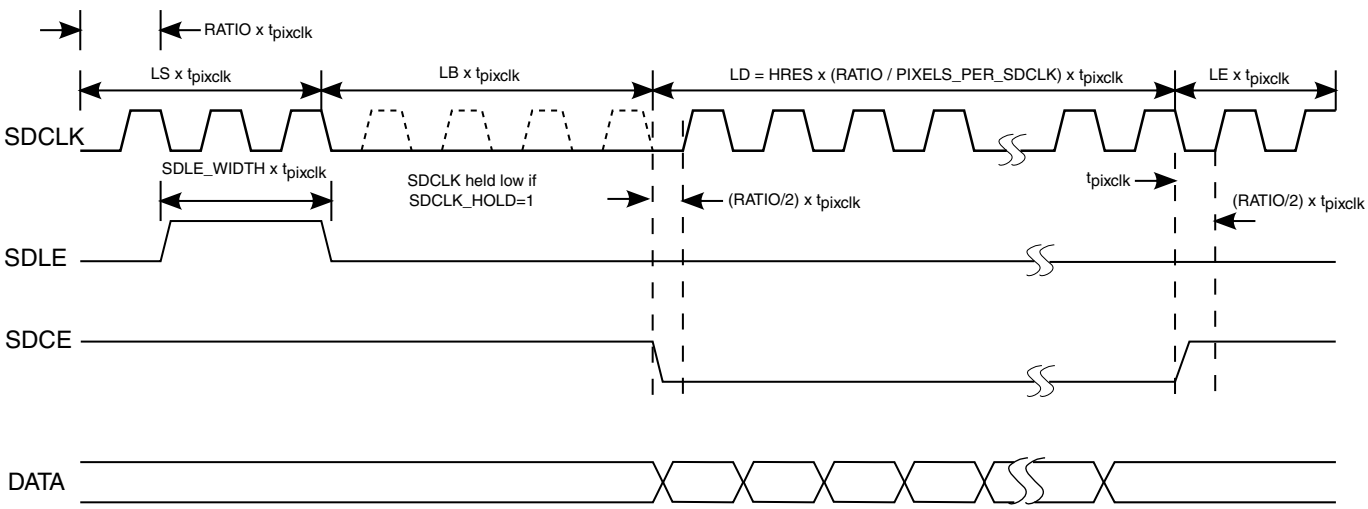

Figure 24-3. Line Timing (DDR_MODE = 0)

As per Table 24-2 , when DDR_MODE=1 (for example, for source drivers that require data to be driven on each edge of SDCLK), the RATIO is always set to 4. The timing for such cases is shown in the figure below.

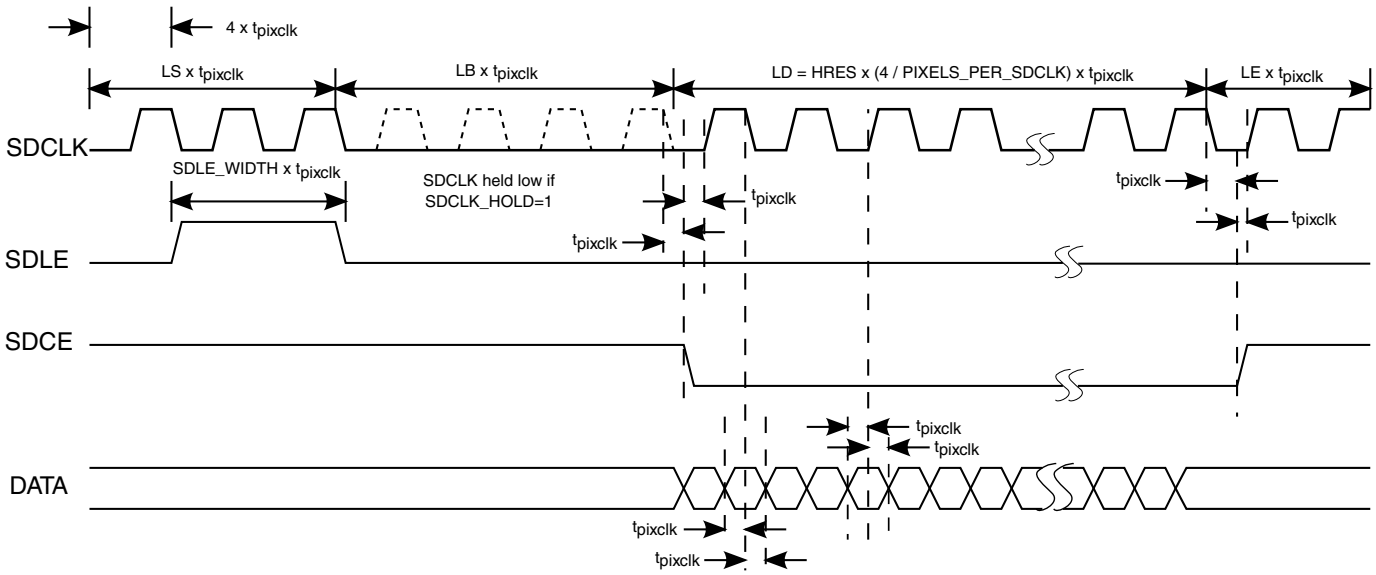

Figure 24-4. Line Timing (DDR_MODE = 1) - RATIO = 4

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in Figure 24-6. The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE_SYNC leading edge (this includes GDCLK_OFFSET, GDSP_OFFSET, and GDOE_OFFSET).
- GDSP_OFFSET is only supported for GDSP_MODE = 1
- For GDOE_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE_OFFSET value should be set at a value appropriately greater than GDCLK_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE_SYNC leading edge.
- The LINE_SYNC leading edge doesn't depend on the LINE_SYNC_WIDTH value. In cases where LINE_SYNC_WIDTH is set to some value that is less than LINE_SYNC, a virtual leading edge which determines the line start time still exists.

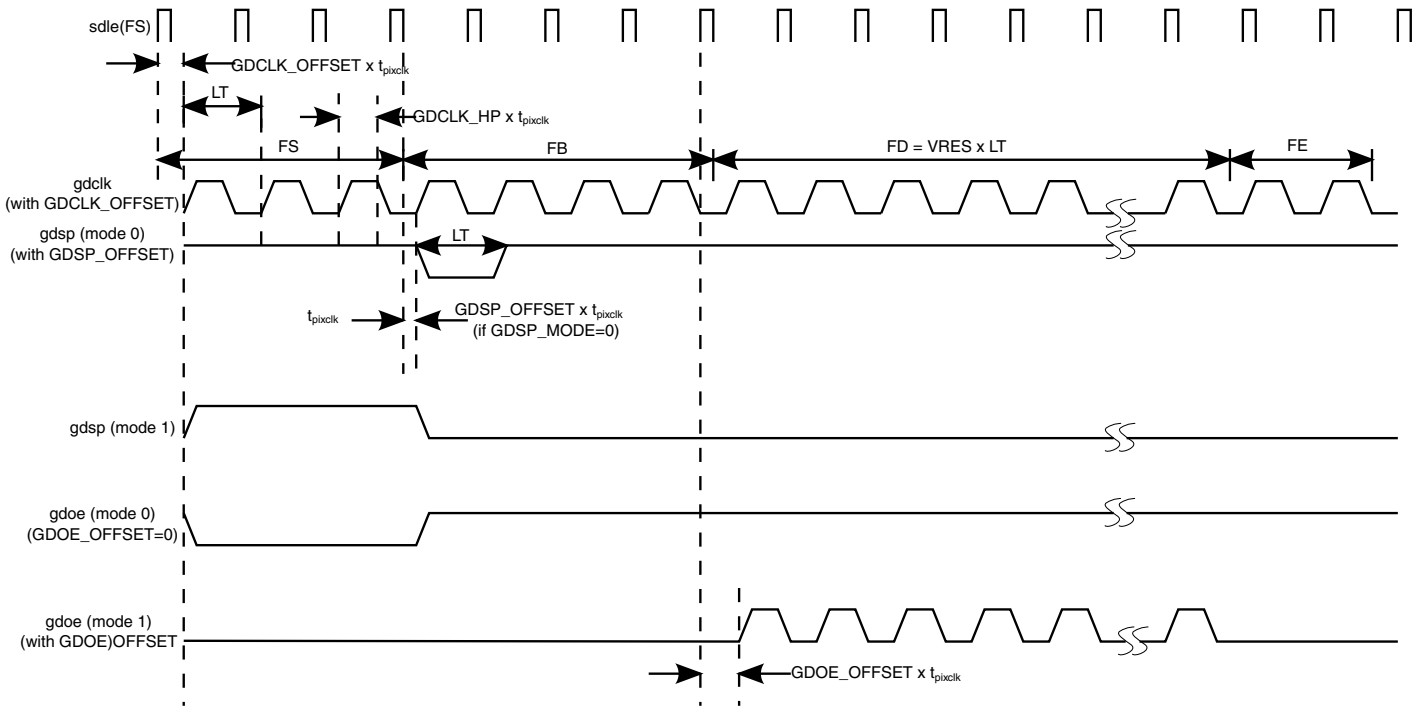

Figure 24-5. Frame Timing (Vertical)

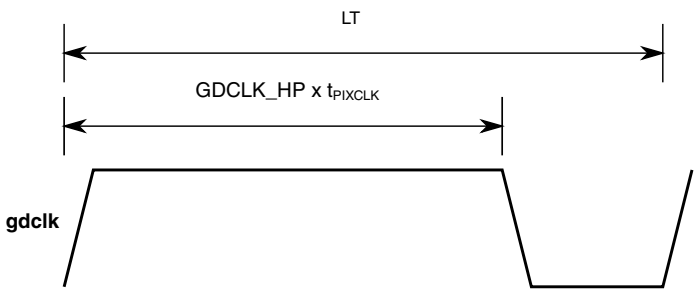

Figure 24-6. GDCLK Duty Cycle

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown as follows:

- PIXELS_PER_SDCLK = 4
- Ratio = 2 (2 bpp, 8-bit single-ended, SDR per Table 24-2)
- tPIXCLK = 17.64 MHz (assuming available chip clock frequency)
- LS = 20 x tPIXCLK
- LB = 8 x tPIXCLK
- LD = 800 x (2/4) x tPIXCLK = 400 x tPIXCLK
- LE = 142 x tPIXCLK
- LT = (20 + 8 + 400 + 142) x tPIXCLK = 32.31293 uS

LINE_SYNC_WIDTH does not affect line timing. It should be set to the same value as LINE_SYNC, unless LB and LE are short and it is used to shorten the width of SDLE whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312 uS. Then the frame-rate can be calculated and given the vertical timings:

- FS = 4 x LT
- FB = 4 x LT
- FD = 600 x LT
- FE = 10 x LT
- FT = (4 + 4 + 600 + 10) x LT = 50.07665 Hz

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through HW_EPDC_TCE_TIMING2[GDCLK_HP], or GDCLK High-Pulse time.

24.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

Table 24-2. Interface Modes

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SDCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
Single Scan	2bpp, 8-bit single-ended, SDR	0	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 16-bit single-ended, SDR	0	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
	2bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	2B[V]	EIGHT	1|0	1	8BIT	SDCLK x 4

Table continues on the next page...

Table 24-2. Interface Modes (continued)

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SDCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
	4bpp, 8-bit single-ended, SDR	0	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 16-bit, single-ended SDR	0	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2
	4bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	4B[V]	FOUR	1|0	1	8BIT	SDCLK x 4
	4bpp, 16-bit, single-ended, DDR	0	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4
Dual Scan	2bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 8-bit, DDR	1	[7:0],[15:8]	2B[V]	EIGHT	0	1	8BIT	SDCLK x 4
	4bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 8-bit, DDR	1	[7:0],[15:8]	4B[V]	FOUR	0	1	8BIT	SDCLK x 4

24.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

24.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC_WB_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in Memory Requirements.

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

24.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW_EPDC_UPD_CTRL[UPDATE_MODE] must be set to FULL
- HW_EPDC_UPD_CTRL[WAVEFORM_MODE] must be set to the INIT waveform (typically 0x00)

- HW_EPDC_UPD_CTRL[USE_FIXED] must be set
- HW_EPDC_UPD_FIXED[FIXNP_EN], FIXCP_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of HW_EPDC_UPD_FIXED allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

24.3.5 Dual-Scan Configuration

The EPDC supports ultra-high resolution/refresh rate EPD panels.

At certain resolutions/refresh rates, there exist electrical limitations of the TFT devices and TFT driver ICs such as source drivers. In order to support driving such displays, the EPDC supports the dual-scan driver method.

The specific method involves driving a TFT configuration where there are two sets of source drivers. All source driver control signals are expected to be shared across all source drivers (except the SDCE signals unless a unified CE is presented by the panel).

In this mode, EPDC_DATA[7:0] is reserved to drive the upper half of the display and EPDC_DATA[15:8] is reserved to drive the lower half of the panel. The update and working buffers do not have to be aware of the dual-scan operation because the MBM knows how to access the WB for refresh operations based on the settings of the EPDC_TCE_CTRL[SCAN_DIR_0,1]. The EPDC supports four scan configurations for dual-scan which are shown in the following figures. Each figure shows an example configuration (that is to say, the EPDC is not limited to the support of only 2 source drivers per side).

The dual-scan drive method allows the SDCLK frequency to be halved relative to a single-scan method for the same resolution and refresh rate. In addition to this, each TFT is only charged in half frequency (for any given SDCLK cycle, twice as many pixels are being driven per frame scan).

Because all 16 DATA signals must be utilized for dual-scan, there is no support for the LVDS_MODE. The supported source-driver modes for dual scan are shown in Table 24-2. For the 2bpp DDR mode, the EPDC is capable of generating a total of 16 pixels per SDCLK cycle.

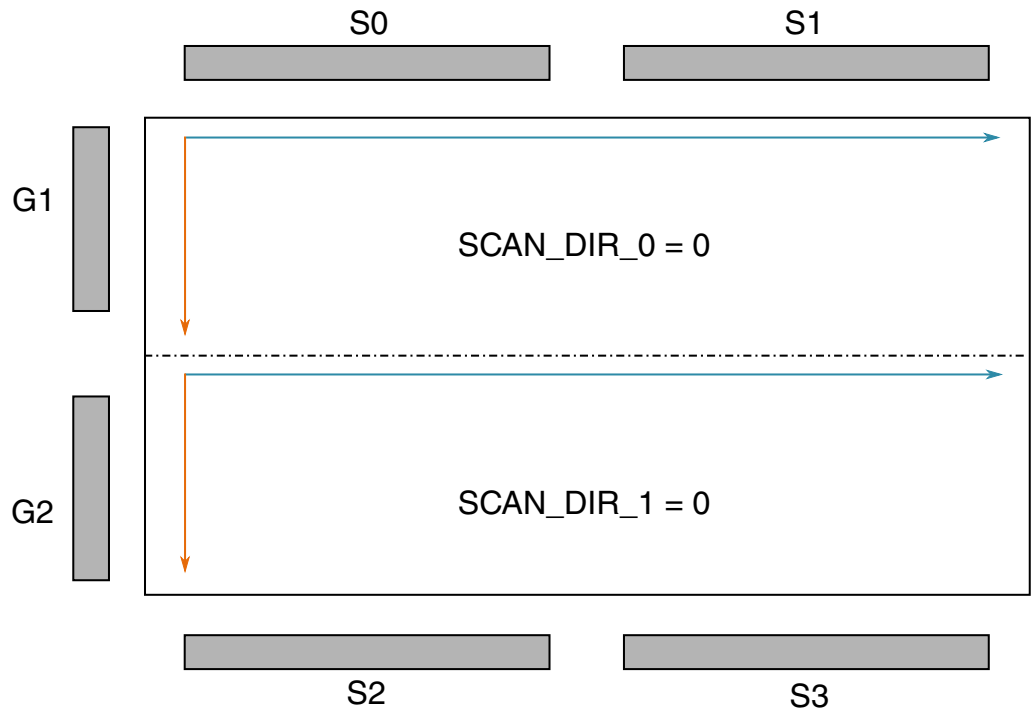

Figure 24-7. Dual-Scan Method (Scan = 00)

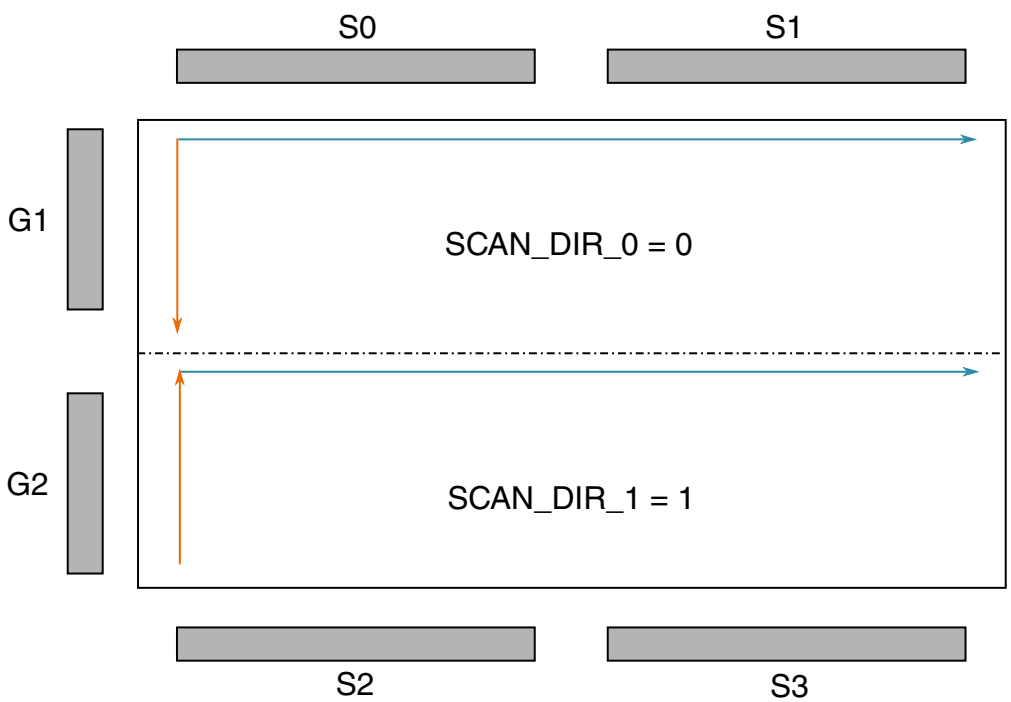

Figure 24-8. Dual-Scan Method (Scan = 01)

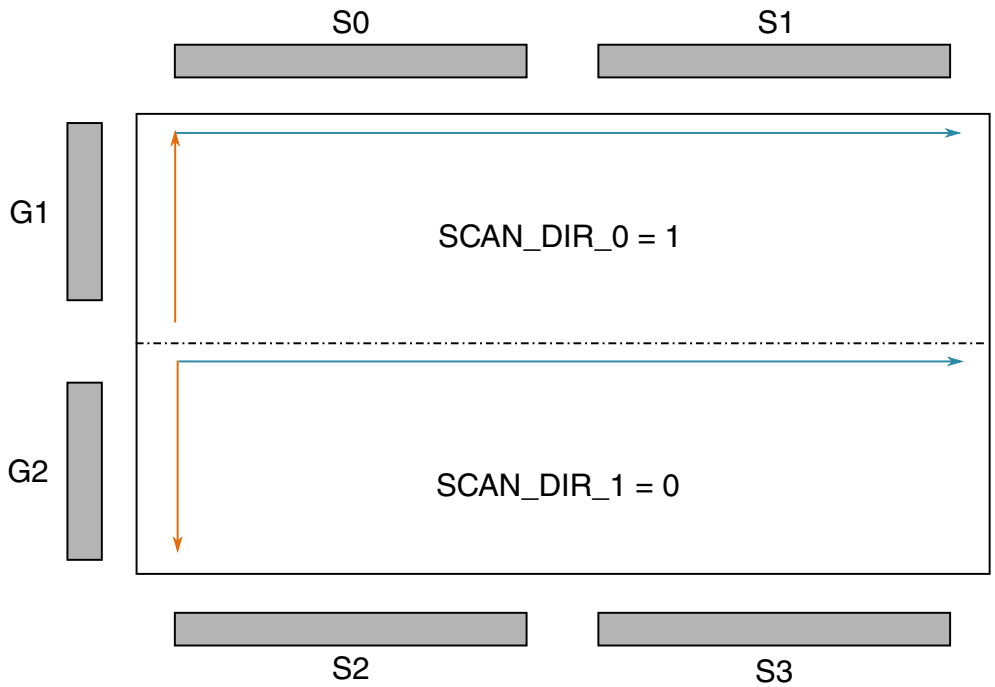

Figure 24-9. Dual-Scan Method (Scan = 10)

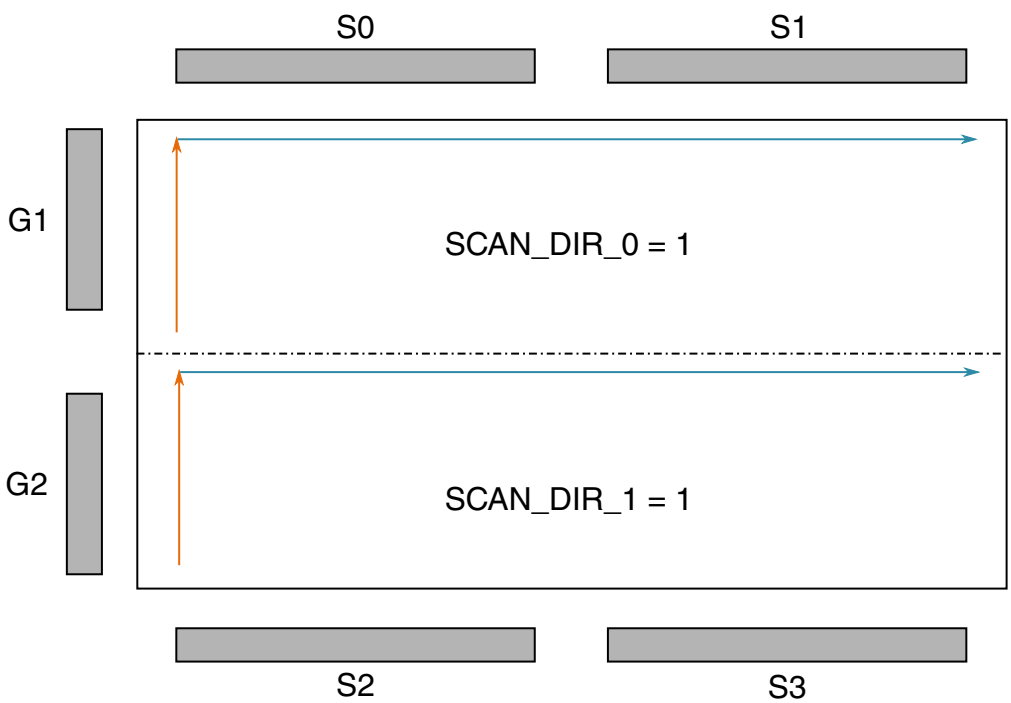

Figure 24-10. Dual-Scan Method (Scan = 11)

24.3.6 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

- **Collision Rectangle Detection**

  For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

  When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submited.

  Details of minimal collision rectangle reported in UPD_COL_CORD/ UPD_COL_SIZE.

- **Grey Level Detection (histogram)**

  This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)_PARAM registers before using this functionality.

- **Dry-Run Mode**

  Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD_CTRL[DRY_RUN] = 1 when writing UPD_CTRL register.

  In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

  Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by UPD_CTRL[LUT_SEL] is not used here; the user can start this dry-run update when no LUTs are available.

24.3.7 Waveform Mode Selection (AUTOWV)

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV_LUT register with AUTOWV_LUT[ADDR]="grey level", AUTOWV_LUT[DATA]="waveform mode" for each possible grey level reported by the EPDC histogram.

After AUTOWV_LUT is programmed, AUTOWV mode can be enabled by setting UPD_CTRL[AUTOWV]=1. When enabling AUTOWV, the waveform mode written into UPD_CTRL[WAVEFORM_MODE] will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into UPD_CTRL[WAVEFORM_MODE].

If the user also sets UPD_CTRL[DRY_RUN], EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the UPD_CTRL[AUTOWV_PAUSE] setting:

1. UPD_CTRL[AUTOWV_PAUSE] = 0, AUTO MODE)

   EPDC will begin waveform loading immediately without any software interaction

2. UPD_CTRL[AUTOWV_PAUSE] = 1, MANUAL MODE)

   EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into UPD_CTRL with final waveform mode, and waveform loading then panel scan will start.

24.3.8 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legecy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4
- PIGEON[05] - SDCE5
- PIGEON[06] - SDCE6
- PIGEON[07] - SDCE7
- PIGEON[08] - SDCE8
- PIGEON[09] - SDCE9
- PIGEON[10] - SDOE

Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC_SEL
3. Count and match SET_CNT: assert signal, reset counter

   (SET_CNT==0 means assert immediately on MASK's rising edge)

4. Count and match CLR_CNT: de-assert signal, stop counter

   (CLR_CNT==0 means de-assert on MASK's falling edge)

NOTE

When local counter is running, further changes to MASK are not cared unless CLR_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

   8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

   For example, for a line timing signal start on Line Begin phase during Frame Begin/ Frame Data lines, use the configuration below:

Table 24-3. STATE_MASK combinations

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK_CNT/MASK_CNT_SEL(global counter)

   Sometimes a more accurate reference point is required, such as" line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK_CNT_SEL, when global counter matches the MASK_CNT value. The pigeon local counter will start ticking.
3. Use another pigeon signal as mask (SIG_LOGIC=MASK)

   For some tightly coupled signals it is possible to use one as a reference to generate another.

INC_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global Counters (selectable through MASK_CNT_SEL)

- HCNT / VCNT

  normal pclk counter / line counter
- HSTATE_*CNT* / VSTATE_*CNT*

  similar to above, but reset when state changes
- HSTATE_*CYCLE* / VSTATE_*CYCLE*

  (see figure below for definition of CYCLE/PERIOD/CNT)

  Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use HW_EPDC_PIGEON_CTRL.*_PERIOD to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK_CNT to generate mask for CE[n].
- FRAME_*CNT* / FRAME_*CYCLE* (only for frame-crossing signals)

  frame cycle counter doesn't have a reset condition; use HW_EPDC_PIGEON_CTRL1.FRAME_CNT_CYCLES to reset it.

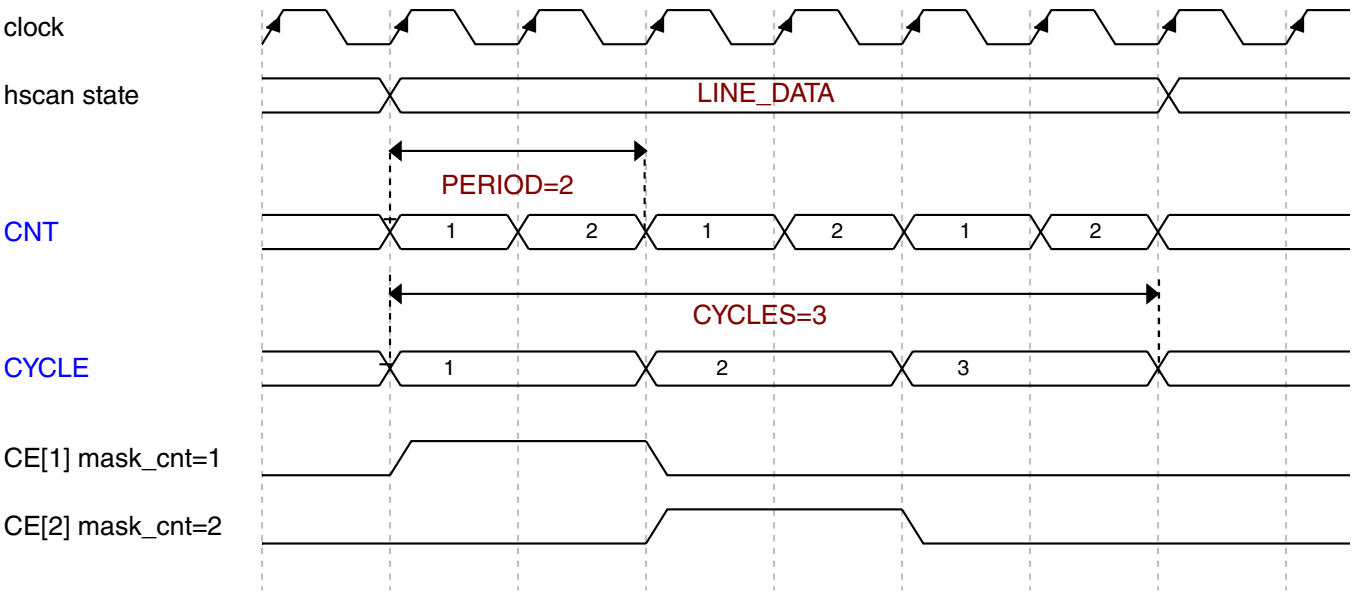

Figure 24-11. Definition of CNT, CYCLE, PERIOD

The following are register settings for the figure above:

- HW_EPDC_PIGEON_CTRL0.LD_PERIOD=2
- MASK_CNT_SEL = 1 // HSTATE_CYCLE
- MASK_CNT = 1 // CE[1]
- MASK_CNT = 2 // CE[2]

24.3.9 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

24.3.9.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- EPDC_STATUS[WB_BUSY] must be 0. The EPDC cannot process new updates if it is currently processing an update.
- EPDC_STATUS[LUTS_BUSY] must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to EPDC_UPD_CTRL which initiates the display update).

The following steps can be performed before WB_BUSY and LUTS_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC_TEMP.
- EPDC_UPD_ADDR must be set to the 8-bit buffer for the update. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see Memory Requirements for details).
- EPDC_UPD_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC_UPD_SIZE defines the dimension of the update (pixels).
- EPDC_UPD_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC_UPD_CTRL register initiates a display update:

- USE_FIXED-This field is set when EPDC_UPD_FIXED is used.
- LUT_SEL-The driver should read EPDC_STATUS_NEXLUT[NEXT_LUT] (qualified by NEXT_LUT_VALID) to select an available LUT to assign this update.
- WAVEFORM_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE_MODE selects one of two enumerated updated modes.
  - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
  - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC_FORMAT[DEFAULT_TFT_PIXEL] is applied to the pixels which are not changing.

24.3.9.2 Update Processing and Collisions

After the update is initiated (by writing EPDC_UPD_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB_CMPLT_IRQ interrupt. If a collision is detected, the LUT_COL_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC_UPD_CTRL. After this process is initiated, a waveform takes an amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are refered to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray

overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available can be assigned) and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

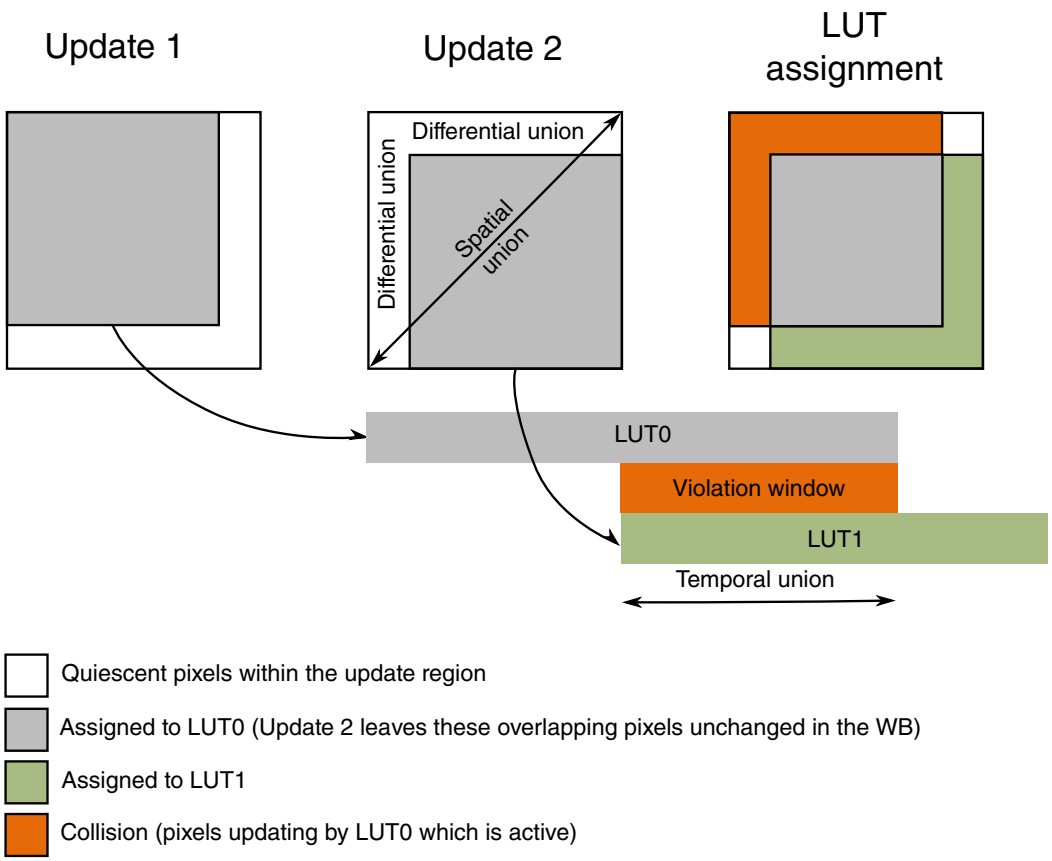

Figure 24-12. Partial Update Collision Handling

NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT_COL_IRQ interrupt status bit (this will always happen in conjunction with WB_CMPLT_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB_CMPLT_IRQ but also for the LUT_COL_IRQ status bit within the EPDC_IRQ register. If LUT_COL_IRQ is set, this means that a

collision has occurred. If this is the case the driver should check the value of the EPDC_STATUS_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC_IRQ[LUTn_CMPLT_IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC_STATUS_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC_STATUS_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

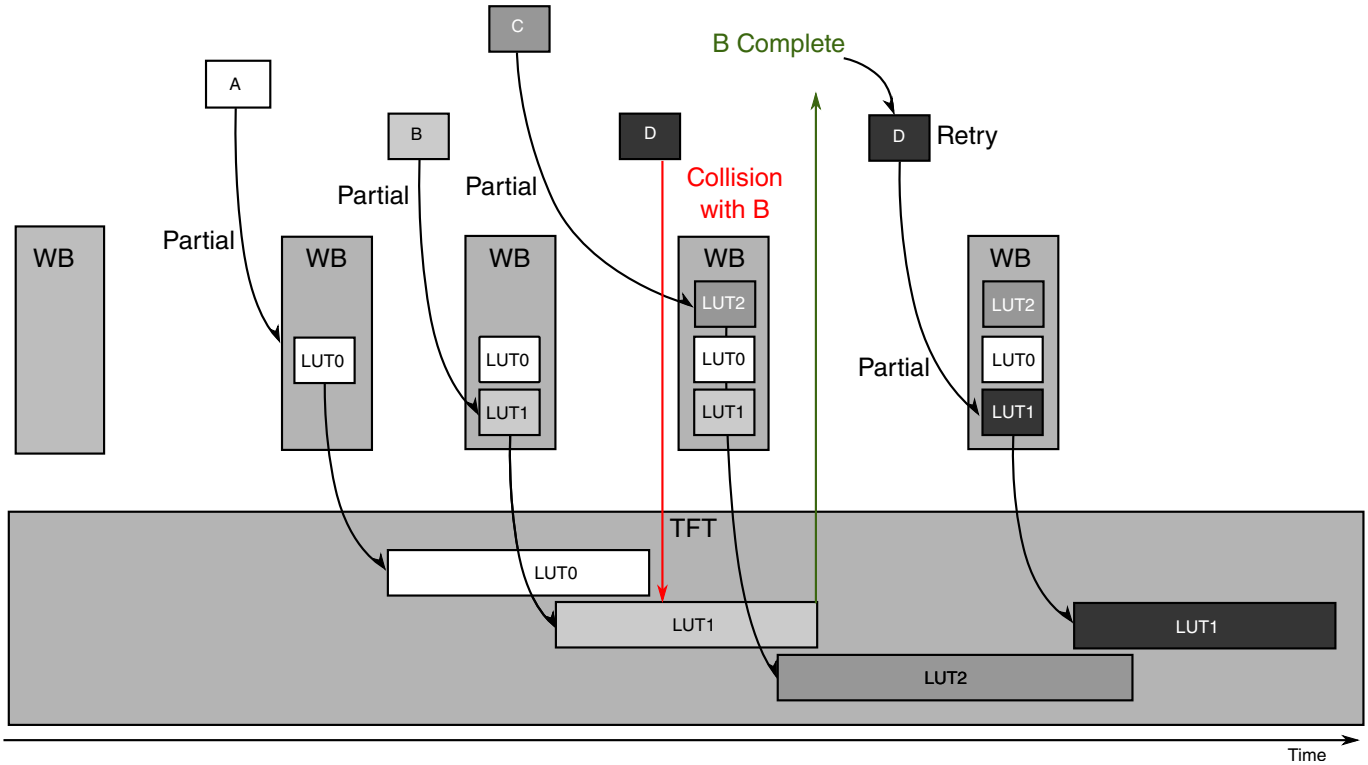

Figure 24-13. Collision Sequence

24.3.9.3 Multiple Update Flow

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in Initiating a Display Update, there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

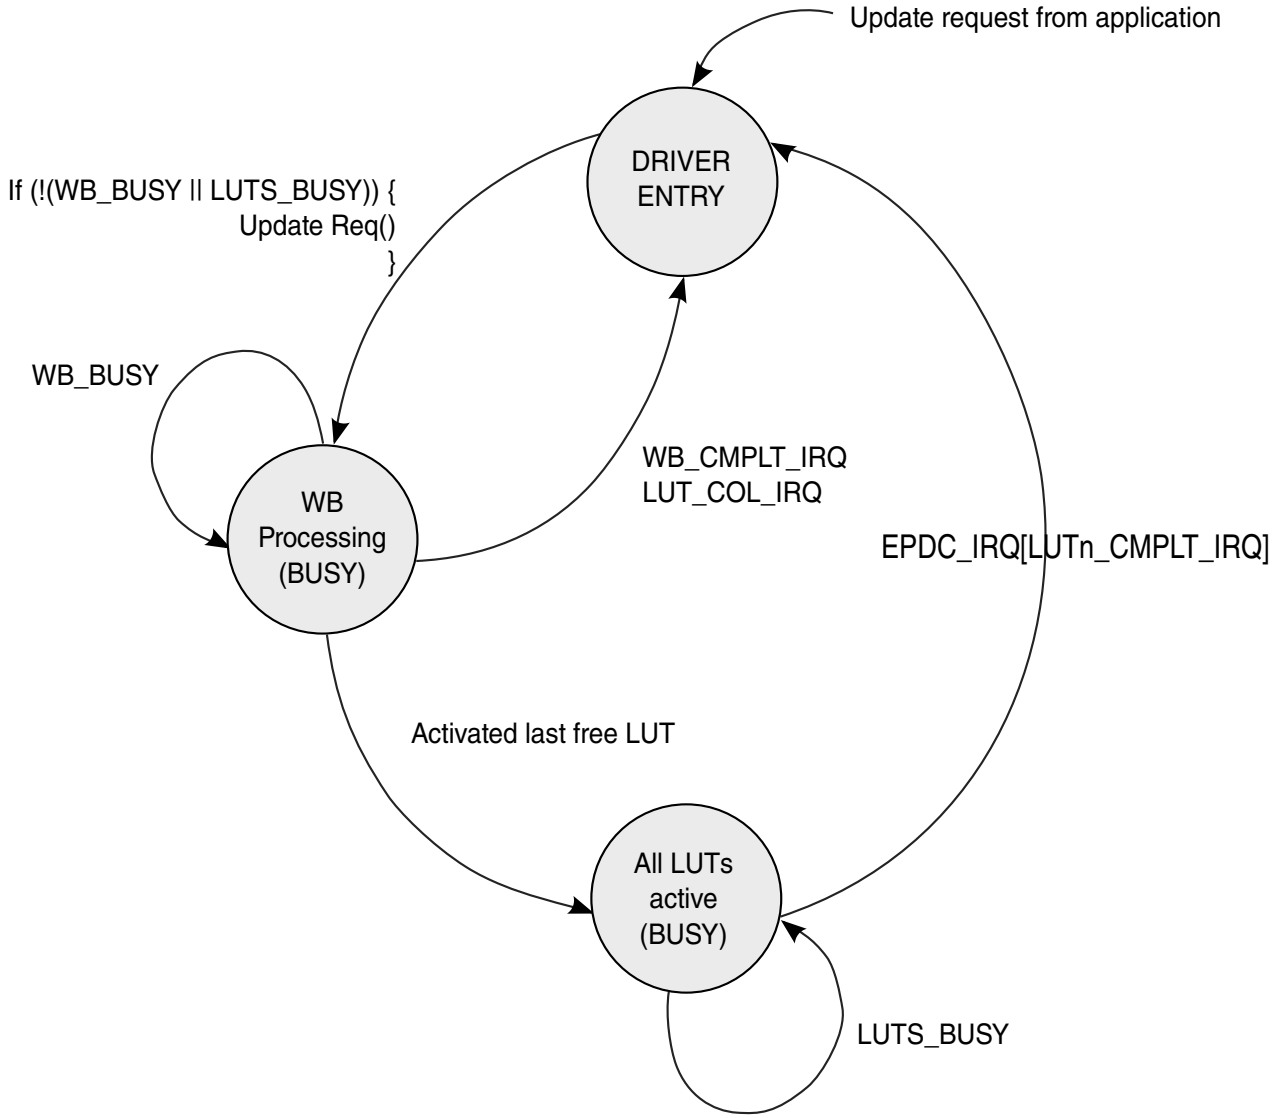

Figure 24-14. Driver Update Flow

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the WB_CMPLT_IRQ interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as Update_Req() in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a WB_CMPLT_IRQ interrupt issued, but the driver at that time would be in a busy state (because LUTS_BUSY is signaled). The driver will be re-entered on the next LUTn_CMPLT_IRQ interrupt during which time it can issue a new update (since WB_BUSY and LUTS_BUSY status bits are low).

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB_BUSY status and the state of the screen update. In contrast, the LUTn_CMPLT_IRQ interrupt status and EPDC_STATUS_LUTS provide the status of the physical waveform update. This means that when LUTn_CMPLT_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC_UPD_CTRL to EPDC_IRQ[WB_CMPLT_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB_BUSY and LUT_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC_STATUS_LUTS[LUTn_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not being commenced until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC_TCE_CTRL[VSCAN_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC_IRQ[TCE_UNDERRUN_IRQ] will fire.

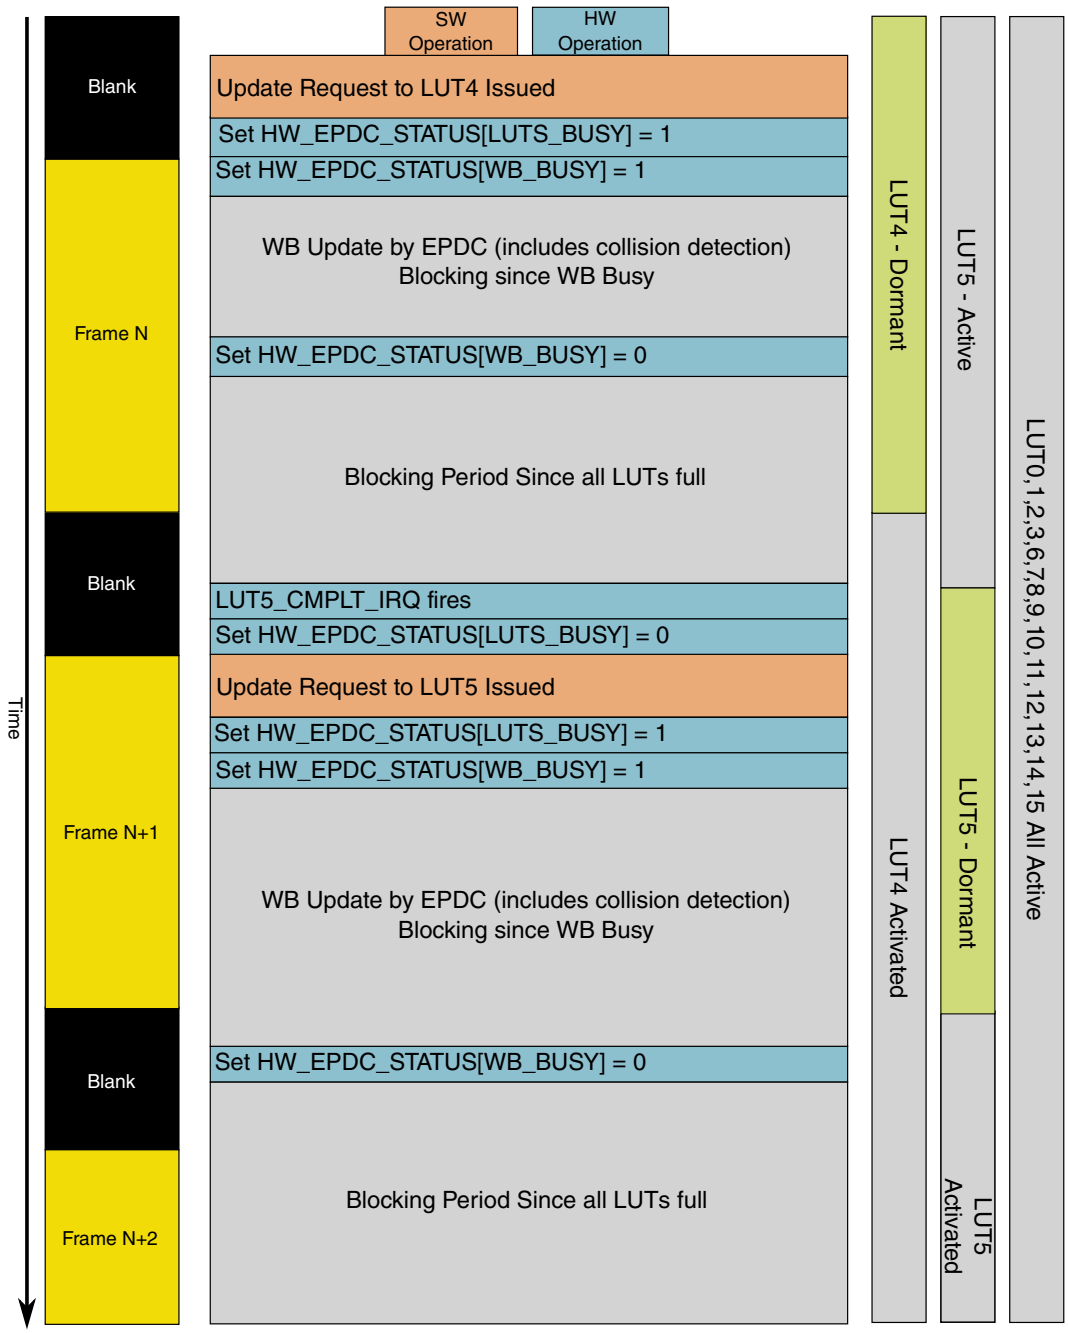

Figure 24-15. Temporal Flow of Update Processing

24.3.10 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of EPDC_CTRL[CLKGATE]. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must compete the final FRAME_END blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final EPDC_IRQ[LUTn_CMPLT_IRQ] is reached, the driver should enable the TCE_IDLE interrupt mask bit via EPDC_IRQ_MASK[TCE_IDLE_IRQ_EN], unmask other interrupts and return.
- Once the final blanking time of the last LUT (FRAME_END time) is completed and the TCE reaches its idle state, the EPDC will assert the EPDC_IRQ[TCE_IDLE_IRQ] interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on EPDC_CTRL[CLKGATE].

Alternative implementations of the driver could simply involve polling for the EPDC_IRQ[TCE_IDLE_IRQ] interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs LUTn_CMPLT_IRQ time and TCE_IDLE_IRQ interrupt is equal to the FRAME_END time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

24.3.11 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the Arm platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

24.3.11.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

Table 24-4. EPDC Bus Requestor Profiles

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in Memory Requirements, it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update

while performing refresh operations, but refresh operations always have the highest priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) = roundup4(EPDC_RES[HORIZONTAL]) x EPDC_RES[VERTICAL] x Frame Rate x (1/Active Time) x 2 x$(1/1024^2)$

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

BW (MB/S) = 2048 x1536 x 106 x (1/0.8) x 2 x $(1/1024^2)$ = 795 MB/s

(Note that 2048 mod 4 = 0.)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

24.3.11.2 Pixel Latency FIFO

The EPDC contains one working buffer latency FIFO which is used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

The FIFO is sized at 1024 pixels each in order to provide significant system memory latency tolerance. The pixel FIFO is dedicated for the main screen and the second is in dual-scan cases for the second half of the screen.

Under no circumstance should the EPDC pixel FIFO reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE_UNDERRUN_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFO are using by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

24.3.11.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by EPDC_FIFOCTRL[FIFO_INIT_LEVEL].

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is (FIFO_INIT_LEVEL+1) x 4.

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than (EPDC_RES[VERTICAL] x EPDC_RE[HORIZONTAL]) /4.

24.3.11.4 Update/Refresh Tuning (VSCAN_HOLDOFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in Figure 24-15, the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The EPDC_TCE_CTRL[VSCAN_HOLDOFF] control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by VSCAN_HOLDOFF is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of VSCAN_HOLDOFF can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

24.3.11.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC_FIFOCTRL registers can be used to drive the epdc_panic output signal during times when the EPDC requests require priority elevation. As long as epdc_panic is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC_FIFOCTRL[ENABLE_PRIORITY] must be set to enable epdc_panic functionality.
- EPDC_FIFOCTRL[FIFO_L_LEVEL] determines FIFO threshold which causes epdc_panic to assert when crossed.
- EPDC_FIFOCTRL[FIFO_H_LEVEL] once epdc_panic has been asserted due to the pixel FIFO(s) crossing FIFO_L_LEVEL, this value, which must be set higher than FIFO_L_LEVEL, determines the point at which epdc_panic will de-assert as the FIFO(s) fills.

Note that the delta between FIFO_H_LEVEL and FIFO_L_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the epdc_panic signal.

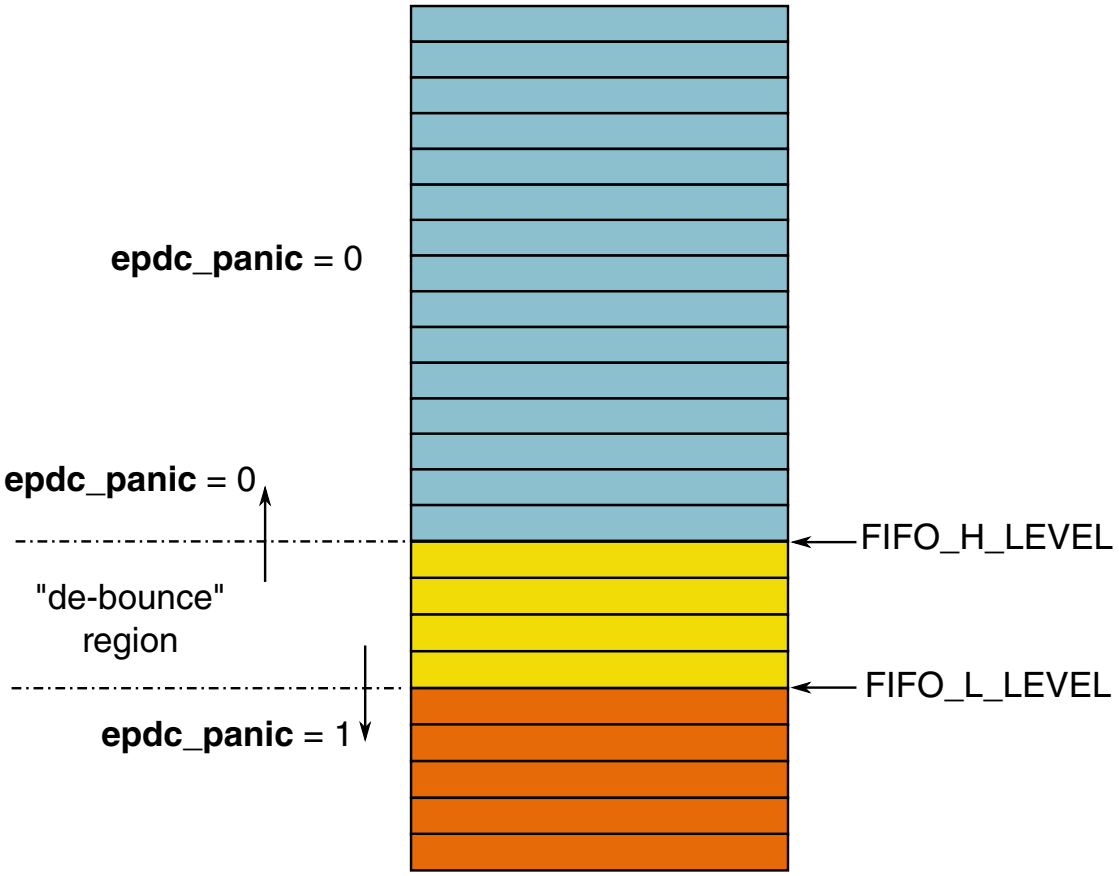

Figure 24-16. FIFO Priority Elevation

24.4 EPDC Memory Map/Register Definition

EPDC Register Format Summary

EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20F_4000	EPDC Control Register (EPDC_CTRL)	32	R/W	C000_0000h	24.4.1/1249

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
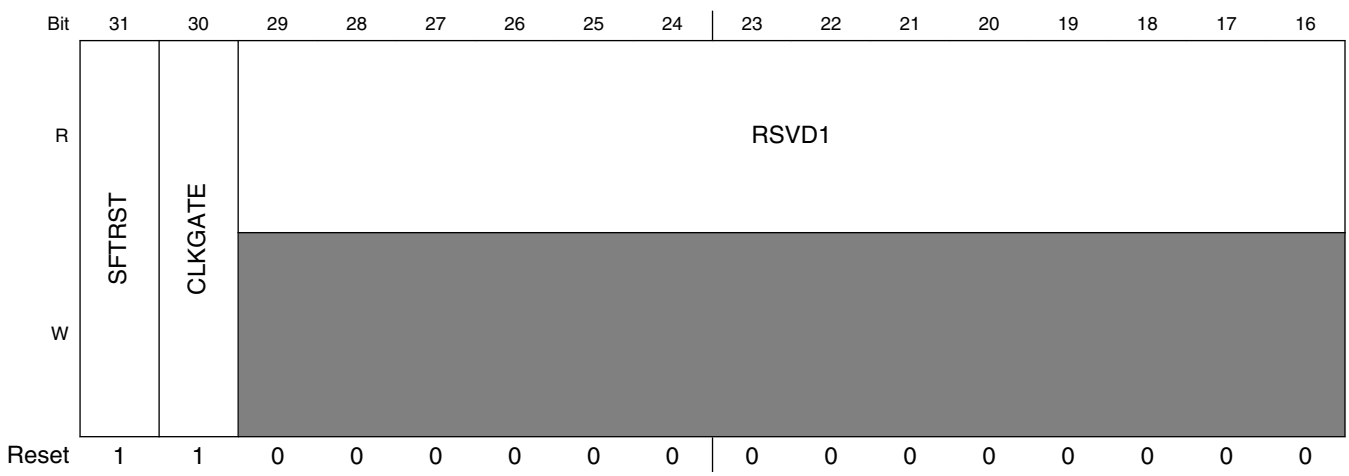
20F_4C10	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_1)	32	R/W	0000_0000h	24.4.102/ 1332
20F_4C20	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_2)	32	R/W	0000_0000h	24.4.103/ 1333

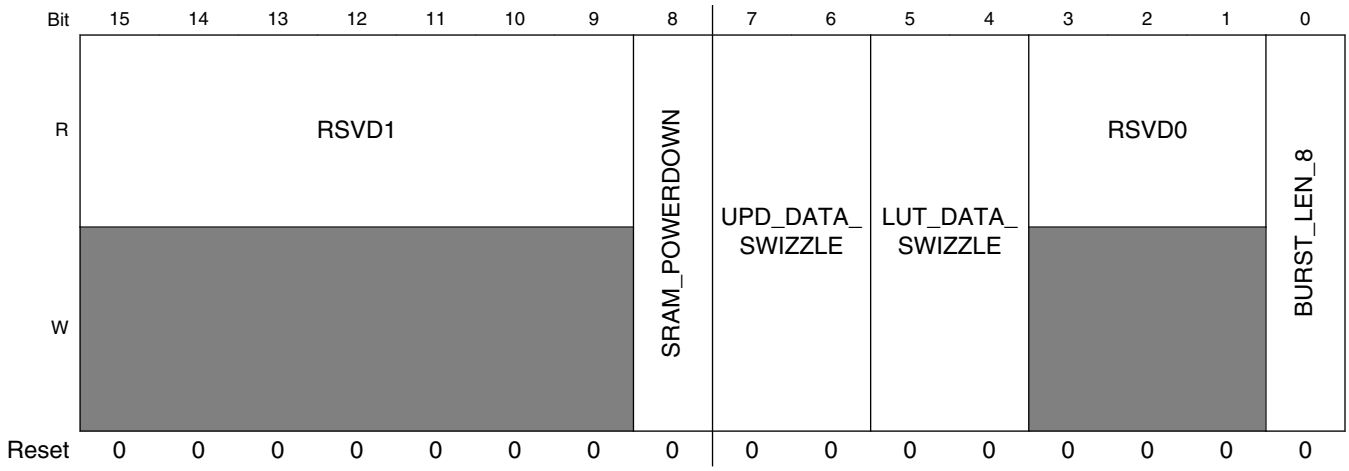
24.4.1 EPDC Control Register (EPDC_CTRL*n*)

EPDC Main control register

This register controls various high-level functions of the EPDC



EXAMPLE



```
/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
    ;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
    ;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 20F_4000h base + 0h offset + (4d × i), where i=0d to 3d

EPDC_CTRL*n* field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–9 RSVD1	Reserved.
8 SRAM_ POWERDOWN	Enable Power-down of embedded SRAM memories
7–6 UPD_DATA_ SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Plesae note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations: 0x0 **NO_SWAP** — No byte swapping.(Little endian) 0x1 **ALL_BYTES_SWAP** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
5–4 LUT_DATA_ SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations: 0x0 **NO_SWAP** — No byte swapping.(Little endian) 0x1 **ALL_BYTES_SWAP** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
3–1 RSVD0	Reserved.
0 BURST_LEN_8	0- EPDC display fifo logic will issue AXI bursts of length 16. When set to 1, the block will issue bursts of length 8.

24.4.2 EPDC Waveform Address Pointer (EPDC_WVADDR)

EPDC Waveform Address Pointer

EXAMPLE

```
/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
    ;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
    ;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 20F_4000h base + 20h offset = 20F_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_WVADDR field descriptions

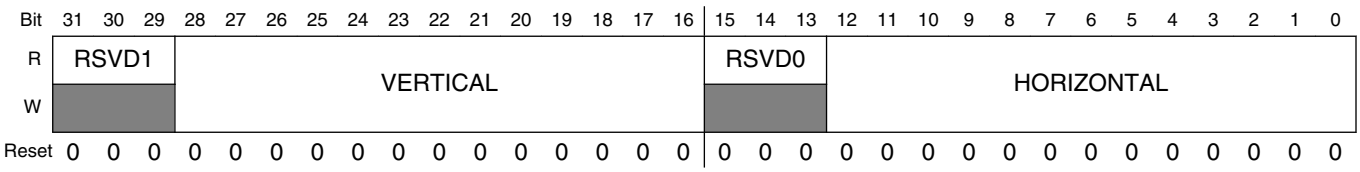
Field	Description
ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

24.4.3 EPDC Working Buffer Address (EPDC_WB_ADDR)

EPDC Working Buffer Address

Address: 20F_4000h base + 30h offset = 20F_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



EPDC_WB_ADDR field descriptions

Field	Description
ADDR	Address for EPDC working buffer. This address must be a aligned to a 64-bit double-word boundary.

24.4.4 EPDC Screen Resolution (EPDC_RES)

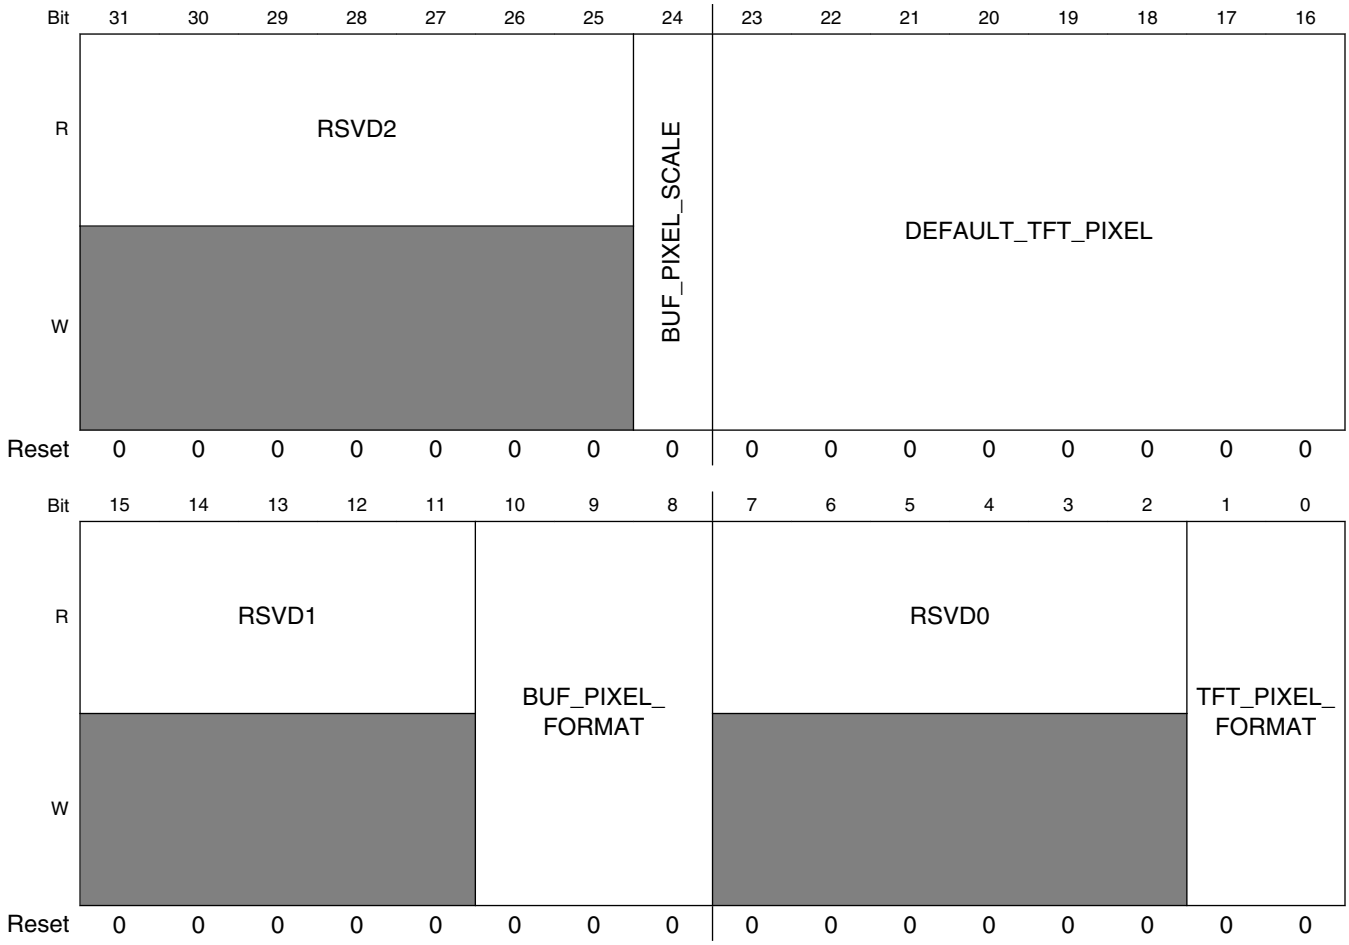
EPDC Screen Resolution. This register defines the horizontal and vertical resolution of the target display panel

Address: 20F_4000h base + 40h offset = 20F_4040h

EPDC_RES field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 VERTICAL	Vertical Resoltion (in pixels)
15–13 RSVD0	Reserved.
HORIZONTAL	Horizontal Resolution (in pixels)

24.4.5 EPDC Format Control Register (EPDC_FORMAT*n*)



EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

EXAMPLE

```
/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
    | EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
    | ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
       EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
```

Address: 20F_4000h base + 50h offset + (4d × i), where i=0d to 3d

EPDC_FORMAT*n* field descriptions

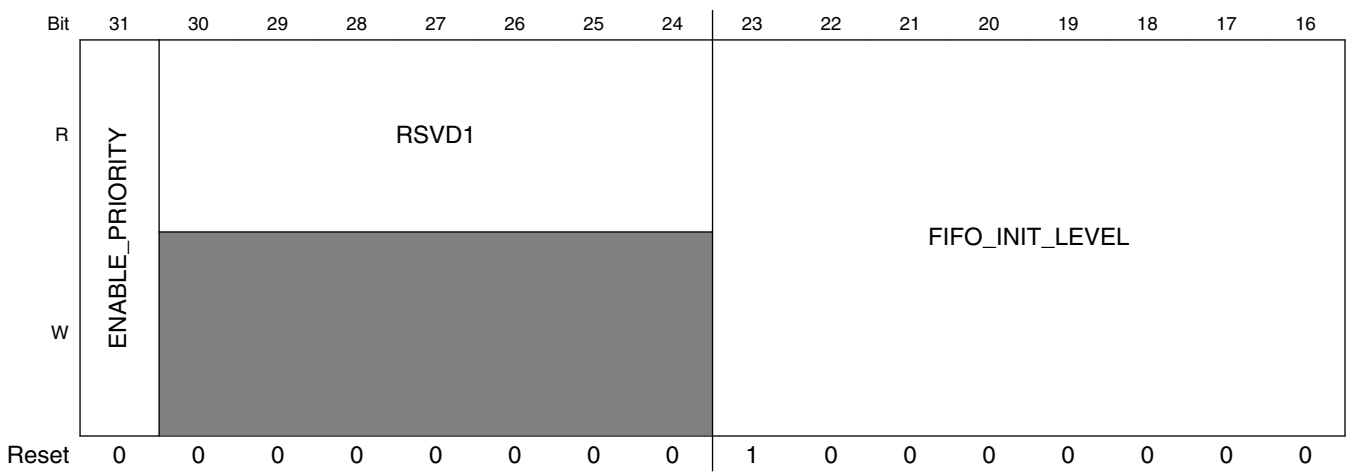
Field	Description
31–25 RSVD2	Reserved.
24 BUF_PIXEL_ SCALE	Selects method of conversion from 8-bit input 0x0 **TRUNCATE** — Use Truncate method (LSB) 0x1 **ROUND** — Use rounding method (with saturation)
23–16 DEFAULT_TFT_ PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15–11 RSVD1	Reserved.
10–8 BUF_PIXEL_ FORMAT	EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms) 0x2 **P2N** — 2-bit pixel 0x3 **P3N** — 3-bit pixel 0x4 **P4N** — 4-bit pixel 0x5 **P5N** — 5-bit pixel

Table continues on the next page...

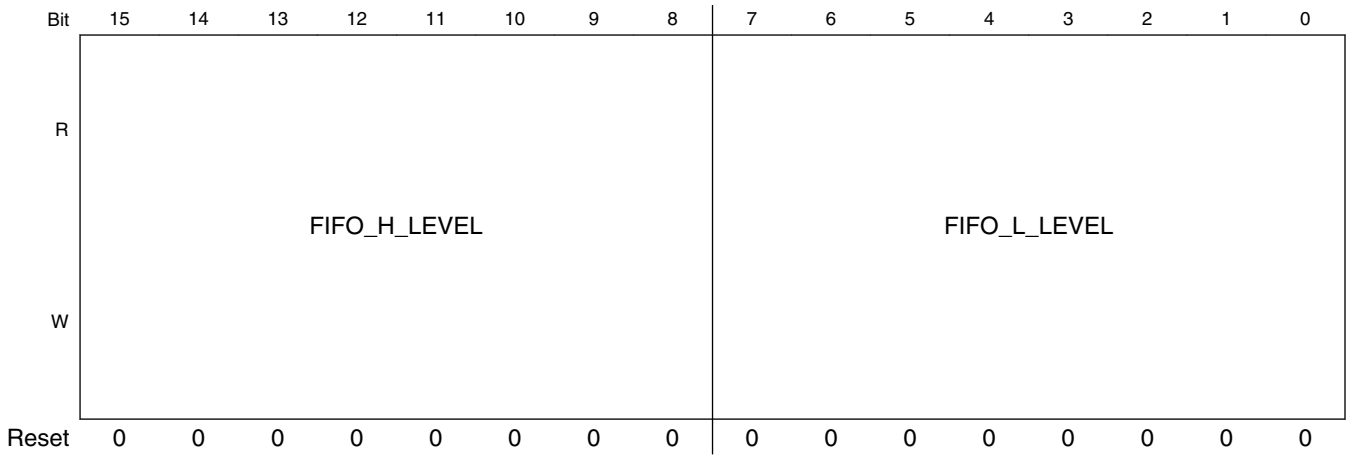
EPDC_FORMAT*n* field descriptions (continued)

Field	Description
7–2 RSVD0	Reserved.
TFT_PIXEL_ FORMAT	EPDC TFT Pixel Format. This defines how many bits of the DATA bus are required per pixel. This field must be consistent with the waveform and panel architecture. 0x0 **2B** — 2-bit 0x1 **2BV** — 2-bit and VCOM 0x2 **4B** — 4-bit 0x3 **4BV** — 4-bit and VCOM

24.4.6 EPDC FIFO control register (EPDC_FIFOCTRL*n*)



Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware



This register houses FIFO control bits

EXAMPLE

```
/* EPDC_FIFOCTRL (disabled) */
reg_val =
    ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
    | ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
    | ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);
```

Address: 20F_4000h base + A0h offset + (4d × i), where i=0d to 3d

EPDC_FIFOCTRL*n* field descriptions

Field	Description
31 ENABLE_ PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 RSVD1	Reserved.
23–16 FIFO_INIT_ LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated
FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

24.4.7 EPDC Update Region Address (EPDC_UPD_ADDR)

EPDC Update Region Address

The address alignment depends on whether the update region stride register (EPDC_UPD_STRIDE) is set or not.

If EPDC_UPD_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC_UPD_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recomended be get best bus performance.

EXAMPLE1

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100;    /* 8-byte aligned */
```

```
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

EXAMPLE2

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123;    /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 20F_4000h base + 100h offset = 20F_4100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_UPD_ADDR field descriptions

Field	Description
ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

24.4.8 EPDC Update Region Stride (EPDC_UPD_STRIDE)

EPDC Update Region Stride

When UPD_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD_WIDTH should be set to real line bytes count as normal, while UPD_STRIDE set to byte distance between two lines' start.

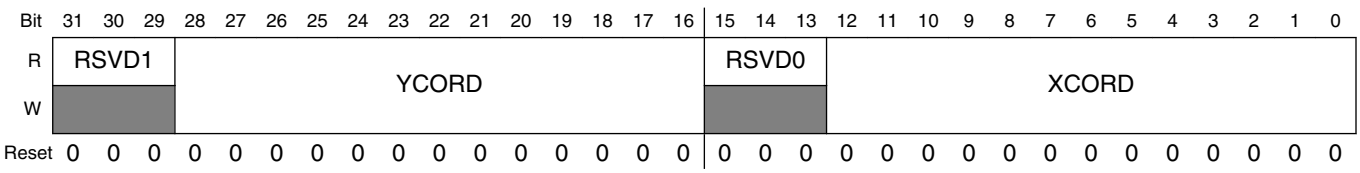
EXAMPLE

```
see details on stride feature introduction
```

Address: 20F_4000h base + 110h offset = 20F_4110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	STRIDE																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_UPD_STRIDE field descriptions



Field	Description
STRIDE	line stride for incoming region update

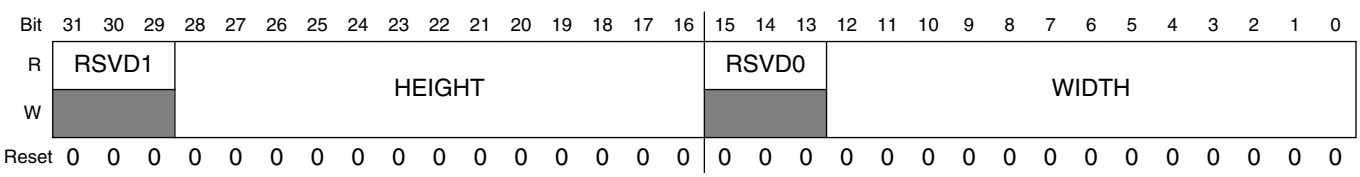
24.4.9 EPDC Update Command Co-ordinate (EPDC_UPD_CORD)

EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 20F_4000h base + 120h offset = 20F_4120h

EPDC_UPD_CORD field descriptions



Field	Description
31–29 RSVD1	Reserved.
28–16 YCORD	Y co-ordinate for incoming region update
15–13 RSVD0	Reserved.
XCORD	X co-ordinate for incoming region update

24.4.10 EPDC Update Command Size (EPDC_UPD_SIZE)

EPDC Update Command Size

This register sets up the size of an update region.

Address: 20F_4000h base + 140h offset = 20F_4140h

EPDC_UPD_SIZE field descriptions

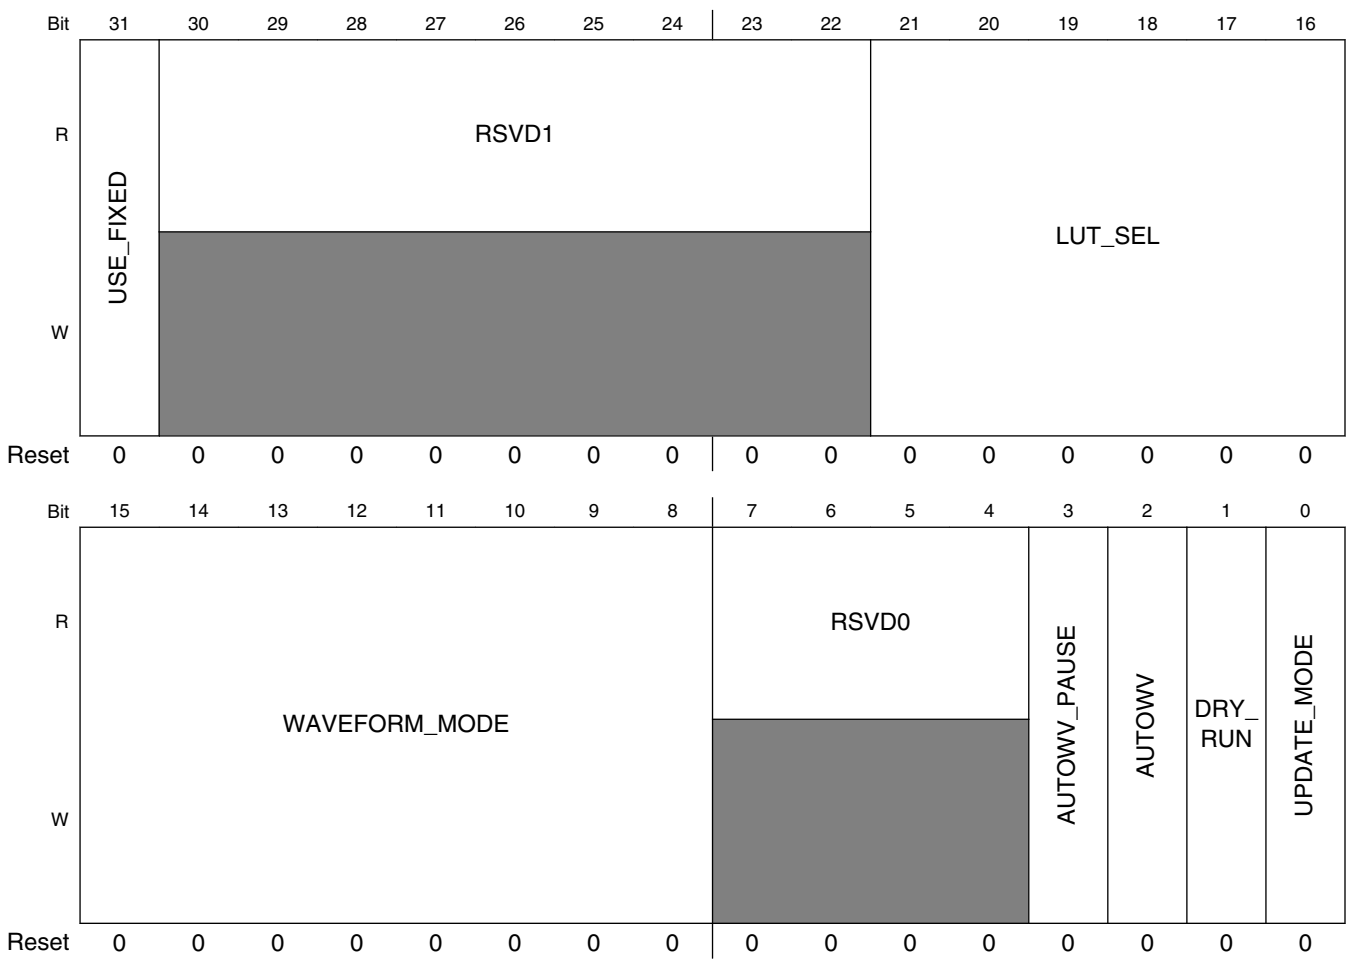
Field	Description
31–29 RSVD1	Reserved.
28–16 HEIGHT	Height (in pixels)

Table continues on the next page...

EPDC_UPD_SIZE field descriptions (continued)

Field	Description
15–13 RSVD0	Reserved.
WIDTH	Width (in pixels)

24.4.11 EPDC Update Command Control (EPDC_UPD_CTRL*n*)



EPDC Update Command Control. Writing to this registers triggers and update request operation.

Update control register

EXAMPLE

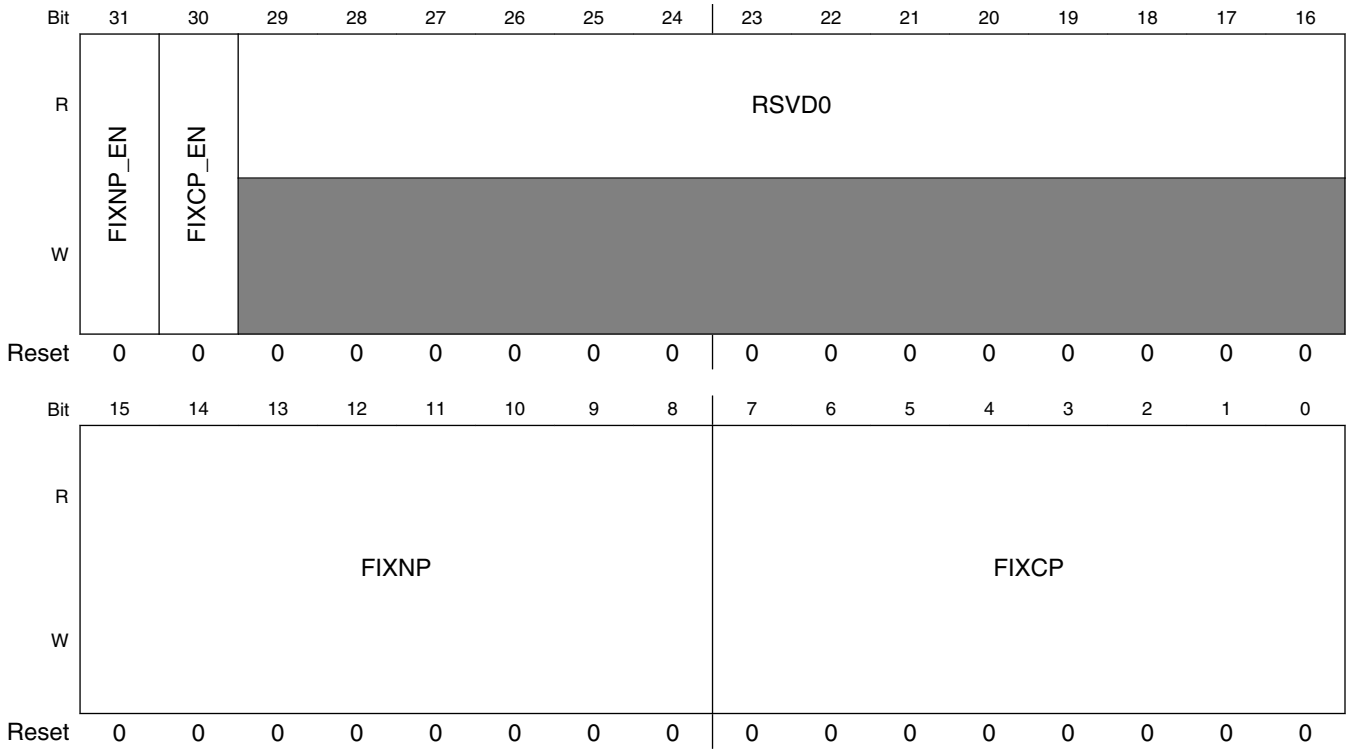
```
HW_DIGCTL_CTRL_CLR(BM_DIGCTL_CTRL_USB_CLKGATE);  // enable USB clock
```

Address: 20F_4000h base + 160h offset + (4d × i), where i=0d to 3d

EPDC_UPD_CTRL*n* field descriptions

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of HW_EPDC_UPD_FIXED)
30–22 RSVD1	Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_ MODE	Waveform Mode 0-255
7–4 RSVD0	Reserved.
3 AUTOWV_ PAUSE	0x0 **AUTO** — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 **MANUAL** — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 **PARTIAL** — Partial Update : only process changed pixels in region 0x1 **FULL** — Full Update : process all pixels in region

24.4.12 EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED*n*)



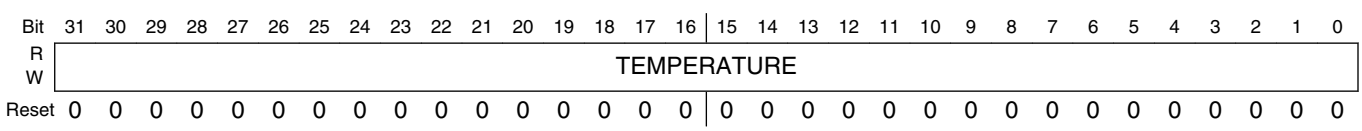
EPDC Update Control register for fixed-pixel updates (enabled via HW_EPDC_UPD_CTRL[USE_FIXED])

Update control register for fixed-pixel update values

EXAMPLE

```
TBD.
```

Address: 20F_4000h base + 180h offset + (4d × i), where i=0d to 3d



EPDC_UPD_FIXED*n* field descriptions

Field	Description
31 FIXNP_EN	If set to 1, current updated region has the NP value defined by FIXNP
30 FIXCP_EN	If set to 1, current updated region has the CP value defined by FIXCP
29–16 RSVD0	Reserved.
15–8 FIXNP	NP value if fixenp_en is set to 1. Data in Y8 format.
FIXCP	CP value if fixecp_en is set to 1. Data in Y8 format.

24.4.13 EPDC Temperature Register (EPDC_TEMP)

EPDC Temperature Compensation Register

Address: 20F_4000h base + 1A0h offset = 20F_41A0h

EPDC_TEMP field descriptions

Field	Description
TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

24.4.14 Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT)

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV_LUT mem indexed with 'ADDR'

Address: 20F_4000h base + 1C0h offset = 20F_41C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

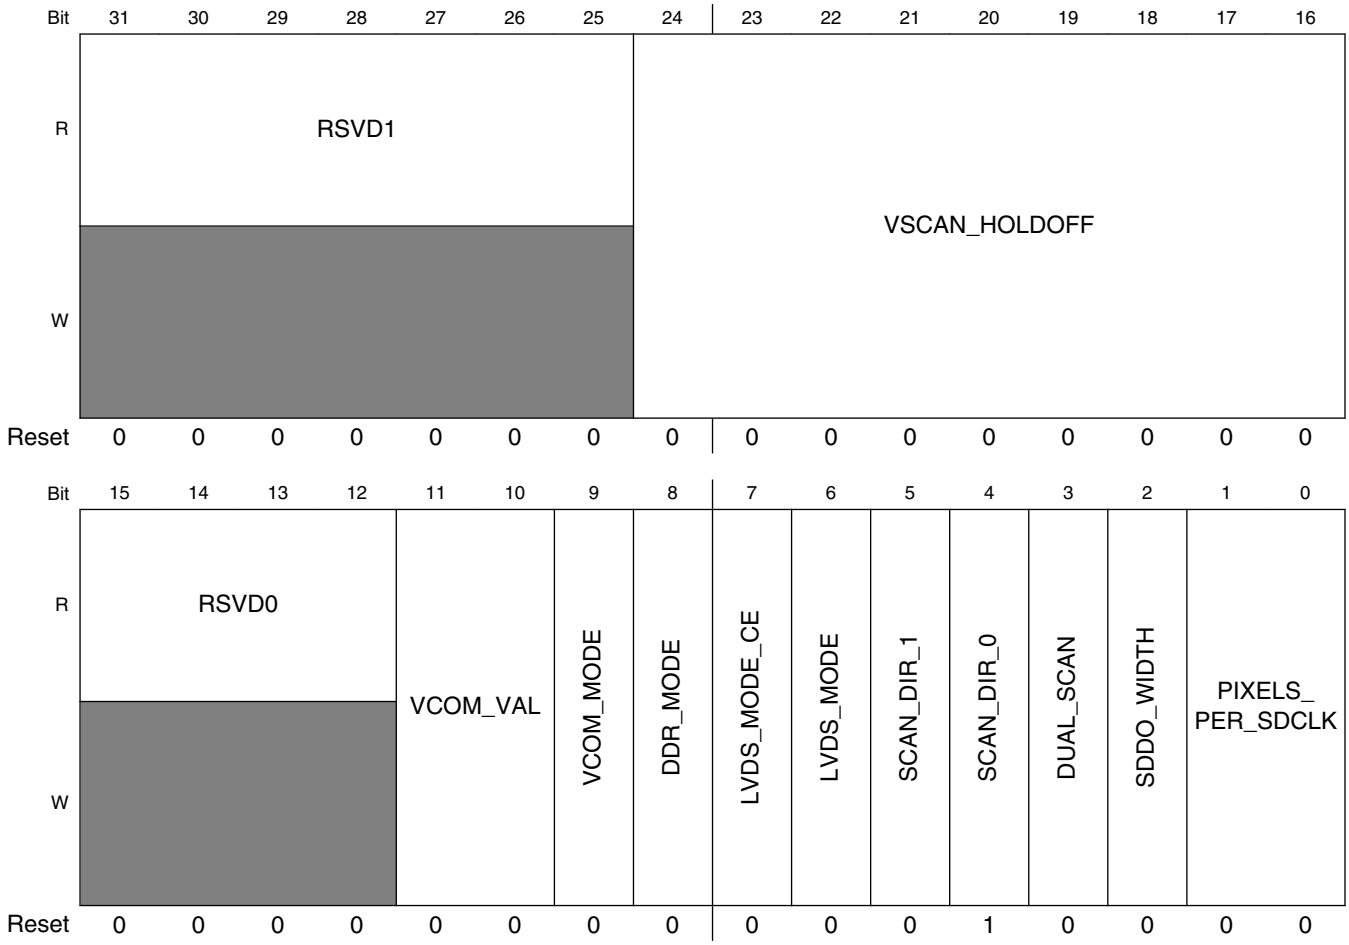
EPDC_AUTOWV_LUT field descriptions



Field	Description
31–24 RSVD1	Reserved, always set to zero.
23–16 DATA	DATA
15–8 RSVD0	Reserved, always set to zero.
ADDR	ADDR

24.4.15 EPDC Timing Control Engine Control Register (EPDC_TCE_CTRL*n*)

TCE general control register

This register houses Horizontal scan timing. Note that line data length is derived from HW_EPDC_RES.

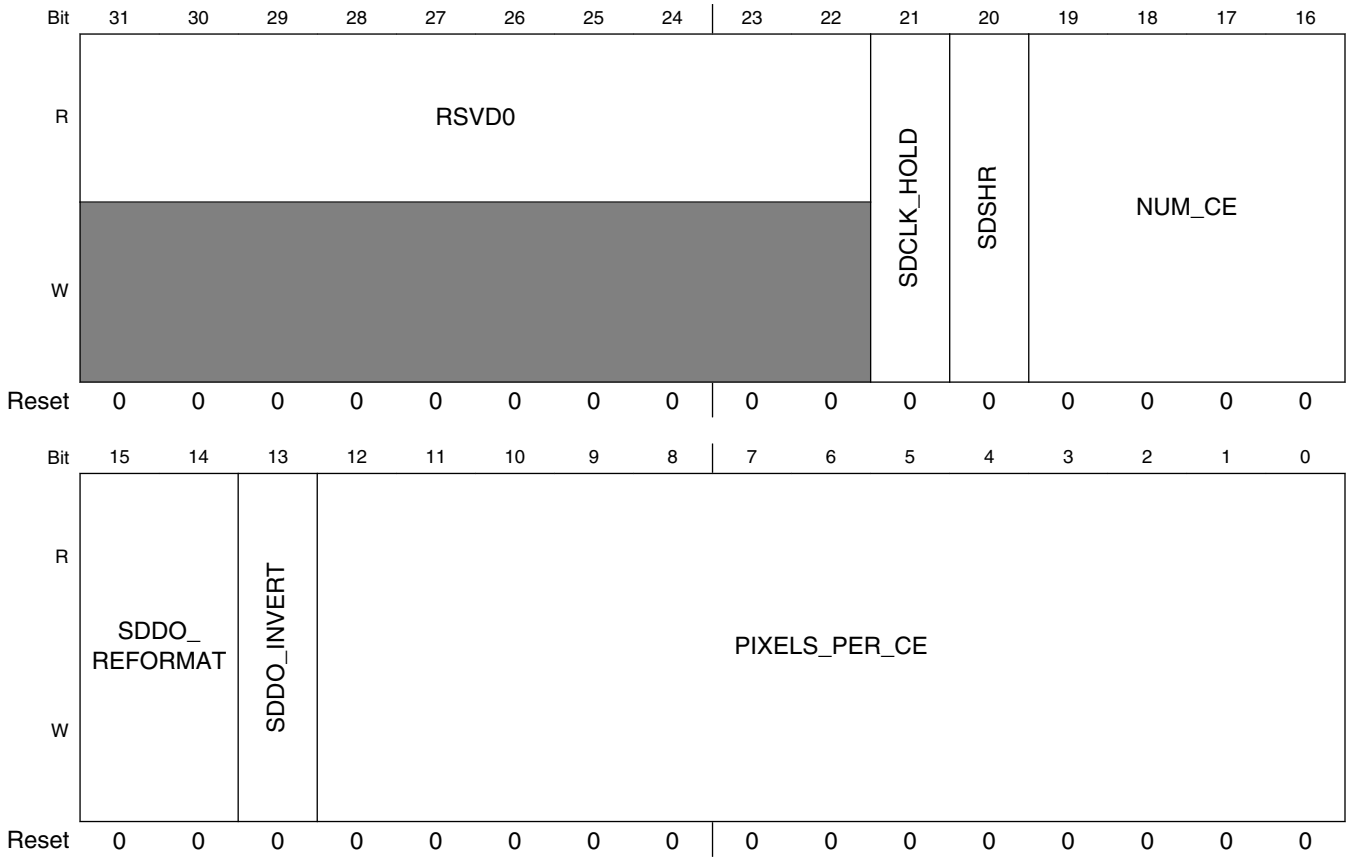
Address: 20F_4000h base + 200h offset + (4d × i), where i=0d to 3d

EPDC_TCE_CTRL*n* field descriptions

Field	Description
31–25 RSVD1	Reserved.
24–16 VSCAN_ HOLDOFF	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 RSVD0	Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 **MANUAL** — VCOM Value is set manually using VCOM_VAL field 0x1 **AUTO** — VCOM Value is used from waveform
8 DDR_MODE	If set, DATA data is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.

Table continues on the next page...

EPDC_TCE_CTRL*n* field descriptions (continued)



Field	Description
7 LVDS_MODE_CE	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the DATA bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit DATA interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel 0x1 **UP** — Scan this region from bottom to top 0x0 **DOWN** — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel 0x1 **UP** — Scan this region from bottom to top 0x0 **DOWN** — Scan this region from top to bottom
3 DUAL_SCAN	Enables dual scan-mode. Note in this mode, SDDO_BUS_FORMAT=16BIT must be selected. and PIXELS_PER_CLK applies to each 8-bit segment of the DATA bus.
2 SDDO_WIDTH	Selects either 8 or 16 bit DATA bus format 0x0 **8BIT** — Connect to 8-bit source driver 0x1 **16BIT** — Connct to 16-bit source driver
PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXLK to generate the SDCLK such that SDCLK = PIXCLK/PIXELS_PER_SDCLK. For dual-scan mode (DUAL_SCAN=1), this applies to 8-bit half of the 16-bit DATA. It should be noted that when DDR_MODE is enabled, both edges of the clock have to be accounted for in this value, so for example with an 8-bit DATA, 2-bit TFT pixel, this field should be set to EIGHT (four pixels on the pos-edge and 4-pixels on the neg-edge) 0x0 **RESERVED** — Reserved 0x1 **TWO** — Two TFT-pixels per SDCLK 0x2 **FOUR** — Four TFT-pixels per SDCLK 0x3 **EIGHT** — Eight TFT-pixels per SDCLK

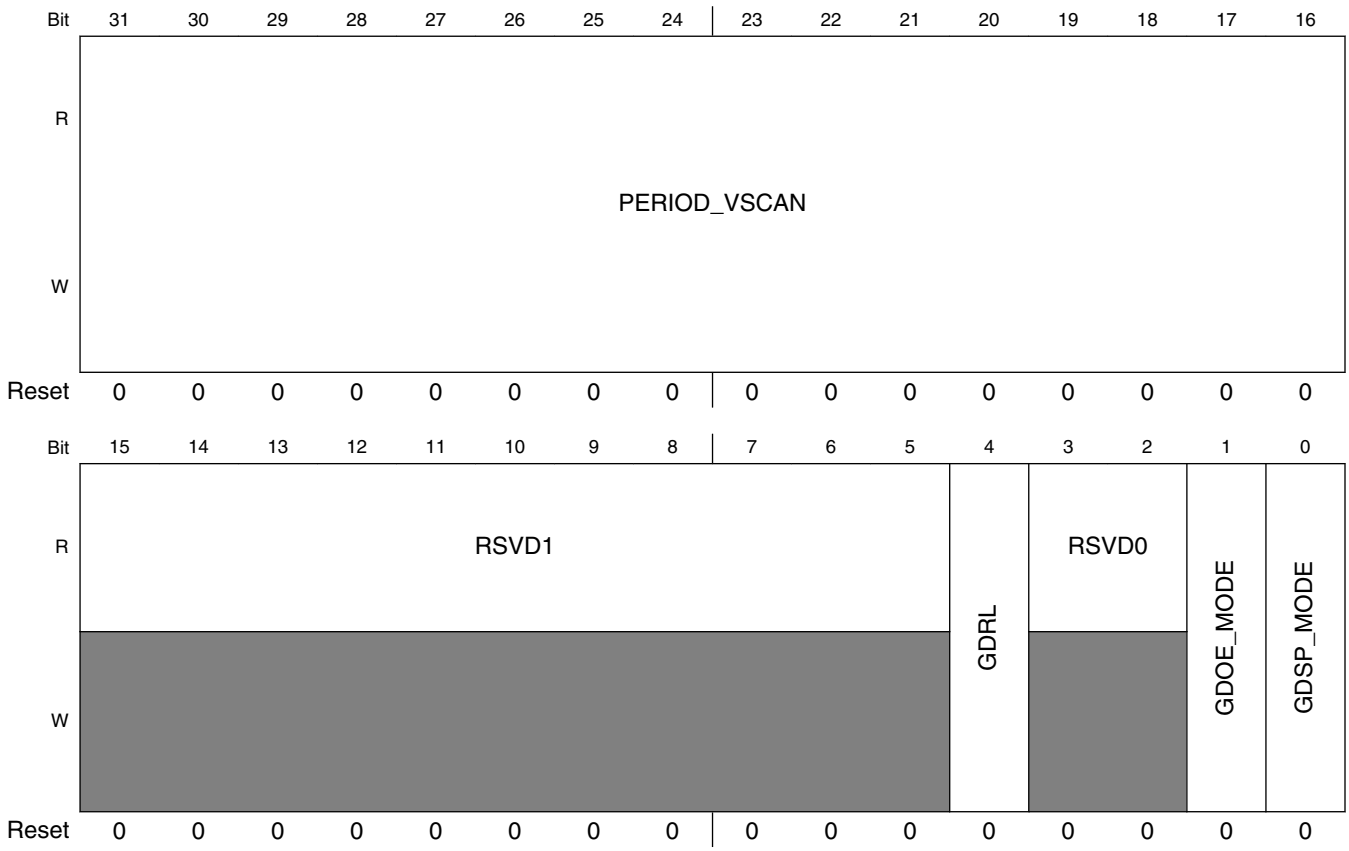
24.4.16 EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFG*n*)

Source-driver configuration register

This register houses source-driver configuration.

Address: 20F_4000h base + 220h offset + (4d × i), where i=0d to 3d

EPDC_TCE_SDCFG*n* field descriptions



Field	Description
31–22 RSVD0	Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_ REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface: 0x0 **STANDARD** — No change. 0x1 **FLIP_PIXELS** — Reverses the order of the pixels on DATA. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each DATA bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
PIXELS_PER_ CE	Number of pixels (outputs) per source-driver IC. Please note that HW_EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

24.4.17 EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFG*n*)

Source-driver configuration register

This register houses gate-driver configuration.

Address: 20F_4000h base + 240h offset + (4d × i), where i=0d to 3d

EPDC_TCE_GDCFG*n* field descriptions

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splited, this reg defines the counter period
15–5 RSVD1	Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 RSVD0	Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by HW_EPDC_TCE_TIMING3[GDOE_OFFSET].

Table continues on the next page...

EPDC_TCE_GDCFG*n* field descriptions (continued)

Field	Description
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

24.4.18 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1*n*)

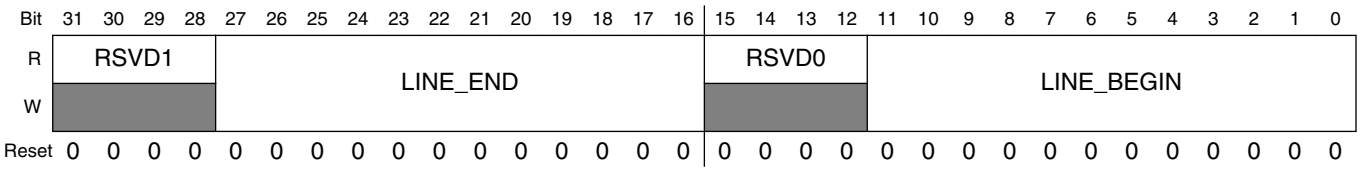
Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS_PER_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from HW_EPDC_RES.

Address: 20F_4000h base + 260h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1				LINE_SYNC_WIDTH												RSVD0				LINE_SYNC											
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_TCE_HSCAN1*n* field descriptions



Field	Description
31–28 RSVD1	Reserved.
27–16 LINE_SYNC_ WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 RSVD0	Reserved.
LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

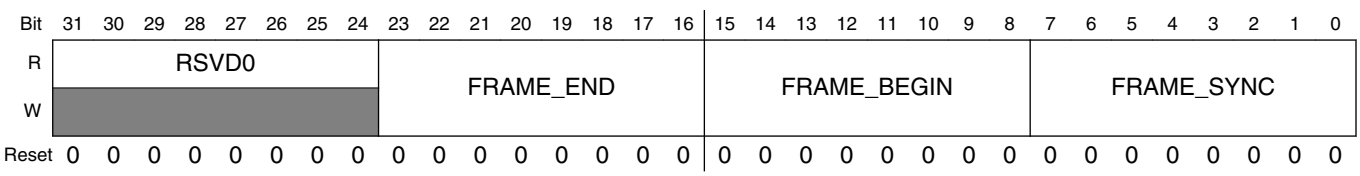
24.4.19 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2*n*)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS_PER_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from HW_EPDC_RES.

Address: 20F_4000h base + 280h offset + (4d × i), where i=0d to 3d

EPDC_TCE_HSCAN2*n* field descriptions



Field	Description
31–28 RSVD1	Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 RSVD0	Reserved.
LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

24.4.20 EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCAN*n*)

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from HW_EPDC_RES.

Address: 20F_4000h base + 2A0h offset + (4d × i), where i=0d to 3d

EPDC_TCE_VSCAN*n* field descriptions

Field	Description
31–24 RSVD0	Reserved.
23–16 FRAME_END	Number of lines for frame end duration.
15–8 FRAME_BEGIN	Number of lines for frame begin duration.
FRAME_SYNC	Number of lines for frame sync duration.

24.4.21 EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OE*n*)

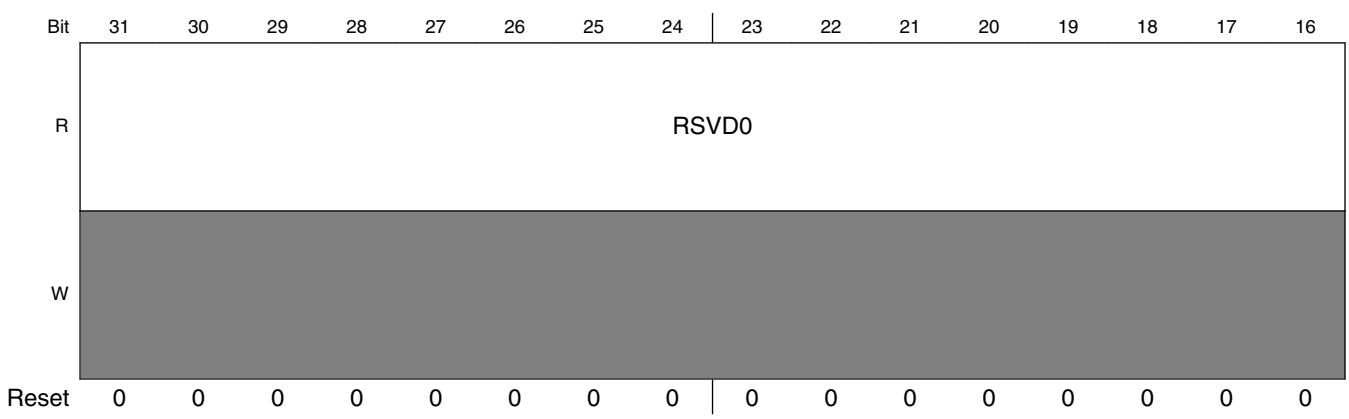
This register contain delay programming values for the SDOEZ and SDOED source driver control signals

This register contain delay programming values for the SDOZ and SDOE source driver control signals

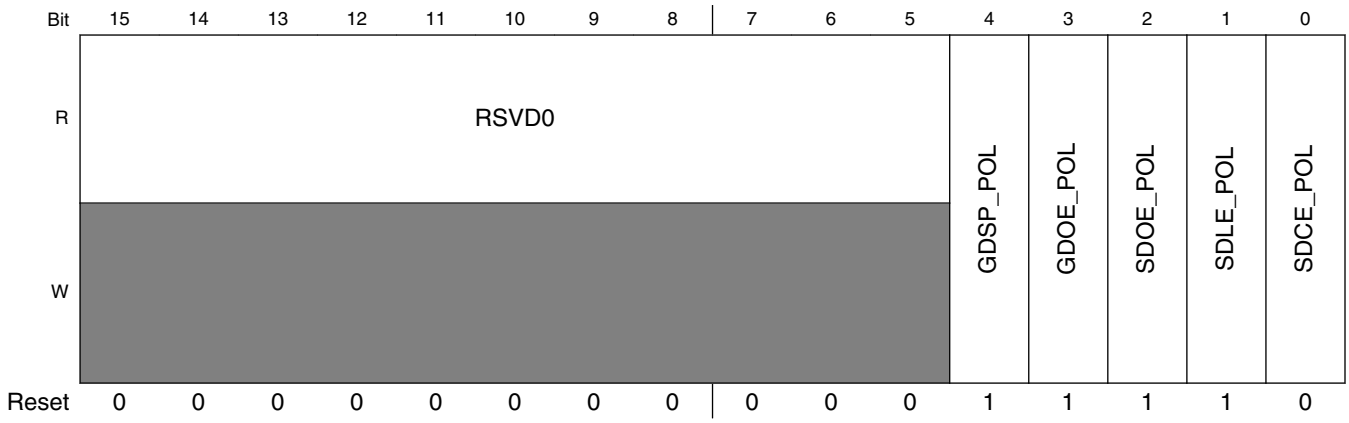
Address: 20F_4000h base + 2C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SDOED_WIDTH								SDOED_DLY								SDOEZ_WIDTH								SDOEZ_DLY							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_TCE_OE*n* field descriptions



Field	Description
31–24 SDOED_WIDTH	Number of PIXCLK cycles from SDOED high to SDOED falling (Must be greater than 0)
23–16 SDOED_DLY	Number of PIXCLK cycles from SDOEZ low to SDOED rising (Must be greater than 0)
15–8 SDOEZ_WIDTH	Number of PIXCLK cycles from SDOEZ high to SDOEZ falling (Must be greater than 0)
SDOEZ_DLY	Number of PIXCLK cycles from SDLE falling edge to SDOEZ rising (Must be greater than 0)



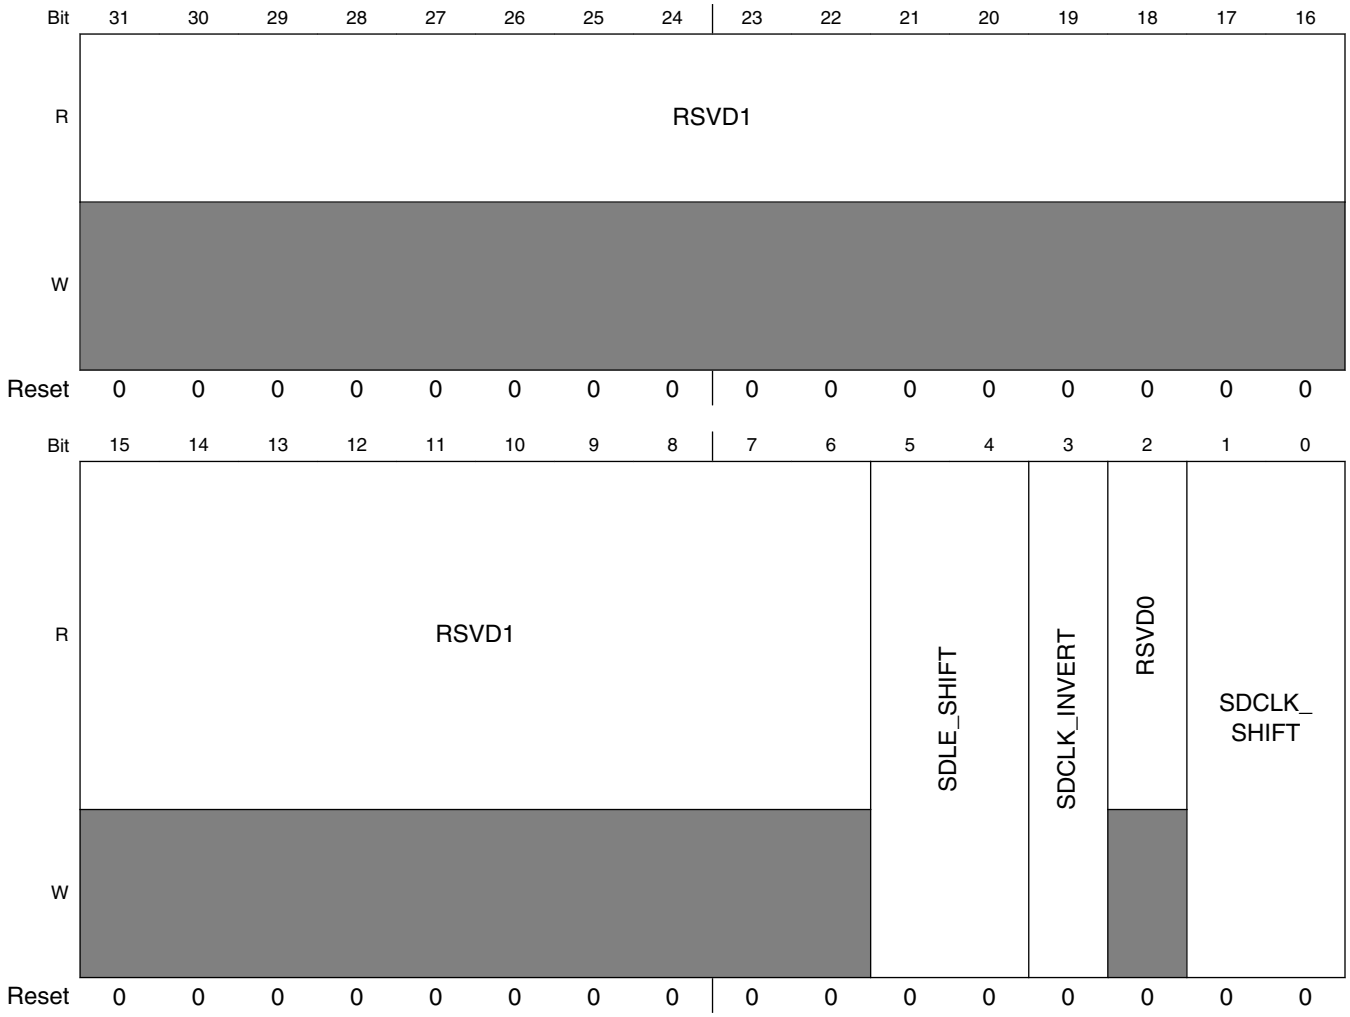
24.4.22 EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITY)

This registers allows for programming the polarity of source/gate driver control signals

This register houses FIFO control bits

Address: 20F_4000h base + 2E0h offset = 20F_42E0h

EPDC_TCE_POLARITY field descriptions



Field	Description
31–5 RSVD0	Reserved.
4 GDSP_POL	0 = Active Low, 1 = Active High. Applies to the GDSP output
3 GDOE_POL	0 = Active Low, 1 = Active High. Applies to the GDOE output
2 SDOE_POL	0 = Active Low, 1 = Active High. Applies to the SDOE. Does not apply to SDOEZ and SDOED outputs
1 SDLE_POL	0 = Active Low, 1 = Active High. Applies to the SDLE output
0 SDCE_POL	0 = Active Low, 1 = Active High. Applies to all 10 SDCE outputs

24.4.23 EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1*n*)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 300h offset + (4d × i), where i=0d to 3d

EPDC_TCE_TIMING1*n* field descriptions

Field	Description
31–6 RSVD1	Reserved.
5–4 SDLE_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 3 PIXCLK cycles 0x0 **NONE** — No shift of SDLE 0x1 **ONE** — Shift SDLE 1 pixclk cycle 0x2 **TWO** — Shift SDLE 2 pixclk cycles 0x3 **THREE** — Shift SDLE 3 pixclk cycles
3 SDCLK_INVERT	Invert phase of SDCLK
2 RSVD0	Reserved.
SDCLK_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 4 cycles

Table continues on the next page...

EPDC_TCE_TIMING1*n* field descriptions (continued)

Field	Description
	0x0 **NONE** — No shift of SDCLK 0x1 **ONE** — Shift SDCLK 1 pixclk cycle 0x2 **TWO** — Shift SDCLK 2 pixclk cycles 0x3 **THREE** — Shift SDCLK 3 pixclk cycles

24.4.24 EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2*n*)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 310h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GDCLK_HP																GDSP_OFFSET															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

EPDC_TCE_TIMING2*n* field descriptions

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover tha majority of the line timing
GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

24.4.25 EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3*n*)

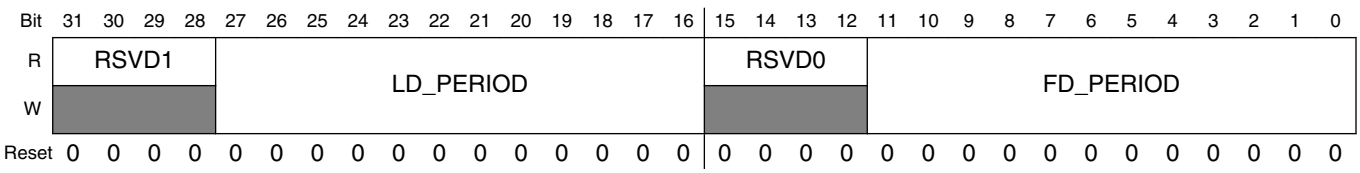
This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 320h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GDOE_OFFSET																GDCLK_OFFSET															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

EPDC_TCE_TIMING3*n* field descriptions



Field	Description
31–16 GDOE_OFFSET	When using GDOE_MODE=1, this register sets the delay from GDCLK to the GDOE in terms of N PIXCLK cycles
GDCLK_ OFFSET	This register allows the user to shift the GDCLK from the line time by N PIXCLK cycles.

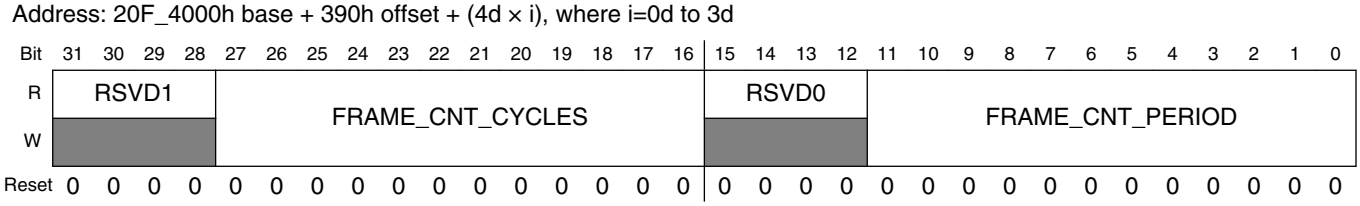
24.4.26 EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0*n*)

This register contains global counter settings for Pigeon Mode

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 380h offset + (4d × i), where i=0d to 3d

EPDC_PIGEON_CTRL0*n* field descriptions



Field	Description
31–28 RSVD1	Reserved.
27–16 LD_PERIOD	period of pclk counter during LD phase
15–12 RSVD0	Reserved.
FD_PERIOD	period of line counter during FD phase

24.4.27 EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1*n*)

This register contains global counter setting for pigeon mode

This register houses general purpose timing adjustment registers

Address: 20F_4000h base + 390h offset + (4d × i), where i=0d to 3d

EPDC_PIGEON_CTRL1*n* field descriptions

Field	Description
31–28 RSVD1	Reserved.
27–16 FRAME_CNT_ CYCLES	max cycles of frame counter
15–12 RSVD0	Reserved.
FRAME_CNT_ PERIOD	period of frame counter

24.4.28 EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1*n*)

Controls masking EPDC LUT complete interrupts

This register controls LUT0~31 IRQ masks for EPDC interrupts

Address: 20F_4000h base + 3C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
LUTN_CMPLT_IRQ	LUT 32~64 Complete Interrupt

24.4.32 EPDC IRQ Mask Register (EPDC_IRQ_MASK*n*)

Controls masking for all EPDC interrupts

This register controls IRQ masks for all EPDC interrupts

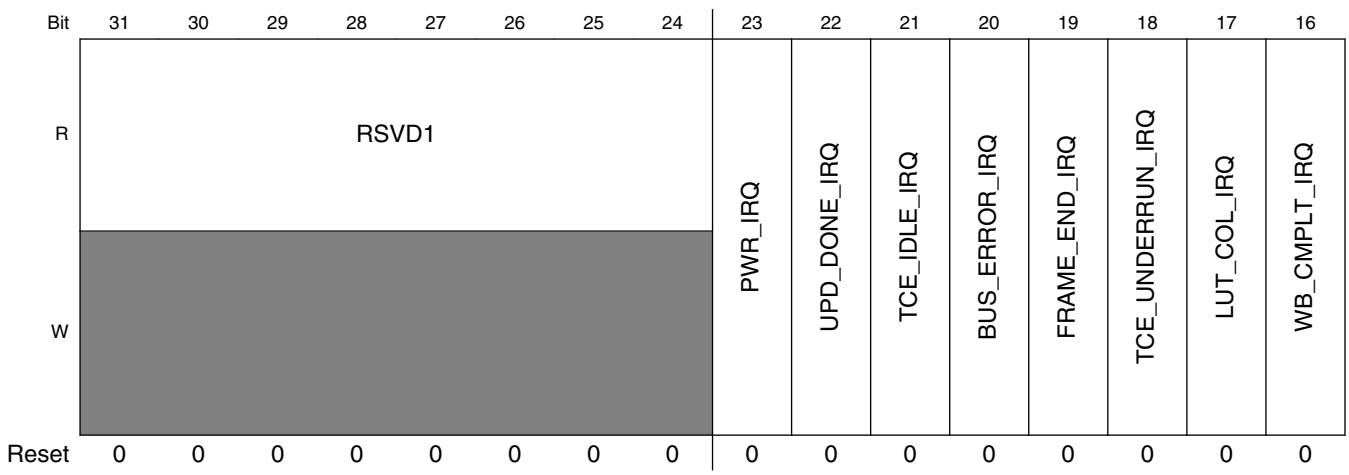
Address: 20F_4000h base + 400h offset + (4d × i), where i=0d to 3d

EPDC_IRQ_MASK*n* field descriptions

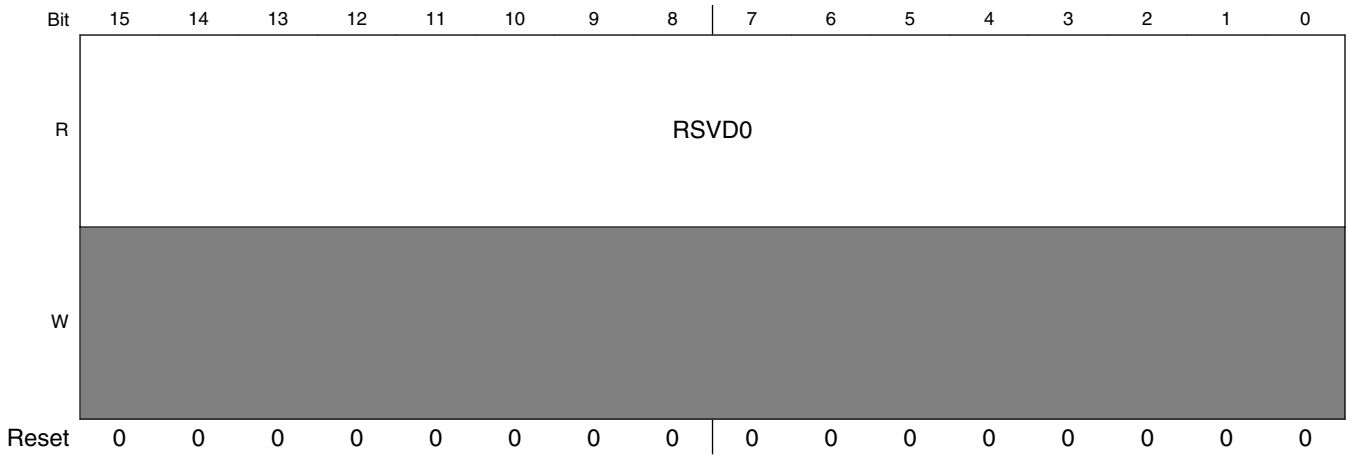
Field	Description
31–24 RSVD1	Reserved.
23 PWR_IRQ_EN	Enable power interrupt
22 UPD_DONE_ IRQ_EN	Enable UPD complete interrupt

Table continues on the next page...

EPDC_IRQ_MASK*n* field descriptions (continued)



Field	Description
21 TCE_IDLE_IRQ_EN	Enable TCE Idle interrupt detection.
20 BUS_ERROR_IRQ_EN	Enable AXI BUS ERROR interrupt detection.
19 FRAME_END_IRQ_EN	If this bit is set, EPDC will assert the current frame end interrupt. This irq is only available during updating period.
18 TCE_UNDERRUN_IRQ_EN	Enable pixel FIFO under-run condition detection.
17 COL_IRQ_EN	Enable collision detection interrupts for all LUTs
16 WB_CMPLT_IRQ_EN	Enable WB complete interrupt
RSVD0	Reserved.



24.4.33 EPDC Interrupt Register (EPDC_IRQ*n*)

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corrrsponding physical update is competed on the screen. Each interrupt has a corresponding mask register in HW_EPDC_IRQ_MASK

This register houses the interrupt bits for the LUT Completions

Address: 20F_4000h base + 420h offset + (4d × i), where i=0d to 3d

EPDC_IRQ*n* field descriptions

Field	Description
31–24 RSVD1	Reserved.
23 PWR_IRQ	Power Interrupt
22 UPD_DONE_IRQ	Working buffer process complete Interrupt
21 TCE_IDLE_IRQ	Interrupt to indicate that the TCE has completed TFT frame scans and is in an idle state.
20 BUS_ERROR_IRQ	Interrupt to indicate AXI BUS error occurs.
19 FRAME_END_IRQ	Interrupt to indicate EPDC has completed the current frame and is in the vertical blanking period.
18 TCE_UNDERRUN_IRQ	Interrupt to indicate that a pixel FIFO under-run has occured.
17 LUT_COL_IRQ	Collision detection interrupt. Check HW_EPDC_STATUS_COL.
16 WB_CMPLT_IRQ	Working buffer process complete Interrupt
RSVD0	Reserved.

24.4.34 EPDC Status Register - LUTs (EPDC_STATUS_LUTS1*n*)

EPDC Status Register - LUTS 0~31

Address: 20F_4000h base + 440h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

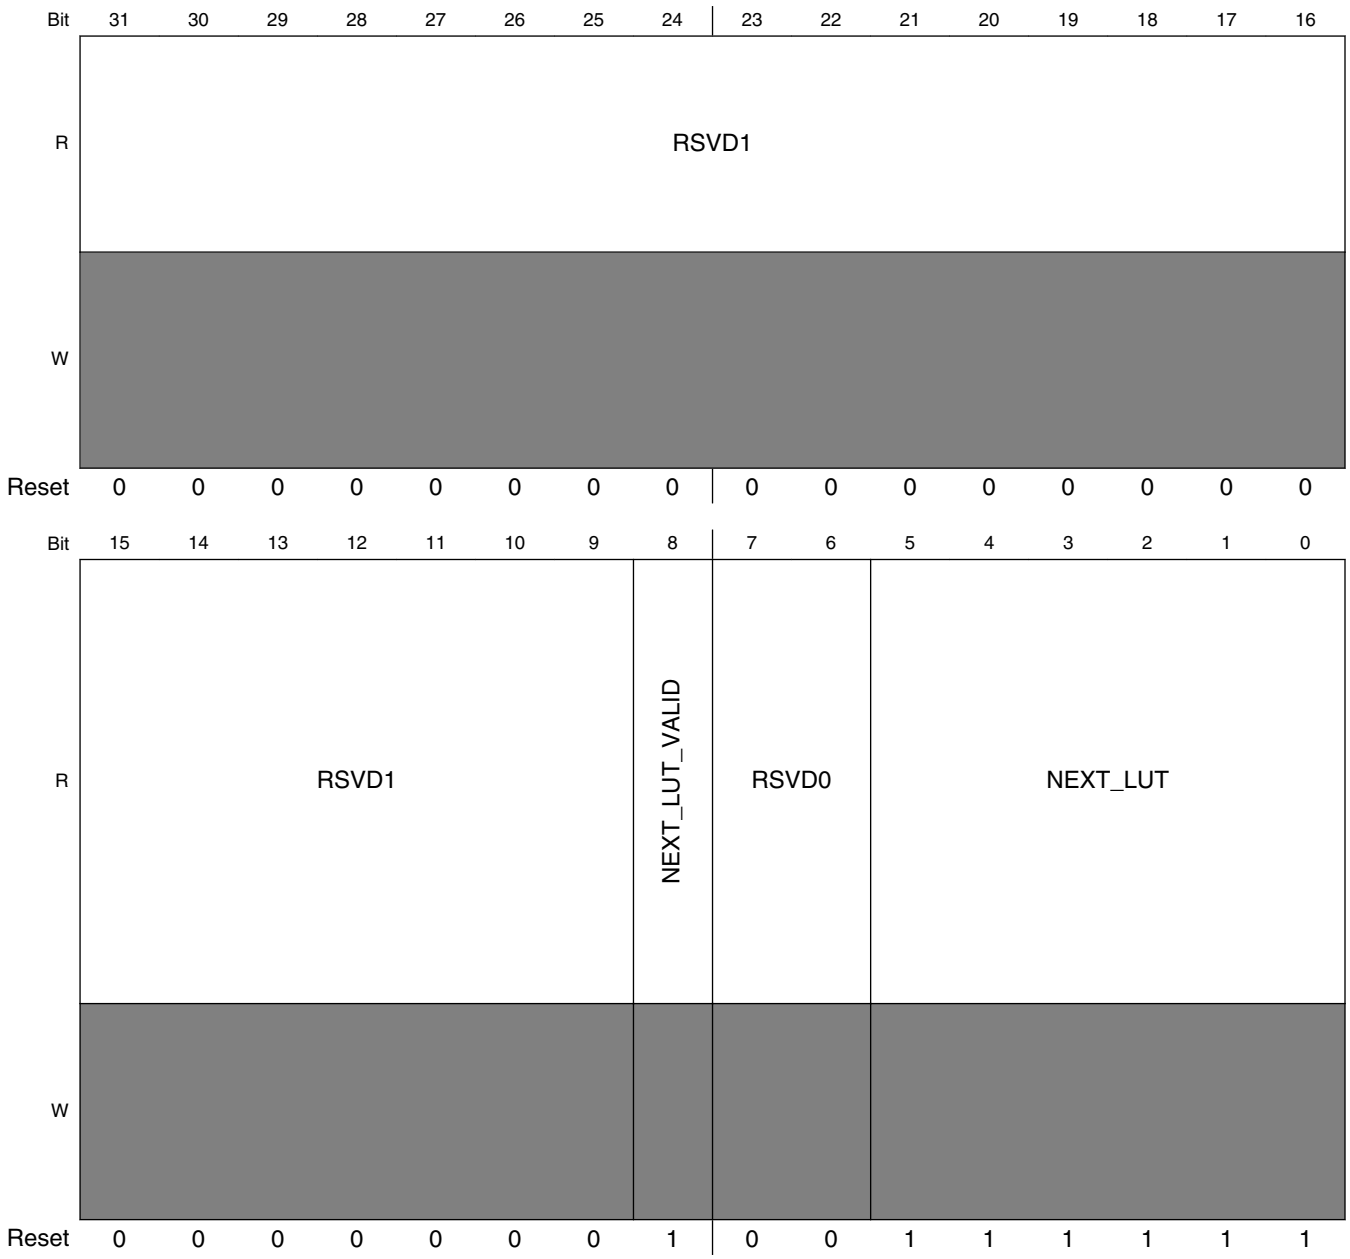
EPDC_STATUS_LUTS2*n* field descriptions



Field	Description
LUTN_STS	LUT 32~63 Status : 1=ACTIVE, 0=IDLE

24.4.36 EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT)

Holds value of next available LUT. Can be used for fast LUT assignment. This value can be read and then used in an update command as part of the HW_EPDC_UPD_CTRL register write

The DIGCTL Status Register provides a read-only view to various input conditions and internal states.

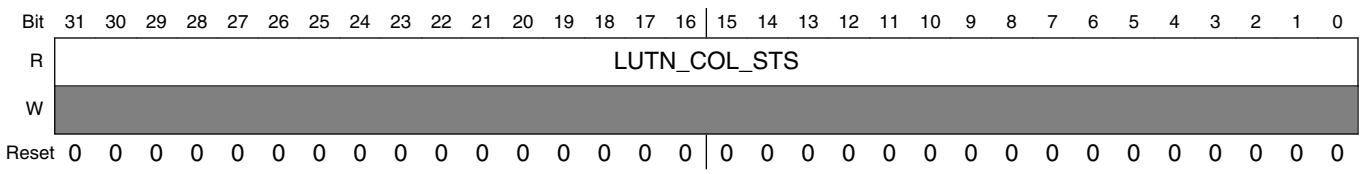
Address: 20F_4000h base + 460h offset = 20F_4460h

EPDC_STATUS_NEXTLUT field descriptions

Field	Description
31–9 RSVD1	Reserved.
8 NEXT_LUT_ VALID	This bitfield can be used to check against a LUTs full condition

Table continues on the next page...

EPDC_STATUS_NEXTLUT field descriptions (continued)



Field	Description
7–6 RSVD0	Reserved.
NEXT_LUT	Next available LUT value

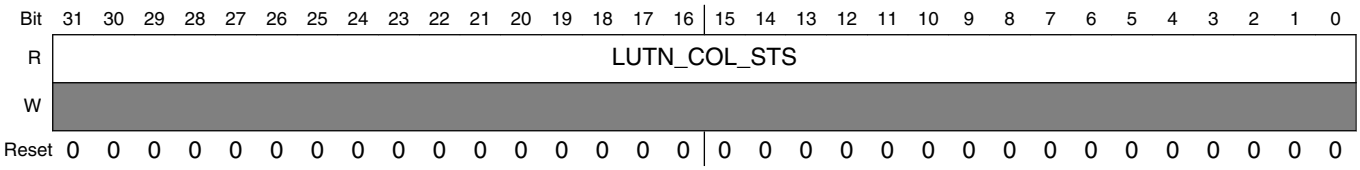
24.4.37 EPDC LUT Collision Status (EPDC_STATUS_COL1*n*)

EPDC LUT Collision Status Register and works in conjuction with HW_EPDC_IRQ[LUT_COL_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in HW_EPDC_IRQ_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit HW_EPDC_IRQ[LUT_COL_IRQ] clears this register

This register houses the status bits for the LUT Collisions

Address: 20F_4000h base + 480h offset + (4d × i), where i=0d to 3d

EPDC_STATUS_COL1*n* field descriptions



Field	Description
LUTN_COL_STS	LUTn Collision Status

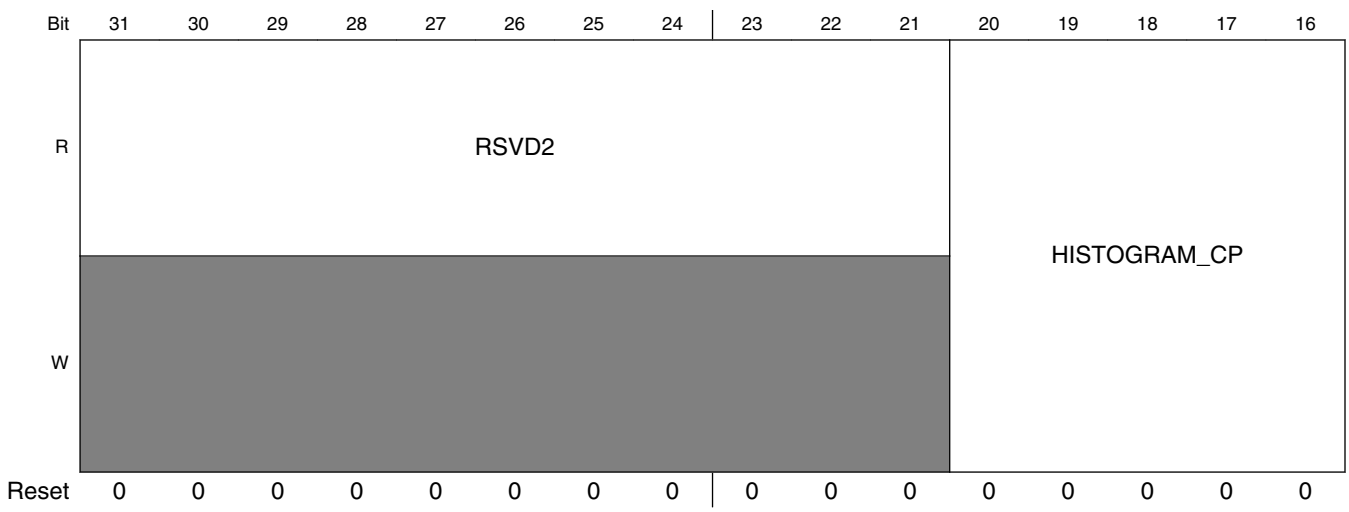
24.4.38 EPDC LUT Collision Status (EPDC_STATUS_COL2*n*)

EPDC LUT Collision Status Register and works in conjuction with HW_EPDC_IRQ[LUT_COL_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in HW_EPDC_IRQ_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit HW_EPDC_IRQ[LUT_COL_IRQ] clears this register

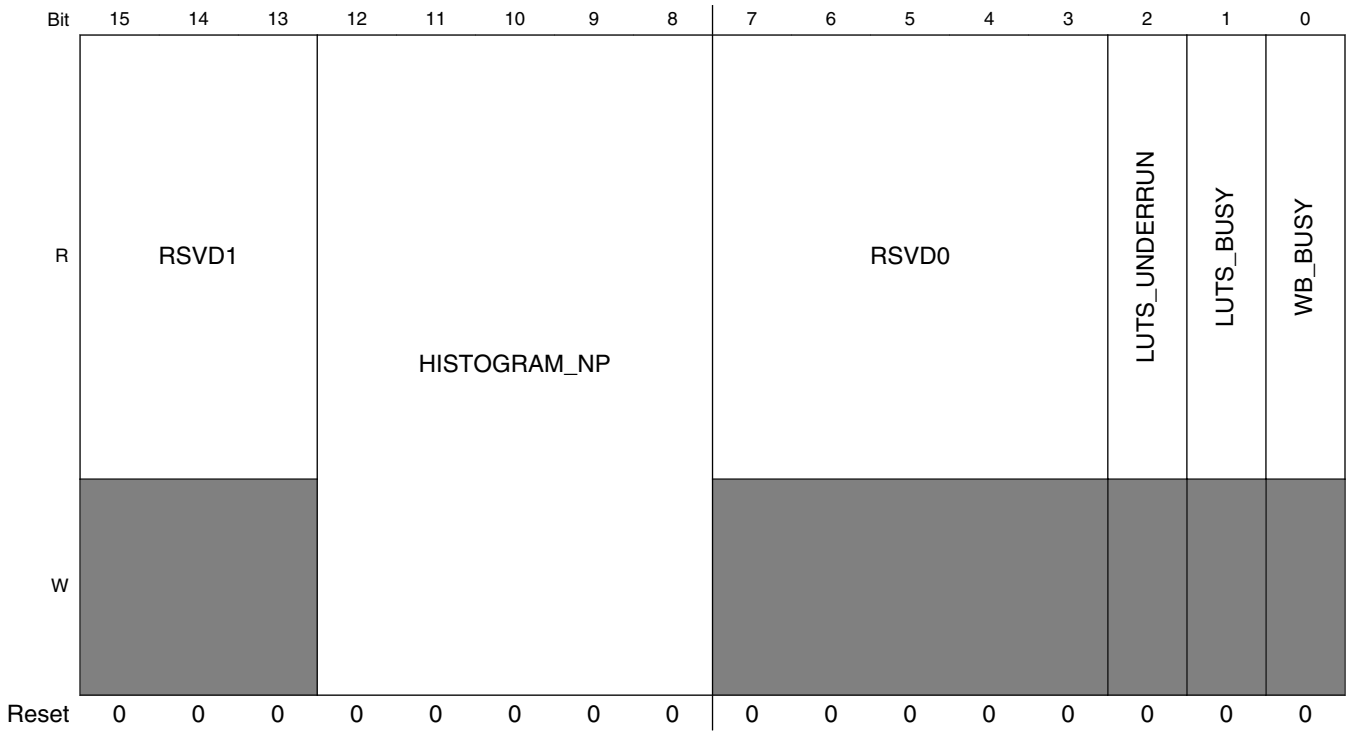
This register houses the status bits for the LUT Collisions

Address: 20F_4000h base + 490h offset + (4d × i), where i=0d to 3d

EPDC_STATUS_COL2*n* field descriptions



Field	Description
LUTN_COL_STS	LUTn Collision Status



24.4.39 EPDC General Status Register (EPDC_STATUS*n*)

Register to house non LUT specific status bits

This register houses general status bits

Address: 20F_4000h base + 4A0h offset + (4d × i), where i=0d to 3d

EPDC_STATUS*n* field descriptions

Field	Description
31–21 RSVD2	Reserved.
20–16 HISTOGRAM_CP	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 RSVD1	Reserved.
12–8 HISTOGRAM_NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–3 RSVD0	Reserved.
2 LUTS_UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLDOFF.

Table continues on the next page...

EPDC_STATUS*n* field descriptions (continued)

Field	Description
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

24.4.40 EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD)

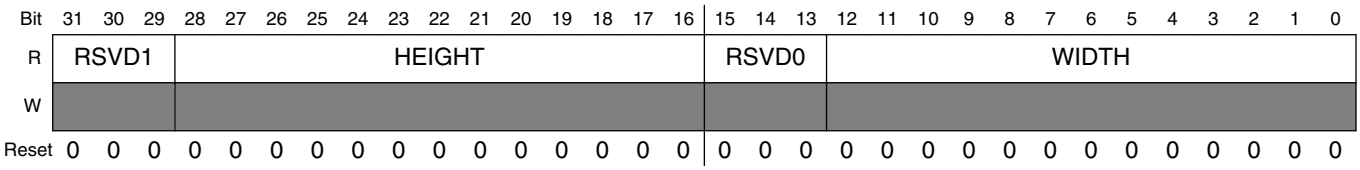
EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 20F_4000h base + 4C0h offset = 20F_44C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1			YCORD													RSVD0			XCORD												
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EPDC_UPD_COL_CORD field descriptions



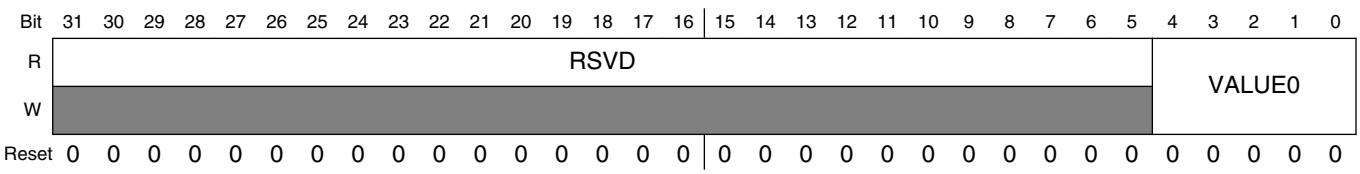
Field	Description
31–29 RSVD1	Reserved.
28–16 YCORD	Y co-ordinate for collision region of the latest completed update
15–13 RSVD0	Reserved.
XCORD	X co-ordinate for collision region of the latest completed update

24.4.41 EPDC Collision Region Size (EPDC_UPD_COL_SIZE)

EPDC Collision Region Size of the latest completed update cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 20F_4000h base + 4E0h offset = 20F_44E0h



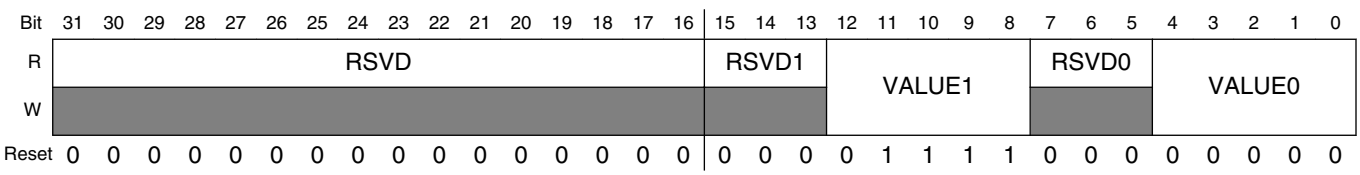
EPDC_UPD_COL_SIZE field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 RSVD0	Reserved.
WIDTH	Width (in pixels)

24.4.42 1-level Histogram Parameter Register. (EPDC_HIST1_PARAM)

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 600h offset = 20F_4600h



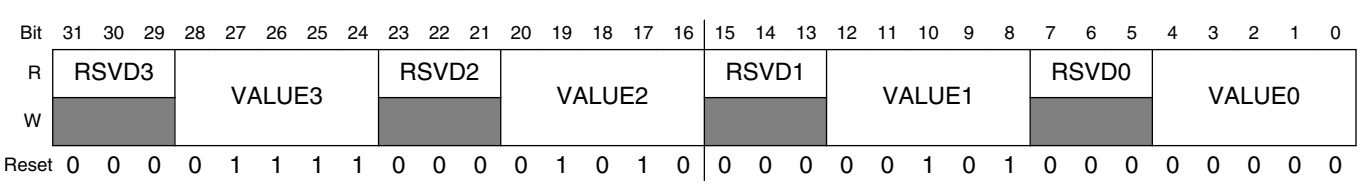
EPDC_HIST1_PARAM field descriptions

Field	Description
31–5 RSVD	Reserved, always set to zero.
VALUE0	value for 1-level histogram

24.4.43 2-level Histogram Parameter Register. (EPDC_HIST2_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match these two values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 610h offset = 20F_4610h



EPDC_HIST2_PARAM field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	White value for 2-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	Black value for 2-level histogram

24.4.44 4-level Histogram Parameter Register. (EPDC_HIST4_PARAM)

This register specifies the valid values for a 4-level histogram. If all pixels in a bitmap match these two values, STATUS[1] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 620h offset = 20F_4620h

EPDC_HIST4_PARAM field descriptions

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 (White) value for 4-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 4-level histogram
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 4-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 4-level histogram

24.4.45 8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0)

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 630h offset = 20F_4630h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_HIST8_PARAM0 field descriptions

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 value for 8-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 8-level histogram

Table continues on the next page...

EPDC_HIST8_PARAM0 field descriptions (continued)

Field	Description
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 8-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 8-level histogram

24.4.46 8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1)

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 640h offset = 20F_4640h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_HIST8_PARAM1 field descriptions

Field	Description
31–29 RSVD7	Reserved, always set to zero.
28–24 VALUE7	GRAY7 (White) value for 8-level histogram
23–21 RSVD6	Reserved, always set to zero.
20–16 VALUE6	GRAY6 value for 8-level histogram
15–13 RSVD5	Reserved, always set to zero.
12–8 VALUE5	GRAY5 value for 8-level histogram
7–5 RSVD4	Reserved, always set to zero.
VALUE4	GRAY4 value for 8-level histogram

24.4.47 16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 650h offset = 20F_4650h

EPDC_HIST16_PARAM0 field descriptions

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 value for 16-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 16-level histogram
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 16-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 16-level histogram

24.4.48 16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT_PIXEL_FORMAT control field.

Address: 20F_4000h base + 660h offset = 20F_4660h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

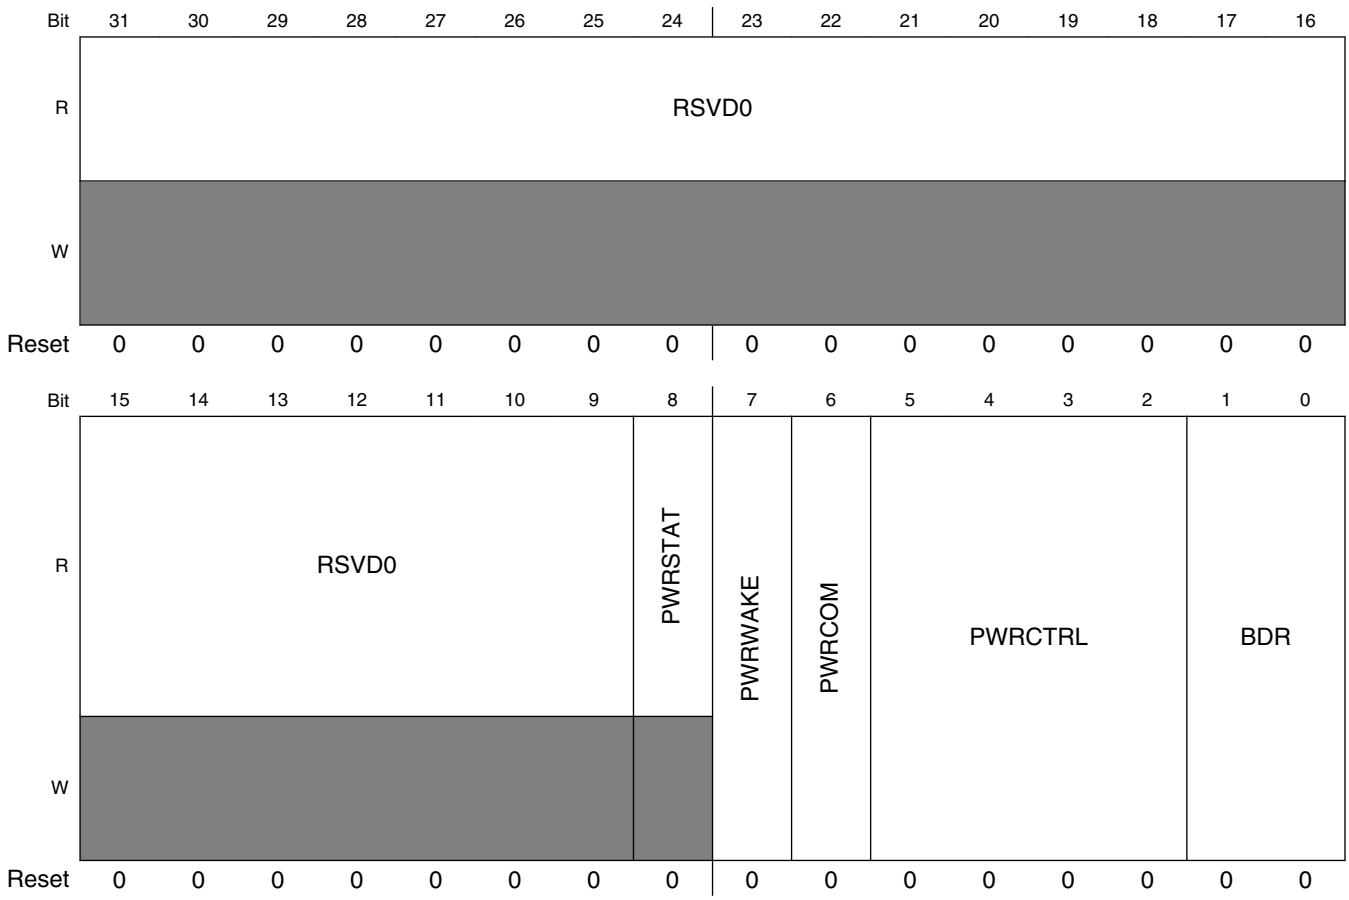
EPDC_HIST16_PARAM3 field descriptions

Field	Description
31–29 RSVD15	Reserved, always set to zero.
28–24 VALUE15	GRAY15 (White) value for 16-level histogram
23–21 RSVD14	Reserved, always set to zero.
20–16 VALUE14	GRAY14 value for 16-level histogram
15–13 RSVD13	Reserved, always set to zero.

Table continues on the next page...

EPDC_HIST16_PARAM3 field descriptions (continued)



Field	Description
12–8 VALUE13	GRAY13 value for 16-level histogram
7–5 RSVD12	Reserved, always set to zero.
VALUE12	GRAY12 value for 16-level histogram

24.4.51 EPDC General Purpose I/O Debug register (EPDC_GPIO*n*)

GPIO register to control BDR[1:0], EPDC_PWR_CTRL[3:0] and EPDC_PWR_COM output signals

Houses software control signal reisters

Address: 20F_4000h base + 700h offset + (4d × i), where i=0d to 3d

EPDC_GPIO*n* field descriptions

Field	Description
31–9 RSVD0	Reserved.
8 PWRSTAT	reflect ipp_epdc_pwrstat input
7 PWRWAKE	Controls ipp_epdc_pwrwake output
6 PWRCOM	Controls ipp_epdc_pwrcom output
5–2 PWRCTRL	Controls ipp_epdc_pwrctrl[3:0] output
BDR	Controls ipp_epdc_bdr[1:0] output

24.4.52 EPDC Version Register (EPDC_VERSION)

This register reflects the version number for the EPDC.

EXAMPLE

```
No Example.
```

Address: 20F_4000h base + 7F0h offset = 20F_47F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_PIGEON_6_1 field descriptions

Field	Description
31–16 CLR_CNT	deassert signal output when counter match this value 0x0 **CLEAR_USING_MASK** — keep active until mask off
SET_CNT	assert signal output when counter match this value 0x0 **START_ACTIVE** — start as active

24.4.73 Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_2)

parameters for timing signal generation

Address: 20F_4000h base + 9A0h offset = 20F_49A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EPDC_PIGEON_6_2 field descriptions

Field	Description
31–9 -	This field is reserved. Reserved.
8–4 SIG_ANOTHER	select another signal for logic operation or as mask or counter tick event
SIG_LOGIC	logic operation with another signal sigout : final output signal of this generator mask : final mask of this generator this_sig : intermediate signal of this generator before logic operation other_masks : intermediate mask result of this generator before logic operation sig_another : signal selected other generators 0x0 **DIS** — no logic operation 0x1 **AND** — sigout = sig_another AND this_sig 0x2 **OR** — sigout = sig_another OR this_sig 0x3 **MASK** — mask = sig_another AND other_masks

24.4.74 Panel Interface Signal Generator Register 7_0 (EPDC_PIGEON_7_0)

parameters for timing signal generation

Address: 20F_4000h base + 9C0h offset = 20F_49C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	STATE_MASK								MASK_CNT							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	MASK_CNT				MASK_CNT_SEL				OFFSET				INC_SEL		POL	EN
Reset	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0

EPDC_PIGEON_7_0 field descriptions

Field	Description
31–24 STATE_MASK	state_mask = (FS|FB|FD|FE) and (LS|LB|LD|LE) , select any combination of scan states as reference point for local counter to start ticking 0x80 **FS** — FRAME SYNC 0x40 **FB** — FRAME BEGIN 0x20 **FD** — FRAME DATA 0x10 **FE** — FRAME END 0x8 **LS** — LINE SYNC 0x4 **LB** — LINE BEGIN 0x2 **LD** — LINE DATA 0x1 **LE** — LINE END
23–12 MASK_CNT	When the global counter selected through MASK_CNT_SEL matches value in this reg, pigeon local counter start ticking. 0=disable
11–8 MASK_CNT_SEL	select global counters as mask condition, use together with MASK_CNT 0x0 **HSTATE_CNT** — pclk counter within one hscan state 0x1 **HSTATE_CYCLE** — pclk cycle within one hscan state 0x2 **VSTATE_CNT** — line counter within one vscan state 0x3 **VSTATE_CYCLE** — line cycle within one vscan state 0x4 **FRAME_CNT** — frame counter 0x5 **FRAME_CYCLE** — frame cycle 0x6 **HCNT** — horizontal counter (pclk counter within one line) 0x7 **VCNT** — vertical counter (line counter within one frame)
7–4 OFFSET	offset on pclk unit. 0=aligne with data, positive value means delay, minus value mean ahead. Supported range depends on panel mode
3–2 INC_SEL	event to incrment local counter 0x0 **PCLK** — pclk 0x1 **LINE** — line start pulse 0x2 **FRAME** — frame start pulse 0x3 **SIG_ANOTHER** — use another signal as tick event
1 POL	polarity of signal output 0x0 **ACTIVE_HIGH** — normal signal (active high) 0x1 **ACTIVE_LOW** — inverted signal (active low)
0 EN	enable pigeon mode on this signal

24.4.75 Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_1)

parameters for timing signal generation

Address: 20F_4000h base + 9D0h offset = 20F_49D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
